Pilot plant scale studies in the waste treatment capabilities of the reverse osmosis process for the concentration of dilute effluents of the pulp and paper industry are reported. Three demonstrations involving calcium sulfite, ammonia, sulfite and neutral sulfite wastes are discussed and the test results are analyzed. The pilot unit was designed to handle waste volumes of between 20,000 to 100,000 gpd under field conditions when operating at 600 psi with the prospect of the concentrate stream containing 7 to 10% solids. Average data indicated that the unit rejected more than 98% of color; 88 to 97% of inorganic primary pulping ions (Ca, Na, NH3); 87 to 95% of chemical oxygen demand and dissolved solids; and 70 to 88% of BOD. BOD rejection was found to be less for wastes containing low molecular weight organic volatiles. Operating problems including membrane fouling and sealing, membrane life and membrane flux regeneration are discussed. Cost estimates are provided for full-scale operations on the basis of these studies. (Sorber-Texas)

DISINFECTION (LITERATURE REVIEW),
Cincinnati Univ., Ohio. Dept. of Civil Engineering.
Riley N. Kinman, and H. A. Faber.
Journal Water Pollution Control Federation, Vol 42, No 6, p 949-952, June 1970. 22 ref.

Descriptors: *Chlorination, *Disinfection, *Chlorine, *Radiation, Waste water treatment, *Disinfection.
Identifiers: Bromine, Rapid sand filtration.

Several reports have discussed the various chlorine-providing compounds utilized for disinfection of waste water. The characteristics and costs of each were discussed and it was found that equal results might be obtained in waste water disinfection with either chlorine or the kypochlorites. The effects of chlorine on algae and different viruses were presented. Complete algae kill was caused by 10 mg/l chlorine at 2 hour contact. A combined chlorine residual of 40 mg/l (measured amperometrically) provided 99.99 percent destruction of the type I poliovirus in settled waste water with 30 minutes contact time. The studies indicated that present chlorination practices (1 mg/l residual) were totally inadequate for a high level of virus inactivation. Several reports investigated the use of radiation for disinfection treatment of waste water. It was found that without synergistic effect, radiation disinfection cost using Cobalt 60 would be prohibitive for general waste water treatment. Different types of methods for disinfection of waste water were outlined including the use of bromine, chlorine-bromine, and iodine, as well as chlorine. One report studied the removal of nematodes by rapid sand filtration since present methods of disinfection (chlorination) seemed to have little effect on the distruction of nematodes. The predominant factor in determining the percent of nematode removal was the percent of motile nematodes in the influent regardless of sand size. (Waid-Texas)

WASTE TREATMENT BY AEROBIC TECHNIQUES,
Department of National Health and Welfare, Kingston (Ontario).
Peter M. Higgins.
Developments in Industrial Microbiology, Vol 9, 1968, p 146-159. 9 fig, 4 tab, 13 ref.

Descriptors: *Aerobic treatment, *Activated sludge, *Lagoons, *Trickling filters, *Sewage treatment, *Aeration, Anaerobic digestion, Cost, Sludge, Waste water treatment.
Identifiers: Dispersed growth, Modified activated sludge process, Extended aeration, Contact stabilization, Complete mixing.

In biological systems microorganisms continuously remove organic matter from liquid waste by synthesis into new protoplasm. The activated sludge process biologically degrades waste, through aeration into microbial mass. The active mass is separated in clarifiers then either discharged or recycled and the clear effluent is discharged to the receiving stream or given further treatment. Several basic activated sludge process variants: dispersed growth, high rate or modified, conventional, total, oxidation or extended aeration, contact stabilization and complete mixing are discussed. In trickling filters the removal of organic matter is accomplished by adsorption at the surface of biological slimes covering the filter media. The adsorbed organic compounds are hydrolized and utilized by the attached slimes for growth and energy. Variations of the trickling filters were described, including low rate, high rate and super rate filters. The third aerobic process discussed was lagoons in which aerobic conditions are produced by algae. It has been shown however that conventional ponds are actually 75% anaerobic at all times. PHYSICAL AND CHEMICAL METHODS (LITERATURE REVIEW),
Federal Water Pollution Control Administration, Cincinnati, Ohio.
Jesse M. Cohen.
Journal Water Pollution Control Federation, Vol 42, No 6, p 971-983, June 1970. 88 ref.

Descriptors: *Reclaimed water, *Reclamation, *Tertiary treatment, Demineralization, Adsorption, Coagulation, Flocculation, Sedimentation, Flotation, Filtration, Ion exchange.
Identifiers: Phosphorus removal, Polymeric flocculants, Precipitating agents.

Reports were given discussing the use of physical-chemical processes in waste water treatment. Among the topics presented were water supply, water quality requirements, waste water treatment, and methods of sludge disposal. The reclaimed water was then utilized in a variety of applications in industry, i.e., cooling and irrigation. A variety of

chemical techniques for phosphorus removal was presented which included precipitation with aluminum, ferric salts, lime, sodium aluminate and polyelectrolytes. The advantages, disadvantages and costs of these techniques were given. Several pilot plant studies evaluated the carbon adsorption process and summarized a full-scale application. A report also described a laboratory-scale reactivation unit for powdered activated carbon. A variety of reports presented different aspects of the coagulation-flocculation process. The studies included the use of alum and lime as coagulants, the effect of particle size on turbidity removal, and the interactions of colloidal dispersions with electrolytes. The cost and effectiveness of synthetic flocculants were also evaluated. Sedimentation and flotation were the subject of several reports. The tube clarification process, microflotation techniques, foam separation of powdered activated carbon, and removal of Chlorella ellipsoidea from suspension were investigated and reported. (Waid-Texas)

WATER RECLAMATION AND REUSE (LITERATURE REVIEW),
Clemson Univ., S.C. Dept. of Environmental Systems Engineering.
Thomas M. Keinath.
Journal Water Pollution Control Federation, Vol 42, No 6, p 952-963, June 1970. 77 ref.

Descriptors: *Water reuse, *Reclaimed water, *Reclamation, Flotation, Filtration, Foam fractionation, Chloronation, Activated carbon, Diatomaceous earth, Electrodialysis, Reverse osmosis, Waste water treatment.
Identifiers: *Municipal waste water reclamation, *Industrial waste water reclamation, Ammonia stripping, Recarbonation-stabilization, Microstraining, Flash evaporization.

Because of the convergence of the diminishing supply of water and the expanding demands placed on that supply, the advanced-level treatment and reuse of waste water has gained increasing recognition as a keystone to total water resources management. Several reports discussed the concepts of water resource development including importation, conservation, total use, and reuse. Programs for municipal waste water reclamation of several cities were outlined including provisions for flotation, ammonia stripping, recarbonation-stabilization, sand filtration, foam fractionation, chlorination, and activated carbon filtration. General aspects of industrial waste water reclamation were discussed and treatment processes for a variety of different industries were outlined. More rigid requirements for waste water disposal have intensified the reuse of water and intensified the interest in various unit processes that might be utilized for renovating waste waters to meet effluent and/or reuse criteria. Several reports discussed in detail and gave cost information for various advanced-level unit operations. Included in these discussions were microstraining, diatomaceous earth filtration, dual-media filtration, adsorption on granular activated carbon, chemical oxidation, flash evaporation, electrodialysis, freezing, reverse osmosis, phosphate precipitation, and air-stripping of ammonia. Waste water reclamation by indirect cycle through irrigation and direct injection for groundwater recharge was also discussed. (Waid-Texas)

COAL AND COAL MINE DRAINAGE (LITERATURE REVIEW),
Bituminous Coal Research Inc., Monroeville, Pa.
James F. Boyer.
Journal Water Pollution Control Federation, Vol 42, No 6, p 1179-1185, June 1970. 49 ref.

Descriptors: *Coal mine waste, *Coal mines, *Water pollution sources, *Water pollution treatment, *Acid mine water, Cost, Hydrologic aspects, Waste water treatment.
Identifiers: *Acid mine drainage, Strip mine lakes, Lime slurry, Mine drainage pollution control.

The Bituminous Coal Research, Inc. compiled a bibliography of abstracts which were published by the Pennsylvania Department of Mines and Mineral Industries. The most comprehensive report, prepared by the Appalachian Regional Commission gave an in-depth study of the sources, occurrences, control techniques and impact on public facilities of acid mine drainage in Appalachia. The report estimated a cost of $6.6 billion for mine drainage pollution control and abatement. Several other reports documented the effect of mine drainage on water quality and groundwater in smaller geographic areas. The formation of acid mine drainage including all reaction from the oxidation of pyrite to the subsequent release of acidity, was the subject of several reports. The reports indicated that pyrite is rapidly oxidized by ferric ions, and oxygen was necessary only for the oxidation of ferrous ions which is a slower reaction and thus the rate determining step. Reports discussing the treatment of acid mine drainage indicated processes using a lime slurry or limestone proved to be the most economic and practical. Reports involving special treatment problems were also presented. They included high ferrous iron content mine water treatment, use of inert gases to eliminate acid pollution from abandoned deep mines and the effectiveness of mine drainage pollution control measures, as applied at an abandoned mine site. (Waid-Texas)

WASTE WATER AND STORM FLOW TREATMENT (LITERATURE REVIEW),
D. J. Weiner.
Journal Water Pollution Control Federation, Vol 42, No 6, p 963-969, June 1970. 42 ref.

Descriptors: *Waste disposal, *Sewerage, *Sewers, *Overflow, *Municipal waste, Waste water treatment.
Identifiers: Sewerage systems, Stormwater, Storm sewers.

The role of waste water transportation, control, and treatment was being reemphasized as part of the requirements in improved control and improvement of the environment. New communities have demanded sewerage services and older municipalities expanded sewage facilities into new areas as they found that residents expected to receive adequate sewage services. Sewers continue in importance as an economical and efficient means of waste disposal. Several reports presented various aspects and problems connected with different types of pipes for sewage use. These included clay pipes, concrete pipes, asbestos concrete pipes and PVC pipes. Maintenance programs and safety programs were described in several papers. Also presented were construction programs incorporating pipe testing and root control methods for new and renovated sewers. The control and treatment of overflows from combined sewers have attracted attention and interest of several papers as the total water pollution control program grows. Regulation and treatment of overflows have been investigated in the United States and other countries. A variety of programs in several cities for treatment of the combined sewer overflows were discussed. (Waid-Texas)

CONTROL MECHANISMS OPERATIVE IN A NATURAL MICROBIAL POPULATION SELECTION FOR IT'S ABILITY TO DEGRADE L-LYSINE,
Oklahoma State Univ., Stillwater. Bioengineering Labs.
C. P. L. Grady, Jr., A. F. Gaudy, Jr., and Elizabeth T. Gaudy.
Applied Microbiology, Vol 18, No 5, p 776-784, November 1969. 5 fig, 2 tab, 21 ref. FWPCA Grant WP-00786.

Descriptors: *Microorganisms, *Bacteria, *Control, *Maintenance, *Growth rate, *Chemical oxygen demand, Inhibition, Enzymes, Waste water treatment.
Identifiers: *Induction, *Repression, *Catabolite-repression, Lysine, Bacterial population, Replica ploting, Enzymatic capacity, Substrate concentration.

The purpose of the study is to discover the nature of certain metabolic control mechanisms such as induction, repression and catabolite repression in microbial populations. A natural microbial population was selected in a medium containing L-lysine as the sole carbon source and ammonia as the nitrogen source. Experiments were performed at room temperature. Cells were harvested from a batch-operated fermentor containing lysine and were grown through one transfer on lysine, glucose or a mixture of lysine and glucose. By comparing the substrate removal rates and enzymatic capabilities of the cells, it was determined that inducible enzyme systems responsible for lysine degradation were subject to catabolite repression. It was noted that the presence of flucose in the medium decreased the differential rate of activity of the cultures. Results of replica ploting showed that all species in the population were capable of participating in the overall response. Glucose represented the formation of the inducible lysine degrading system and metabolic intermediates also exerted the effect. Glucose had no inhibitory effect upon the activity of preformed enzymes. Preinduction by lysine offered only a small degree of protection against repression, but omission of ammonia-nitrogen from the system did not overcome it. (Shankar-Texas)

PAPER AND ALLIED PRODUCTS (LITERATURE REVIEW),
Tufts Univ., Medford, Mass.
George W. Gove, and I. Gellman.
Journal Water Pollution Control Federation, Vol 42, No 6, p 1138-1160, June 1970. 128 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Pulp and paper industry, Water pollution, Biology, Instrumentation, Reverse osmosis, Water reuse, Sludge, Activated sludge, Lagoons, Trickling filters, Ponds.
Identifiers: *Physical-chemical treatment.

Effects of federal and state legislation pertaining to air and water pollution of pulp and papermaking is discussed. The increasing severity of: black liquor spills, color, foam, training of operating personnel, improving sludge handling, technology, etc. is discussed. Factors affecting the appearance of surface waters including natural phenomena were reviewed. The use of ocean outfalls for disposal of pulp mill wastes were studied to determine the dilution and dispersant characteristics of existing effluents through the use of aerial photogrammetry techniques and flourimetric analysis. Several investigations were made on the biochemical oxygenation characteristics of cellulose fibers, the organisms responsible for the degradation of pulp and paper wastes, and the ecological effects of discharging these wastes to rivers. Several method for monitoring the treated effluent are discussed for a wide variety of parameters. A large number of methods are discussed for pulping liquor disposal and recovery; these include the uses of chemical treatment for recovery, reverse osmosis, by-processing, and a wide variety of physochemical treatment methods. The potential reuse of water from many of the sub-systems within paper mills is appraised. Various mill facilities are described in regard to the secondary treatment processes including activated sludge, oxidation lagoons, aerated stabilization basins, trickling filters, and spray irrigation. REMOVAL OF ORGANIC NITRILES FROM WASTE WATER SYSTEMS,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
Philip A. Lutin.
Journal Water Pollution Control Federation, Vol 42, No 9, p 1632-1642, September 1970. 1 fig, 7 tab, 6 ref.

escriptors: *Waste water treatment, *Organic ompounds, *Industrial wastes, Activated sludge, xidation.
entifiers: *Nitriles, *Cyanides, Removals.

xidation of organic nitriles were reflected by ox-gen uptake measured on Warburg constant-olume respirometers. Three activated sludges om different types of aerobic treatment plants in e Nashville, Tennessee area were run with each the nitriles tests. The organic nitriles tested were vided into 3 groups: (1) mononitriles, (2) nitriles and (3) aromatic nitriles. The alkanes and onocarboxylic acids corresponding to the nitriles ith regard to the number of carbon atoms in the olecules were studied to determine the effect of rminal grouping on biological oxidation. At a ncentration of 500 mg/l mononitriles are toxic or ry resistant to biological oxidation at 6 hours and hours. At the same concentration dinitriles are xic or extremely resistant to biological oxidations r detention times up to 72 hours. Aromatic triles showed a toxic effect on all three sludge and rongly resisted biological oxidation. Presence of e cyanide group reduces the susceptibility of a olecule to biological oxidation by activated udge. (Hancuff-Texas)

ERFORMANCE OF DEEP TRICKLING FIL-ERS BY FIVE METHODS,
egional Inst. of Tech., Jamshedpur (India).
. Hanumanulu.
ournal Water Pollution Control Federation, Vol 2, No 8, p 1446-1457, August 1970. 2 fig, 5 tab, 7 ref.

escriptors: *Trickling filters, *Waste water treat-ent, *Design, *Performance, Sewage treatment, ilters, Data collection, Efficiencies.
lentifiers: *Formulas, Recirculation.

he applicability of five methods for predicting the erformance of deep trickling filters were studied: elz, National Research Council, Ten States, ckenfelder, and Galler and Gotaas. It was con-luded that Velz law cannot be applied beyond a lter depth of 6 feet or where there is recirculation. he NRC formula underestimates the performance ecause the full effect of the depth of the filter is rought into play by recirculation. Efficiency cal-ulated by the Ten States formula depended only n recirculation and in comparison with Velz and NRC formulas predictes results that are closer to bserved values. The Eckenfelder formula gave the est predicted values in the case of filter with recir-ulation. Efficiencies predicted by the Eckenfelder ormula in the case of a filter without recirculation re far from the actual case. The values predicted y the Galler and Gotaas formula are only slightly etter than those found by the Eckenfelder formula n the case of a filter without recirculation. In the ase of a filter with recirculation, the Galler and Gotaas formula is close to the Eckenfelder formula. f the Galler and Gotaas formula is modified so that he depth term exponent is a linear function of ecirculation volumn it becomes equally applicable o filters with and without recirculation. SEPTIC TANK SYSTEMS,
Brown and Caldwell, San Francisco, Calif.
J. A. Cotteral, Jr., and D. P. Norris.
Journal of the Sanitary Engineering Division, Proceedings American Society of Civil Engineers, Vol 95, No SA1, 715-746, February 1969. 4 fig, 5 tab, 39 ref.

Descriptors: *Design, *Septic tanks, *Sewage disposal, *Maintenance, Design criteria, Design standards, Drainage systems, Performance, Pollution abatement, Sewage treatment, Soil disposal fields, Soil properties, Waste water treatment.
Identifiers: *Drainfields, Capacity, Requirements.

In areas without community sewerage, the installation of individual sewage disposal systems ranges from simple cesspools to complex aerobic treatment units. The most common type of individual sewage disposal system consists of a septic tank and drainfield. The historically high failure rate of septic tank systems has shown them to be unreliable and unpredictable. However, it is possible to design, construct and operate systems in suitable areas for which a high degree of reliability over a reasonable life period can be expected. A minimum septic tank capacity of 1200 gal. should be provided, with an additional 250 gal. per bedroom for homes larger than four bedrooms. Septic tanks should be water tight, constructed of reinforced concrete or precast concrete with reinforced top, and should be 2-compartment tanks of standard proportions as required by the USPHS Manual of Septic Tank Practice. Septic tanks should receive all domestic, laundry, and sanitary wastes, but should exclude roof and area drainage and groundwater. Tanks should have a minimum of 8 in. of cover. Drainfield trenches should be a minimum of 12 in. and a maximum of 18 in. wide and not less than 50 ft nor more than 100 ft. in length. A loading rate of 600 sq. ft. per bedroom is recommended. (Aguirre-Texas)
W71-01842

FOAM SEPARATIONS FOR INDUSTRIAL WASTES: PROCESS SELECTION,
Kentucky Univ., Lexington. Dept. of Chemical Engineering.
Robert B. Grieves.
Journal Water Pollution Control Federation, Vol 42, No 8, Part II, p R336-R344. 7 fig, 2 tab, 18 ref.

Descriptors: *Industrial wastes, *Foam separation, *Chromium foam fractionation, Waste water treatment, Air, Aeration, Costs, Design, Chemical precipitation.
Identifiers: *Treatment processes, Flotation, Chemical removal, Clarification.

Foam separations have been shown to be feasible in a number of waste treatment applications. Two parameters, one a concentration ratio and the other a quantity ratio have been indicated to be particularly useful in evaluating the effects on the extent of separation of key independent variables. Frequently the process choice may be left to the design engineer. In this case he should select a process involving the flotation of colloidal or already precipated particles as opposed to the foam fractionation for ion flotation of soluble species. A variety of operational modifications are available. The two state precipitation flotation of Cr (III) hydroxide is a feasible process for the treatment of chronium wastes, with an operating cost of $0.67/lb Cr. An additional choice to be made is that between dissolved air and dispersed air foam separation. For the removal of sediments from natural waters the operating costs are $0.50/1000 gal for dispersed air and $0.60/1000 gal for dissolved air, producing excellent calcification of very turbid waters. (Hancuff-Texas)
W71-01843

ECONOMIC TRANSPORT OF DIGESTED SLUDGE SLURRIES,
Rand Development Corp., Cleveland, Ohio.
Bertram C. Raynes.
Journal Water Pollution Control Federation, Vol 42, No 7, p 1379-1386, July 1970. 2 fig, 2 tab, 31 ref.

Descriptors: *Sludge, *Transportation, *Costs, *Sludge disposal, Design, Pipelines, Land reclamation, Slurries, Waste water treatment.
Identifiers: *Digested sludge.

Pipeline transport of digested sludge to disposal areas located at considerable distance from the generating treatment plant may offer the waste water plant operators substantial economic benefits. The cost savings of transportation of the digested slurry is related to the distance, the quantity, the solids concentration and other variables. The sludge slurries vary in flow behavior as a function of solids concentration. At solids concentrations above 5% they behave as Bingham plastics while below 5% their behavior is Newtonian. Pipelining in the Newtonian region should be the most economical procedure despite the increased volumn of material to be transported. Even where dilution is practiced the quantity of digested sludge available from many waste water treatment plants dictates the use of pipelines perhaps as small as 2 inches in diameter. Another purpose of this investigation is to encourage the use of digested sludge slurries in the reclamation of land areas in need of revegatative assistance and in particular those strip mine areas or similar land areas that constitute water pollution problems in themselves. (Hancuff-Texas)

OPTIMUM WASTE TREATMENT PLANT DESIGN UNDER UNCERTAINTY,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
Paul M. Berthouex, and Lawrence B. Polkowski.
Journal Water Pollution Control Federation, Vol 42, No 9, p 1589-1613, September 1970. 9 fig, 8 tab, 32 ref.

Descriptors: *Waste water treatment, *Optimization, *Sewage treatment, *Design, Systems analysis, Costs, Statistics, Constraints, Activated sludge, Computer programs.
Identifiers: Uncertainty, Variants, Algorithms, Sensitivity.

Simple methods for evaluating the different sources of uncertainty that face the design area of waste treatment systems and incorporate waste treatment systems are outlined. The methods incorporated these evaluations into a systems optimization scheme. The design of the individual treatment plant is reviewed. Use of various estimates for the parameters to estimate uncertainty in process performance is discussed. A model of the activated sludge process is developed relating to the performance of primary and final clarifier. Formulas for developing cost data are presented. Penalty costs were used to simplify the calculations and force the optimum design to meet certain constraints. The Hooke-Geeves method is presented and discussed as an easily implimented method. (Hancuff-Texas)
W71-01845

INFLUENCE OF DOMESTIC WASTE WATER PRETREATMENT ON SOIL CLOGGING,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
R. Laak.
Journal Water Pollution Control Federation, Vol 42, No 8, Part I, p 1495-1500, August 1970. 2 fig, 2 tab, 9 ref.

Descriptors: *Sewage treatment, *Soils, *Waste water treatment, Percolation, Biochemical oxygen demand, Effluents, Aerobic treatment, Anaerobic conditions.
Identifiers: *Clogging, Suspended solids, Plugging.

Increase pretreatment of domestic waste water prior to soil application resulted in reducing the clogging rate of the soil surface. A laboratory study with 30 soil columns, 3 different soils and septic tank and extended aeration effluent was carried out. The soils were intermitantly loaded at 80 minute intervals with the effluent up to clogging failure which was reached within 180 days. The service of the soil surfaces was increased when the concentration of total suspended solids, BOD and the hydraulic loading were decreased. Total failure load expressed by the sum of total suspended solids and BOD was directly related to the non-capillary porosity of the soils. (Hancuff-Texas)
W71-01847

TREATMENT OF FRUIT PROCESSING WASTE BY AERATION,
Gray and Osborn, Yakima, Wash.

Larry A. Esvelt, and Hearbert H. Hart.
Journal Water Pollution Control Federation, Vol 42, No 7, p 1305-1326, July 1970. 13 fig, 5 tab, 16 ref. FWQA Grant WPRD 58-01-68.

Descriptors: *Industrial wastes, *Aeration, *Fruit crops, *Activated sludge, Waste water treatment, Biological treatment, Operations, Nutrients, Costs, Tanneries, Efficiency, Lagoon.
Identifiers: *Fruit processing, Growth.

The waste treatment system of a cooperative fruit processing cannery was studied for two operating seasons to determine treatment efficiency and to establish parameters for the treatment of liquid fruit processing wastes by aeration. The cannery processes pears, peaches, apples, and other fruits in a lesser amount. The facilities operate at a flow of 0.5 to 2.5 mgd and up to 25,000 lbs per day of BOD. Activated sludge or contact stabilization treatment of fruit processing waste at low rates will provide greater than 90% removal of organic load and solids from the effluent. Aerated lagoon treatment can provide greater than 80% BOD removal but suspended solids remain in the effluent. Final clarification is successful by low surface loading rates, less than 400 gpd per sq. foot. Nutrient addition is necessary to achieve successful treatment. The cost of the treatment is estimated at $0.41 per pound of BOD removed from aerated lagoons, $0.061 per pound of BOD removed from activated sludge and $0.067 per pound of BOD moved from contact stabilization. Data were collected on biological substrate assimilation, sludge growth, oxygen uptake and sludge settability. Constants were obtained for substrate removals, sludge growth rate, endogenous respiration and oxygen requirements. (Hancuff-Texas)
W71-01848

MEASUREMENT AND SIGNIFICANCE OF ADENOSINE TRIPHOSPHATE IN ACTIVATED SLUDGE,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
Ames W. Patterson, Patrick L. Brezonik, and Hugh D. Putnam.
Environmental Science and Technology, Vol 4, No 7, p 569-575, July 1970. 10 fig, 1 tab, 25 ref.

Descriptors: *Activated sludge, *Energy, *Biomass, Sewage treatment, Waste water treatment, Microbiology, Laboratory tests, Metabolism, Productivity.
Identifiers: *Adenosine triphosphate, Organisms, Theory.

A method for adenosine triphosphate (ATP) measurement in activated sludge has been developed from the firefly reaction of luciferin, luciferase, and ATP in which light production is proportional to ATP present. Of several technique variables investigated, temperature of ATP extraction from cells was found to be highly critical; extraction solutions a few degrees below boiling yield much less ATP. The finalized procedure is highly sensitive and reliable; relative standard deviations for activated sludge replicates are commonly less than 2% and recovery of added ATP from activated sludge are relatively constant 100%. ATP levels in activated sludge are relatively constant under endogenous conditions, indicating the potential of ATP as an estimate of viable biomass and respond rapidly to induced changes in metabolic activity. The advantages of an activity parameter over historically used biomass parameters for activated sludge operation control are manifold; ATP assay holds promise as a sensitive tool for future research on sludge activity and process control. (Hancuff-Texas)

GOOD MANAGEMENT INCLUDES EFFECTIVE SAFETY PROGRAMS,
Water Pollution Control Federation, Washington, D.C.
Bob G. Rogers.
Journal Water Pollution Control Federation, Vol 42, No 9, p 1614-1620, September 1970. 1 fig, 2 tab, 2 ref.

Descriptors: *Management, *Safety, *Administration, Cost, Insurance, Operations, Waste water treatment, Sewage treatment, Programs.
Identifiers: Injuries, Records.

Through surveys of waste water collection and treatment systems in the United States the Water Pollution Control Federation has determined that the safety record in the waste water pollution control field is worse than that in any of 41 industries reporting regularly to the National Safety Council. This poor record is costing the field more than $30,000,000 each year in added insurance cost, lost time and reduced productivity. Personnel morale and public image are among other factors sustaining damage but to which no monetary value may be assigned. The Federation has developed safety promotional materials aimed at first convincing management of the need for and value of safety programs and going on to furnish specific aids and training materials for safety. (Hancuff-Texas)

CHARGES FOR TREATING INDUSTRIAL WASTE WATER IN MUNICIPAL PLANTS,
World Health Organization; and John Hopkins Univ., Baltimore, Md. Dept. of Sanitary Engineering.
Yves Maystre, and John C. Geyer.
Journal Water Pollution Control Federation, Vol 42, No 7, p 1277-1291, July 1970. 2 fig, 6 tab, 3 ref.

Descriptors: *Industrial wastes, *Sewage treatment, *Cost, Waste water treatment, Mathematical models, Biochemical oxygen demand, Waste disposal.
Identifiers: *Charges, Suspended solids, Computations, Expenses.

A survey of current practices of charging for discharge of industrial waste into municipal sewers in the U.S.A. revealed that the surcharges may be expressed in a single form that takes into account the biochemical oxygen demand and suspended solids of the waste. A suggested two step procedure may be used to calculate the charges for domestic waste, waste from normal industries and the surcharges for industries with unusually strong wastes. The suggested approach provides for equitable charges which avoiding the expense of individual sampling of all industrial effluents. A set of sample calculations is given for a city treating 10,000 million gallons per year with an average BOD of 368 mg/l and 338 mg/l suspended solids. The total industrial waste water amounts to 3,850 million gallons per year. Four industries have been selected as having very high loads. The individual surcharge factors are calculated and applied to these four industries according to the nature of their flow and strength. (Hancuff-Texas)
W71-01851

INFILTRATION IN SEPARATE SANITARY SEWERS,
Riddle Engineering, Inc., Kansas City, Mo.
W. G. Riddle.
Journal Water Pollution Control Federation, Vol 42, No 9, p 1676-1683, September 1970. 4 fig.

Descriptors: *Infiltration, *Sewers, Costs, Runoff, Maintainance, Repairing, Storm runoff, Construction, Waste Water Treatment.
Identifiers: *Detection methods.

Results of a two year survey in the matter of eliminating infiltration and stormwater in sewage systems in Western Missouri and Eastern Kansas is reported. A questionaire was mailed to approximately 50 pollution abatement facility managers and 49 replied. Location of storm water inlets is made by a comprehensive, economical smoke testing program which allows visual identification of contributing roof leaders, street inlets, broken pipes, ruptured manholes and yard, driveway or area-way drains. Infiltration and its correction is a separate problem. Visual observation is practicable only by television or photography; however, a recent development which is receiving considerable and favorable attention is low pressure air testing. Once the exact or general location and character of infiltration has been determined the effects may be corrected in one of the following ways: (1) excavation and replacement or repair, (2) localized pressure grouting from within, (3) generalized low pressure sealing from within, (4) lining to a reduced diameter, (5) pressure grouting from without. Cost for the various methods are presented. The supplier of sealing chemical claims sealing efficiencies range from 70 to 95%. Costs of treating and 8 inch sewer ranged from 80 cents to a $1.00 a foot plus the cost of chemical. It is concluded that there is no satisfactory repair or maintainance substitute for high quality initial construction. (Hancuff-Texas)
W71-01852

FEASIBILITY OF A SPORT FISHERY IN TERTIARY TREATED WASTE WATER,
Arizona Cooperative Fishery Unit, Tucson.
Robert J. Hallock, and Charles D. Ziegell.
Journal Water Pollution Control Federation, Vol 42, No 9, p 1656-1665, September 1970. 3 fig, 4 tab, 20 ref.

Descriptors: *Tertiary treatment, *Fisheries, *Waste water treatment, *Feasibility studies, Fish farming, Filtration, Fish, Biomass, Food chains, Photosynthesis, Phosphours, Trout, Catfishes.

Specific objectives of this study were to determine a suitable fish species, their survival, growth and yield in tertiary treated waste waters and to evaluate food chain relationships. Physical and chemical parameters such as temperature, DO, pH, and orthophosphate were also considered. The tertiary treatment consisted of spreading activated sludge effluent over sand and gravel filters. Horizontal filtration distances varied from 50 to 100 feet while vertical filtration distances varied from 3 to 20 feet. Fish tested were channel catfish, rainbow trout, and Malacca tilapia hybrids. The final fish survival percentages differ greatly from pond to pond. In two of the three initial channel catfish experiments and in all the tilapia experiments survival exceeded 70%. Survival did not exceed 1% in any of 5 trout experiments. An important cause of death was the low oxygen concentration and high ammonia concentrations. Oxygen was measured as low as 2.7 mg/l and ammonia was as high as 11 mg/l. The large variation in oxygen concentrations seems to be a result of respiration by dense phytoplankton blooms which were stimulated by high inflow orthophosphate concentrations, 14 mg/l. The highest combined yield of locally acceptably channel catfish and talipia from one pond was 697 lbs per acre, yield much greater than that from natural waters. Chironimus larva, the predominant food organism, comprised 90% of the estimated annual benthos production of 12,680 lbs. per year per acre. (Hancuff-Texas)

A NEW APPROACH TO CONTROLING BIOLOGICAL PROCESSES,
Southwest Research Inst., San Antonio, Tex.
Leland L. Hiser.
Environmental Science and Technology, Vol 4, No 8, p 648-651, August 1970. 3 fig, 1 tab, 4 ref.

Descriptors: *Biological treatment, *Control, *Carbon, Waste water treatment, Sewage treatment, Biochemical oxygen demand, Energy.
Identifiers: Total oxygen demand, Volatile solids.

Some criticism is given of the current use of the BOD test as a control paramente for waste water treatment systems. It is felt that separate parameters to describe 3 distinct variables--food, energy, and culture--would lead to a simpler and more

idely understood concept of the biological ystem. Since carbon is a basic food supply of living natter, it is logical that it should be a primary arameter for describing both of the food supply nd the culture content from microbiological ystems. A simplified carbon nomenclature is used o describe the many forms in which carbon can be resent. In the liquid phase it includes dissolved or-anic carbon and dissolved inorganic carbon; the olid phase includes suspended organic carbon and uspended inorganic carbon, the gas phase includes as organic carbon and gas inorganic carbon. It is uggested that the energy requirement can be etermined as the total change in oxygen demand f the system coincident with the conversion of car-on. It is stated that this approach will assistin the reakdown of biological treatment process into a eries of describable unit operations which are menable to material balances and more precise escriptions of unit rate. Two advantages of this ype of analysis are: (1) analytical time is reduced rom days to minutes and (2) it is possible to make oth materials and energy balances. (Hancuff-Tex-s)

KINETICS OF THE MICROBIAL DECOMPOSI-TION OF THE HERBICIDES IPC AND CIPC,
Oregon State Univ., Corvallis. Dept. of Agricul-ural Chemistry.
Paul G. Moe.
Environmental Science and Technology, Vol 4, No , p 429-431, May 1970. 3 tab, 6 ref.

Descriptors: *Degradation (Decomposition), *Kinetics, *Herbicides, Microorganisms, Bacteria, Growth rated, Energy, Hydroloysis, Organic com-pounds, Soils, Waste water treatment.
Identifiers: Reactions.

ncubation instruments using IPC and CIPC as pri-nary carbon sources for the growth of Pseu-lomonas striata were conducted at 20 and 30C. Reaction rate constants for the initial hydrolysis reactions were calculated from an equation based n both the herbicide concentration and the bac-erial mass present in the system. The IPC concen-rations were 50, 100 and 200 ppm and because of he water solubility of CIPC concentrations of 25, 50 and 100 ppm were employed. Good bacterial growth was obtained in all the inoculated flasks. Lag periods varied considerably with initial herbi-cide concentration particularly with IPC, but averaged about 40 hours for IPC and about 130 hours with CIPC. The length of the logarithmic growth phase generally increased with the initial herbicide concentration ranging from 16 to 40 hours. The ratio of bacterial mass formed for the unit of herbicide decomposed, essentially a mea-surement of metabolic efficiency, varied from 6.8 to 9.2% with IPC and from 3.0 to 5.0% with CIPC. Activation energy required for the hydrolysis of IPC was about 4 K cal/mole whereas for the hydrol-ysis of CIPC it was 2 K cal/mole. (Hancuff-Texas)

DIGESTION FUNDAMENTALS APPLIED TO DIGESTER RECOVERY--TWO CASE STUDIES,
Iowa Univ., Iowa City. Dept. of Civil Engineering.
Richard Dague, Robert L. Hopkins, and Robert W. Tonn.
Journal Water Pollution Control Federation, Vol 42, No 9, p 1666-1675, September 1970. 2 fig, 2 tab, 16 ref.

Descriptors: *Control, *Digestion, *Anaerobic digestion, Hydrogen ion concentration, Alkalinity, Ammonia, Industrial wastes, Waste water treat-ment, Methane.
Identifiers: *Case studies, *Upset recovery, Volatile acids, Gas production.

The anaerobic digestion systems of concern are located at Clinton and Keokuk, Iowa. Both systems received significant solids from grain and processing industries. Initial conditions at Clinton were pH 5.5 to 6.0, volatile acids 4000 to 5000 mg/l, alkalinity 2000 mg/l, gas production 0. At Keokuk initial conditions were pH 6.0 to 6.3, volatile acids, 8000 mg/l, alkalinity 3,000 mg/l, gas production 0. Alkali was added to raise the pH to about 6.8. The recovery at Clinton showed significant gains only when the pH was greater than 6.5. Part way through the recovery period at Keokuk the addition of lime was halted in favor of aqueous ammonia. The use of ammonia to neutralize 10,000 mg/l of volatile acids resulted in ammonia toxicity and cessation of gas production. At this time the concentration of ammonia in the system was 2,500 mg/l as NH3. There is no apparent relationship between the concentration of volatile acids in the digester and the ranges of gas production. A definite relationship between pH and the rate of gas production is apparent; the minimum pH indicated is 6.5. (Hancuff-Texas)

PETROLEUM PROCESSING WASTES (LITERATURE REVIEW),
Maine Univ., Orono.
Millard W. Hall.
Journal Water Pollution Control Federation, Vol 42, No 6, p 1205-1211, June 1970. 31 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Oil costs, Design, Waste disposal, Biological treatment.
Identifiers: *Petroleum wastes, Refineries.

Recent literature in the petroleum processing wastes area is summarized. A large scale joint industry waste disposal facility on the Houston ship channel is discussed. The ten thousand ton per month capacity facility will handle liquid solids and semi-solid wastes. In-plant measures of reducing the waste water discharge problems in the petroleum refining industry is presented and a variety of examples given. A system for the thermal decomposition of fluidized industrial wastes was developed. It operates at approximately 2,000F and destroys most types of liquid and semi-liquid wastes, virtually elimating both water and air pollution. Several methods of treating oils are discussed and include sedimentation, biological processes, and sand filtration. The development of waste water management programs is described and an example is sited in which the effluent stream from a treatment facility is utilized in ponds which have developed into a bird sanctuary and apparently become an asset to the community. Some data is presented for the biological treatment of combined petrochemical and municipal waste water. An environmental management program undertaken in the planning and development of a major new petrochemical facility is presented. Water conservation waste treatment methods are discussed for a 125,000 bbl per day refinery. Deep-well disposal techniques for the disposal of both liquid and liquid solids wastes streams are presented. Several sources concerned with the biologic oxidation of petroleum wastes are summarized. (Hancuff-Texas)
W71-01857

DEVELOPMENT OF A FLUIDIZED-BED TECHNIQUE FOR THE REGENERATION OF POWDERED ACTIVATED CARBON,
Battelle Memorial Inst., Columbus, Ohio. Columbus Labs.
A. K. Reed, T. L. Tewksbury, and G. R. Smithson, Jr.
Environmental Science and Technology, Vol 4, No 5, p 432-437, May 1970. 4 fig, 5 tab.

Descriptors: *Activated carbon, Adsorption, *Sewage treatment, Waste water treatment, Tertiary, Treatment efficiency, Performance.
Identifiers: *Fluidized-bed, *Regeneration, Variables, Losses, Pulsing.

The study on the regeneration of spent powdered carbon was directed toward the development of a fluidized-bed regeneration technique. Two fluidized-bed systems were considered during the course of the investigation. A system in which the dried spent carbon was regenerated during its passes through a fluidized-bed of an inert material; and a pulsating fluidized bed system in which the finely divided regenerated carbon served as the bed material. A major portion of the experimental study made upon the fluidized inert bed system consisted of an evaluation of the fluidized technique. The major variables examined and ranges studied during the program were as follows: temperature - 500 to 1500F, composition of the fluidizing gas-selected mixtures of nitrogen, oxygen, carbon dioxide and water, bed weight - 0 to 6,720 grams, bed depth - 0 to 11.5 inches, moisture content of feed- 0.5 to 50% water. Data obtained during these experiments are tabulated and compared. In the study of the pulsed fluidized-bed system the pulsations were obtained by simply interrupting the flow of fluidizing gas with frequencies on the order of 400 to 500 pulses per minute. With the fluidized inert bed system regenerated carbon products were obtained which has absorptive capacities of 100% when compared with virgin activated carbon. The weight recoveries were as high as 88%. Similar regeneration also was obtained with the pulse fluidized-bed system. (Hancuff-Texas)

A MASTER PLAN REPORT FOR THE ATLANTIC COUNTY NEW JERSEY PLANNING BOARD, WATER AND SEWER STUDIES.
Atlantic County Planning Board, Atlantic City, N.J.

Available from NTIS as PB-189 718, $3.00 in paper copy, $0.95 in microfiche. Atlantic County Planning Board, October 1969. 60 p folder, 13 tab. HUD Project N.J.-99.
Identifiers: *Urban planning, *New Jersey, *Water supplies, Urban planning, *Sewage, Sanitary engineering, Water pollution, Fire safety, Water resources, Surface waters, Waste water treatment, *Atlantic County (New Jersey), *Area planning and development.

Existing sewerage and water facilities are dealt with and some proposals are made for a future County-wide sewer system. Planning for future water supply is discussed along with the nature and types of pollution and the types of surface water according to the uses for which it is suited. Existing sewerage facilities are indicated in the three regions into which the County is divided. Three alternative comprehensive County sewerage plans are outlined. Existing water supply and fire protection in Atlantic County is described along with planning for future water supply. Four large maps are included showing: surface water quality, existing waste water treatment facilities alternative sewerage facility plans, and existing water supply facilities.
W71-01875

METABOLIC STORAGE OF PHOSPHORUS IN THE ACTIVATED SLUDGE FLOC,
Marquette Univ., Milwaukee, Wisc. Dept. of Civil Engineering.
S. K. Malhotra.
Available from NTIS as PB-195 980, $3.00 in paper copy, $0.95 in microfiche. Wisconsin Univ. Water Resources, Technical Completion Report, July 1970. 80 p, 8 fig, 72 ref. OWRR Project A-015-WIS (1).

Descriptors: *Phosphorus, *Activated sludge, *Calcium, *Iron, *Waste water treatment, Sewage treatment, Flocculation.
Identifiers: *Cations, *Synthetic feed, *Secondary waste treatment, Mixed liquor.

Two laboratory batch aeration units were operated under similar conditions using synthetic feed with and without phosphates. With synthetic feed, the normal activated sludge flocs after being washed off of their cations exhibited a phosphorus storage between 2.5% and 2.9% based on the mixed liquor

volatile suspended solids (MLVSS). The storage of phosphorus was found to be independent of MLSS and organic load levels. The phosphorus starved activated sludge flocs also exhibited identical phosphorus storages. This agrees with the findings of Menar and Jankins (1968) that the biologically incorporated phosphorus in the activated sludge floc varies between 2% and 3% based on the volatile mass of activated sludge. After test runs exhibited practically the same percent phorphorus in the volatile mass, the units were subdivided and fed with the same standard synthetic feed except that different amounts of cations (Ca.... and Fe.....) were added to it to obtain the increase in the percent phosphorus in the cell mass due to the cations in the feed. The percent phosphorus incorporated in the volatile mass was increased from an average of 2.89% to 3.44% with 40 mg/l of Ca.... and from 2.89% to 4.27% with 120 mg/l of Ca.... in the feed. The corresponsing calcium content of the sludge was 3.1% and 5.1% on the volatile mass basis. Similarly 15 mg/l and 30 mg/l of Fe..... in the feed enhanced the percent phosphorus in the volatile mass. (Malhotra-Wisconsin)
W71-01896

WATER QUALITY CONTROL WITH SYNTHETIC POLYMERIC FLOCCULANTS,
Connecticut Univ., Storrs. Inst. of Water Resources.
J. K. Dixon.
Available from NTIS as PB-195 983, $3.00 in paper copy, $0.95 in microfiche. Technical Completion Report, November 1970. 4 p. OWRR Project A-016-CONN (1).

Descriptors: *Flocculation, Filtration, Electrophoresis, Settling, *Algae, *Silica, *Bacteria, Water pollution control, Waste water treatment.
Identifiers: Polyacrylamide, Polyethylenimine.

Studies have been made of the flocculation of silice, algae and bacteria by means of low concentrations of synthetic polymers. The effects of polymer molecular weight and structure have been emphasized, using the silica, and pure cultures of green algae and E. coli under a variety of conditions of pH and colloid concentration. Filtration rate, light transmission and electrophoretic mobility have been employed to measure degree of flocculation. Non-ionic and anionic polymers did not produce flocculation, but cationic polyethyleneimines were effective at concentrations of 0.1 to 100 ppm, the optimum being dependent on pH, colloid concentration and polymer molecular weights above about 2000. Algae required some 30 to 500 times higher solution concentration of polymer than did the bacteria and silica, respectively. Two types of polyethyleneimine polymer tagged with radioactive C14 were prepared which flocculated the three kinds of colloids in the same way as untagged polymers. In the region where flocculation was optimum the concentrations of polymer adsorbed on the colloid surfaces stood in roughly the ratio1:10:200 for silica, E. coli and algae, respectively. Poor flocculation efficiency was not to be associated with low adsorption, but to specific polymer-surface interactions which reduced the efficiency of the adsorbed polymer. The results have been shown to conform with current theories of flocculation of other colloids. They should assist in attaining better water quality control by the use of the synthetic polymers in numerous practical operations. (Dixon-Conn)

FLOCCULATION OF COLLOIDS WITH POLYELECTROLYTES IN AQUEOUS SALT SOLUTIONS,
Rhode Island Univ. Kingston. Dept. of Civil Engineering.
Donald L. Sussman.
Available from NTIS as PB-195 977, $3.00 in paper copy, $0.95 in microfiche. Technical Completion Report, Rhode Island Water Resources Center, October 1970. 14 p. OWRR Project A-024-RI (1).

Descriptors: *Flocculation, Coagulation, *Polyelectrolytes, *Colloids, *Corn starch, *Tannic acid, *Calcium ion, Waste water treatment.
Identifiers: Sodium polystyrene sulfonate, *Chloride, *Refiltration rate, *Turbidity, *Flocs.

The purpose of this research was to observe the behavior of organic colloids in the presence of polymeric flocculants and the ionic salts NaCl, NaClO4)2. The study was defined in terms of the flocculation kinetics and the absolute turbidity. In the flocculations of corn starch, and tannic acid the presence of the calcium ion greatly accelerated the rate of flocculation, and chloride ion had a slight desruptive effect on floc formation. The flocculation studies were confirmed by refiltration rate experiments where the floc sizes were determined. The flocs with calcium ion were the largest and those with chloride the smallest. (Sussman-Rhode Island)

ACTIVATED CARBON RECLAIMS WATER FOR CARPET MILL,
Stephen-Leedon Carpet Co.
William H. Phipps.
Water and Wastes Engineering/Industrial, Vol 7, No 5, p C22-C23, May 1970. 2 fig.

Descriptors: *Activated carbon, *Reuse, *Waste water treatment, Color, Chemicals, Organic matter, Dewatering, Water temperature, Adsorption, *Pennsylvania.
Identifiers: *Carpet mill waste water, Dyes.

To meet pollution control laws, the Hollytex Carpet Mills installed waste water reclamation system in a new plant. The waste water from the dyeing, rinsing, vacuum dewatering process contains lint, dyes, chemicals, organic matter, color, and turbidity. At production capacity, 500,000 gpd is discharged. The reclamation system has an adsorber containing 50,000 lbs. of Filtrasorb (a Calgon Corp. product) granular activated carbon, to achieve 80% recovery of waste water. The activated carbon is a high density, high porosity carbon. Pole structure is carefully controlled to provide effective adsorption of both high and low molecular weight organic impurities. Mesh is 12 x 40 U.S. Std. Prior to the adsorption unit, the waste water passes through two stainless steel lint removal conveyors. The carbon is contained in a plastic-lined, mild steel adsorber, 27 x 9 ft, 9 in. in diameter. The waste water flows upward through the moving bed adsorber. Spent carbon is conveyed in a water slurry to a holding tank from where it is educted to a combination dewatering furnace feed screw. Carbon is reactivated in a multiple-hearth, gas-fired furnace equipped with a wet scrubber for removal of particulates from exhaust gases. Reactivated carbon is discharged from the furnace to a quench tank and then to a pressure vessel from where it is hydraulically transported to a feed tank atop the adsorber. Losses are expected to be about 5%. Purified water flows to a cooling tower where it is cooled to 90LF. from an incoming temperature of 180LF. (Selby-Texas)

THERMOPHILIC ACTIVATED SLUDGE PROCESS,
Mississippi State Univ., State College.
Adnan Shindala, and James E. Parker.
Water and Wastes Engineering, Vol 7, No 3, p 47-49, March 1970. 2 tab, 3 fig, 8 ref.

Descriptors: *Activated sludge, *Thermophilic bacteria, Biochemical oxygen demand, Organic loading, Waste water treatment, Sewage treatment.
Identifiers: *Raw sewage, Solids return.

The ability of thermophilic aerobic microorganisms to provide adequate treatment of a waste by activated sludge process under varying organic loading conditions is discussed. Laboratory data show that at 55 degrees C, with no solids return, the overall BOD reduction was 94% under varying organic loading conditions. Decreasing the detention time has no apparent effect on the BOD reduction efficiency. With a return solids ratio of 1:1, the average BOD reduction efficiency was 85%. A variation of mixed liquor suspended solids concentration from 200 to 650 mg/L had no apparent effect on the removal efficiency. (Selby-Texas)
W71-01967

COLDWATER CREEK WASTE WATER TREATMENT PLANT,
Joseph W. Larson.
Water and Wastes Engineering, Vol 7, No 4, p 44-48, April 1970. 3 tab, 3 fig.

Descriptors: *Waste water treatment, *Treatment facilities, Design, Sewage treatment, Missouri, Activated sludge.
Identifiers: *St. Louis (Mo).

Because of the rapid growth of the Metropolitan St. Louis area and because the Coldwater Creek is substantially dry, the area adjacent to the Coldwater Creek waste water treatment plant and downstream requires the discharge of a high quality effluent. For these reasons, the plant is of the activated sludge-type that provides for the chlorination of the plant effluent and, if necessary, for odor control, the plant influent and digester supernatant as well. Treatment consists of grit removal followed by comminution, primary settling, aeration, final settling, and chlorination before the effluent is discharged into Coldwater Creek. Primary and waste-activated sludge, sometimes thickened, is pumped into digesters. The digested sludge is disposed of in open sludge storage basins. When necessary, digester supernatant can be returned to the raw sewage flow or to the aeration basins in order to increase the solids loading. In addition to the pump and blower building, major structures include the grit basins and comminutors, primary settling tanks, aeration tanks and control building, final clarifiers, sludge thickener, digesters, chlorination facilities, and shope and garage areas. The 40-acre treatment plant complex is situated on a 78-acre tract north of Coldwater Creek and 11 miles north of the center of St. Louis. (Selby-Texas)

SINGLE-STAGE LIME CLARIFICATION OF SECONDARY EFFLUENT,
Robert A. Taft Water Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
E. L. Berg, C. A. Brunner, and R. T. Williams.
Water and Wastes Engineering, Vol 7, No 3, p 42-46. 7 fig, 1 tab, 6 ref.

Descriptors: *Effluents, *Filters, Turbidity, Lime, Water reuse, Reclaimed water, Waste water treatment, Tertiary treatment.
Identifiers: *Clarification, Anthracite filter, Sand filter, Characteristics.

This study was undertaken to produce suitable clarified water from secondary effluent for an advanced waste treatment system which includes granular activated carbon treatment and electrodialysis. The clarifier was operated at various pH values to ascertain also the effects upon those constituents normally present in secondary effluent. Results showed that a lime clarification system can be effective and economical tool for the clarification of relatively hard waste water. Water of high clarity, however, is obtainable only during optimal operation of the biological oxidation process. The system also removed large amounts of phosphate, a major nutrient that supports algae life. The economics of the system are comparable with other forms of clarification. (Selby-Texas)
W71-01969

ADVANCED WASTE TREATMENT IN NASSAU COUNTY, NEW YORK, WATER PROVIDED FOR INJECTION INTO GROUNDWATER AQUIFERS,
Burns and Roe, Inc., Oradell, N.J.
John L. Rose.

Water and Waste Engineering, Vol 7, No 2, p 38-39, February 1970. 2 fig, 3 tab.

Descriptors: *Waste water treatment, *Tertiary treatment, *Water reuse, Aquifers, Activated sludge, Coagulants, Injection wells, Observation wells, Costs, New York.
Identifiers: *New York, *Hydraulic barrier, Backwash, Nassau County (N.Y.).

To meet a threat of salt water intruding into its aquifers, Nassau County, New York, considered a proposal which would allow an increase of the permissible withdrawals, to create a hydraulic barrier in the aquifer, which would prevent both the natural outflow, now lost to the sea, and the intrusion of salt water. The barrier would be formed by injecting treated waste water through a series of recharge wells. For evaluation purposes, a 400 gpm demonstration plant was constructed. The plant provides tertiary treatment for the effluent of the conventional activated sludge plant. The product water is pumped about one-half mile to a test injection site. The tertiary treatment plant is a conventional water treatment plant modified to utilize secondary effluent as a water source. Effluent is pumped into a clarifier to which alum and coagulant aids are added. The supernatant flows by gravity to two mixed media filters operated in parallel. Final backwash is semi-automatic and includes air scour, surface wash, and high-and low-rate backwashing. Filter effluent is pumped through four granular activated carbon adsorbers. The renovated water is disinfected with chlorine before being pumped to the injection site. The injection facilities consist of a storage tank, a degasifier for removal of dissolved gases, injection and redevelopment pumps, an injection well, and 12 observation wells. The injection well is 36 inches in diameter by 500 feet deep and contains an observation well and geophysical probes. Costs are tabulated. Operation of the tertiary treatment plant and injection system since January 1968, confirms the concept of recharging waste waters into the aquifer. The well has been redeveloped after each series of injection tests with negligible loss of capacity. The treatment plant has consistently produced water meeting the injection quality criteria. (Selby-Texas)
W71-01970

DEEP-BED FILTER SYSTEM FOR MILL SCALE REMOVAL,
Dravo Corp., Pittsburgh, Pa. Dept. of Water and Waste Treatment.
Donald F. Heaney.
Water and Wastes Engineering/Industrial, Vol 7, No 3, p B6-B7, March 1970. 3 fig, 1 tab.

Descriptors: *Filtration, *Industrial wastes, Scaling scour, Lake Michigan, Coagulation, Waste water treatment.
Identifiers: *Deep-bed filters, Backwashing.

The Youngstown Sheet and Tube Company added a new 84-inch hot strip mill to its Indiana harbor works in the hope of minimizing the discharge of mill scale and other pollutants into Lake Michigan. The 60,000 gpm treatment facility has 42 deep-bed filters providing 8,900 sq. ft. of filter area. Backwash air is used at a rate of 2,600 cfm when washing two filter tanks. Valves controlling backwash water flow are operated from their own instrument air system. One section of 7 dual filters is backwashed on each shift, with each dual unit requiring 30 minutes for complete washing. The pressure build-up varies between 15 and 25 feet water gauge. If the pressure build-up exceeds a preset figure of approximately 30 feet water gauge, the filters go automatically into backwash in turn. This continues until all filter units have been cleaned. The backwash water is returned to the influent end of the scale pits. Operating experience has proved that addition of a coagulating polymer is not always necessary. The scouring air required in backwash is distributed by a lateral pipe system and is controlled by the 'M' block units. Individual domes in the blocks ensure uniform distribution through the sand during backwash. Backwash water is taken from the filtrate header. The filtrate is emptied into the lake through a continuous monitoring system. Not only did the deep-bed filter system offer substantial savings in space and economics of operation, but results for 18 months of operation have been highly satisfactory. The water coming from the two-scale basins averages 20 to 70 mg/L oil and 70 to 110 mg/L solids. The effluent from the filter averages 3 to 5 mg/L oil and 3 to 5 mg/L solids-about equivalent to the quality of the water taken from the lake. (Selby-Texas)
W71-01971

A TREATMENT PROCESS FOR STRONG CANNERY WASTES,
Oklahoma Univ., Norman. Coll. of Engineering.
George W. Reid, and Leale Streebin.
Water and Wastes Engineering/Industrial Vol 7, No 3, p B1-B5, March 1970. 5 fig, 4 tab, 8 ref.

Descriptors: *Canneries, *Industrial wastes, Design, Treatment facilities, Biological oxygen demand, Waste water treatment.
Identifiers: *Potato wastes.

A small community sewage treatment plant could not accept the high-volume, strong organic wastes of a cannery. After a study was completed, it was recommended that the combined raw waste stream be separated from the municipal waste and routed through a separate treatment system. This system will consist of screens to remove large pieces of waste product, which will be trucked to an existing landfill. The screened waste will flow first to a high-rate minimal-solids aeration basin, designed to remove 50% of the soluble BOD, and then to two low-rate, extended aeration basins for polishing, followed by final clarification. Nutrients will be fed prior to the minimal solids unit to balance the waste for optimal organic removals. Sludge return to the front of all aeration tanks will be provided to maintain a recirculation ratio of approximately 1 to 1. (Selby-Texas)
W71-01972

TREATMENT PLANT DESIGNED FOR FROZEN MEAT WASTES,
Bissell, Merrill and Associates, Williamsville, N.Y.
William H. Merrill, Jr.
Water and Wastes Engineering Vol 7, No 5, p C5, May 1970. 1 fig.

Descriptors: *Design, *Industrial wastes, Lake Erie, Biochemical oxygen demand, Waste water treatment, Aerobic conditions, Aerobic treatment, Flocculation, New York.
Identifiers: *Food processing wastes, Packaging plants, Buffalo (New York).

A packaged frozen meat products plant was established outside Buffalo, New York, where there were no sewers and none planned. Design flows of the plant were 100,000 gpd. In setting up a waste water treatment facility, data from another plant was considered. The pH intensity level of the wastes indicated a biological treatment would be favorable and a nutrionally balanced system would result. However, the high ether solubel content would seriously affect a biological system by imparing the oxygen transfer efficiency of applied air. Therefore a system for removing the ether solubles would have to precede the biological system. This would also affect some BOD removal. Initial treatment of the waters is in an air flotation cell, where grease and fats along with most of the suspended solids are removed. After completion of the flotation process and before entering the aeration unit, the subnatant is mixed with the domestic waste from the inplant population. The combined waste entering the aeration tank is aerated and detained for about 24 hours. During this time, air is continuously mixed with the waste water by means of a surface aerator. From the aeration tank the water is clarified for 4.5 hours. Water leaving the clarifier is chlorinated and discharged through a measurement flume into Lake Erie. The lengthy outfall line acts as a chlorine contact tank. The overall BOD removal efficiency averages 85 to 90% at present and is expected to increase as the plant's experience grows. (Selby-Texas)
W71-01973

PLANNING OF MUNICIPAL WASTE WATER RENOVATION PROJECTS,
Bechtel Corp., San Francisco, Calif. Scientific Development Dept.
J. W. Porter.
Journal of the American Water Works Association, Vol 62, p 543-548, September 1970. 2 tab, 3 fig, 6 ref.

Descriptors: *Waste water treatment, *Municipal water, Planning, Attitudes, Economics, Water reuse, Reclaimed water.
Identifiers: *Public acceptance, Waste water renovation.

The planning of municipal waste water renovation projects will be increasingly important in the water resources field. This is primarily true because of the benefits of water supply and pollution control of such projects. In order to systematically develop such projects it will be necessary to consider economic, technical, institutional, and public acceptance aspects. The basic economic considerations revolve around water pollution control/water supply functions of a water renovation facility, and these same functions in separate, more 'conventional' facilities. The technical considerations are, to a large extent, a function of the planned use of the product water and has aspects of process selection and water quality criteria, reliability, public health considerations, and pilot/demonstration work. A basic operational change occurs when the 'renovation/reuse' concept is substituted for the 'treatment/discharge' concept. The public acceptance of renovated waste water must be carefully considered; and suggested guidelines in planning for public acceptance are: (1) sampling of attitudes, (2) informing local press and civic organizations, (3) keeping public health agencies fully informed, (4) potential users such as industry should be brought into planning early, and (5) water conservation, pollution control and possible economic benefits should be stressed in public announcements. The relative importance of all these aspects of planning for waste water renovation projects will depend on such items as the type of water use envisioned, the project location and the entities involved. (Selby-Texas)
W71-01974

A STUDY OF MEAT PACKING AND RENDERING WASTES,
Wayne State Univ., Detroit, Mich.
Henry A. Dirasian.
Water and Wastes Engineering/Industrial Vol 7, No 5, p C16-C20. 2 fig, 2 tab, 2 ref.

Descriptors: *Industrial wastes, *Sewage treatment, Sewage disposal, Waste water treatment, Michigan.
Identifiers: *Food processing, Wastes, Grease removal, Detroit (Michigan).

A meat packing and rendering firm was informed by the City of Detroit that its effluent did not fall within the city sewer use ordinance as it related to grease content. A study was made to suggest needed action to reduce the amount of grease entering the sewer. The first part of the study indicated the substantial amount of pretreatment of waste water was required if the regulations were to be met. A second step of the study was the construction of a laboratory scale pressure flotation unit. The unit consists of a pressurized chamber in which either plain water of plant effluent is put under pressure and released to the flotation column in which the waste is held. The results of the limited study showed that: pressure flotation, assisted by an acceptable flotation aid (alum in this case), would remove the greater portion of the grease produced in a meat packing and rendering plant; in this study a recirculation ratio of 4 to 1 was maintained and a flotation period of 20 minutes was standard-this 20

minute retention period is somewhat less than the 30 to 60 minute usually provided and will allow the laboratory studies to be extrapolated to a field unit; and the required alum concentration varies lineraly with the amount of SS in the influent in the ranges explored in this study. (Selby-Texas)

NOVEL BIOLOGICAL TREATMENT PROCESS UTILIZED UNIQUE REDWOOD MEDIA,
Cornell, Howland, Hayes and Merryfield, Corvallis, Oreg.
Frank D. Schaunberg, and Sidney Lasswell.
Water and Wastes Engineering Vol 7, No 8, p 34-37, August 1970. 3 fig, 1 tab.

Descriptors: *Activated sludge, *Biological treatment, *Trickling filters, Slime, Void ratio, Biological oxygen demand, Waste water treatment, Oregon.
Identifiers: *Redwood, Support media.

A pilot plant investigation was undertaken during 1969 to evaluate the potential of redwood slats as a biological support media. The process, called Activated Biofilter, is a novel biological treatment designed to combine the desirable features of the fundamental trickling filter and activated sludge processes by circulating a mixed liquor of secondary sludge and filter underflow through a redwood slat biological support media. This lightweight media (10.3 lb/cu ft.) is relatively inexpensive, and appears very durable. The rough-sawn texture of redwood slats facilitates the retention of biological slime. Redwood media has about double the void percentage and void space to surface area ratio found for a comparable volume of 4 inch diameter rock media. The specific surface of redwood media (14 sq ft/cu ft) is slightly greater than that of 4 in. rock. The investigation took place at the Corvallis, Oregon, municipal sewage treatment plant. Findings of the study concluded that the Activated Biofilter process can be expected to produce a high-quality effluent in terms of BOD at loadings of up to 200 lb. BOD per day per 1000 cu ft and with MLSS of 3000 to 6000 mg/L. Shock organic loads and wastes containing significant quantities of carbohydrates can apparently be treated by the ABF process without a severe reduction in treatment efficiency. The activated biofilter system appears to combine the most desired characteristics of the trickling filter and activated sludge processes. Future studies will help determine optimum conditions of media depth, underflow recycle ratio and hydraulic application rates. (Selby-Texas)

CANNING (LITERATURE REVIEW),
G. A. Richter, and M. R. Soderquist.
Journal Water Pollution Control Federation, Vol 42, No 6, p 1165-1171, June 1970. 41 ref.

Descriptors: *Canneries, *Aerobic treatment, *Anaerobic digestion, *Industrial waste, *Waste water treatment, *Organic waste, Activated sludge, Trickling filters, Irrigation systems, Neutralization, Adsorption, Industrial wastes.
Identifiers: *Canning waste treatment, Screening, Food processing.

Both activated sludge process and anaerobic digestion using an anaerobic filter were discussed. Mechanical potato peelers, protein recovery and a dry caustic peeling process are also described. Detailed characteristics of citrus waste and descriptions of various treatment methods and their application to citrus waste water treatment were the subject of several reports. Other reports discussed the results of spray irrigation of food processing waste on fields of fruits and vegetables. The process is suitable for irrigation of crops despite the fact that wastes from fruit and vegetable processing plants are quite variable in chemical composition, depending on the type of crop being processed. Research project results of air flotation, vibratory screening trickling filtration, neutralization, activated carbon adsorption, aerated lagoons, activated sludge systems and high-rate plastic media trickling filters employing forced aeration were reported for treatment of various canning waste. A discussion of several waste disposal systems was presented and several reports gave cost efficiency relationships for (a) land area requirements, (b) capital cost, and (c) operating and maintainance cost for several alternative unit processed for canning-waste treatment. LIBERTY, S.C. TEXTILE FINISHING WASTE,
South Carolina Pollution Control Authority, Columbia.
G. A. Rhame.
Water and Wastes Engineering/Industrial Vol 7, No 5, p C6, May 1970. 3 tab.

Descriptors: *Aeration, *Design, Textiles, Lagoons, BOD, Sludge disposal.
Identifiers: *Textile wastes, South Carolina.

The ability of extended aeration systems to handle alkali textile wastes has been demonstrated successfully in Liberty, S.C. Biological utilization of the starches and other carbohydrates in cotton finishing mill wastes produces ample carbon dioxide to neutralize the alkali to a satisfactory degree. The flow pattern of the extended aeration system is straight through with a sludge recirculation at 250 gpm. No sludge disposal equipment is necessary because suspended solids are low and can be handled by tank truck. Waste volume has averaged 0.5 mgd, of which 30,000 gpd is sanitary waste. BOD removal is very high. No odors have been observed from nearby houses or the small receiving creek. There has been no need to waste sludge. Sludge settling rate is high. Performance of this plant illustrates the excellent results obtainable when the designer is generous with applied housepower. It is expected that effluent BOD will remain less than 20 mg/l at the design load of 1.0 mgd. Aeration parameters, equipment inventory, and analytical data are tabulated. (Selby-Texas)

WASTE WATER RECLAMATION AND REUSE,
Envirotech Corp., Palo Alto, Calif.
F. P. Sebastian.
Water and Wastes Engineering Vol 7, No 7, p 46-47, July 1970. 1 fig, 1 tab, 12 ref.

Descriptors: *Waste water treatment, *Reuse, *Tertiary treatment, California, Costs.
Identifiers: *Public acceptance.

In March 1968 the South Tahoe (Calif.) Water Reclamation Plant, the first, largest and most fully integrated plant in the world today producing water of potable quality directly from sewage effluent, began operation and has since processed one billion gallons of waste water, enough drinking water quality effluent for the annual household needs of 30,000 people. The incremental cost of discharging secondary effluent is $.166 per 1000 gallons. The stated operational cost includes carbon adsorption and regeneration at $.036 per 1000 gallons. Public resistance to the use of renovated water is lessening. Use of this type of water in long distance space flights will help increase public acceptance. According to the U. S. Public Health Service, drinking water standards do not apply to direct use of reclaimed water for drinking. Research is reportedly planned to establish the needed standards for water from heavily polluted sources. The potential benefits of purified waste water are greater than the incremental costs. The value of secondary effluent is generally nil, whereas tertiary effluent ranges in value from $.09 per 1000 gallons to the cost value of fresh water, on San Francisco peninsula, of $.18 to $.376 per 1000 gallons. The virtual elimination of biostimulants and elimination of the need for ocean outfalls with unknown effects on bay and ocean ecology can be accomplished with tertiary treatment. A simplified flowsheet of South Tahoe Water Reclamation Plant is included in the article. (Selby-Texas)

CURRENT STATUS OF RESEARCH ON WASTE WATER RECLAMATION IN SOUTH AFRICA,
G. J. Stander, L. R. J. Van Vuuren, and G. L. Dalton.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, March 16-20, 1970. 12 p, 3 tab, 7 fig, 8 ref.

Descriptors: Activated carbon, Coagulation, Research and development, *Waste water treatment, *Water reuse, *Reclaimed water.
Identifiers: *South Africa, Dissolved organics, Design formulation.

The efficient removal of the predominately organic impurities from waste water calls for the application of more sophisticated techniques than are normally applied in conventional water treatment. The successful operation of large-scale plants at Windhoek and Lake Tahoe have confirmed that a combination of biological, chemical and physical processes may be considered as most feasible current approach in waste water reclamation. Research conducted by the National Institute of Water Research has been focused on further refinements to some individual process units. A pilot plant was constructed in Pretoria to study the physico-chemical route for waste water reclamation. These investigations have culminated in the design and construction of a 1 million gal/day demonstration plant which will be a basis for further research on waste water reclamation in South Africa, with the main objectives of formulating design criteria for larger reclamation plants and to evaluate costs and performance data. Particular emphasis is placed on the technique developed for the application of powdered activated carbon as an integral part of the renovation process for the adsorption of dissolved organics from secondary effluents. (Selby-Texas)

THE APPRAISAL OF SOME SIGNIFICANT PROBLEMS IN THE REUSE OF WASTE WATER,
M. R. Henzen, and J. W. Funke.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, March 16-20, 1970. 19 p, 10 tab, 1 fig, 9 ref.

Descriptors: *Reuse, Water requirements, Dissolved solids, Water quality, Salinity, Irrigation, Recreation demand, Cooling water, Corrosion control, *Waste water treatment.
Identifiers: *South Africa, *Effluent composition, Quality requirements.

Of the total water utilized in the Republic of South Africa, about 80% is used for irrigation and stockwatering. The remaining 20%, utilized for domestic and industrial purposes, can be tapped for reclamation. A discussion of availability of waste water for reuse is presented. The quality of waste waters vary considerable depending on origin of the waters, the extent to which it has already been reused, and the degree of dilution. Several tables demonstrate the variations in quality of waste waters, including (1) increase in mineral and organic pollution of water after one cycle of use for domestic purposes, (2) typical compositions of untreated industrial effluents, (3) composition of treated municipal sewage effluents, and (4) total dissolved solids concentration. Waste water may be reused as water supply for domestic purposes, water supply for industries, as irrigation water and for recreational purposes. The relation between water quality and requirements is also discussed. From a point of view of reuse of water, there is no reason why water of highest quality should be used for cooling purposes, since concentrations of 4,000 mg/L of dissolved solids and higher can be tolerated in evaporative recirculating systems. The use of purified sewage water for irrigation has been practiced for many years without apparent deleterious effect to crops and soil. However, municipal or industrial effluents have limiting factors. Because of the wide tolerance limits of water quality for

recreational purposes the reuse of waste waters for this purpose are subject to only a few limitations. From available statistics, there appears to be much scope for a broader application of waste water reuse. (Selby-Texas)

ADVANCED TREATMENT OF MUNICIPAL WASTE WATERS IN THE UNITED STATES OF AMERICA,
Robert A. Taft Water Research Center, Cincinnati, Ohio.
F. M. Middleton.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 33 p, 7 tab, 3 fig, 11 ref.

Descriptors: *Water pollution control, *Waste water treatment, Legislation, Filtration, Screens, Biochemical oxygen demand, Chlorine, Mathematical models, Optimization, Water reuse.
Identifiers: *United States, Tube settlers, Carbon removal.

Water quality standards and the implementation of water pollution control measures in the United States make it necessary to improve on municipal waste water treatment. In addition to better removal of solids sand biodegradable carbon, high removals of phosphorus and nitrogen are being required. Legislation since 1965 and the substantial funds commited to research and building treatment plants indicates the U. S. is on a positive action cause to abate pollution from treatable sources. Better solids removal can be achieved by new filtration techniques, tube settlers, screening and use of chemicals. Better BOD removal is achievable through use of pure oxygen in place of air in activated sludge plants and dissolved organics are efficiently removed by activated carbon. Ozone and light-catalyzed chlorine may be useful ways to destroy organics. Chemical treatment of raw sewage or primary effluents followed by activated carbon treatment may be an alternate to conventional secondary treatment. A variety of phosphorus removal techniques based on chemical precipitation are available. Nitrogen removal methods are not yet available on a well-tested, large scale. Mathematical models and optimization techniques being developed will provide new useful tools for plant design. (Selby-Texas)

MARINE EFFLUENTS RESEARCH AND MARINE DISPOSAL OF EFFLUENTS,
G. R. Atkins.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 15 p, 3 fig, 6 tab, 3 ref.

Descriptors: *Effluents, *Disposal, *Oceanography, Testing, Thermal stratification, Salinity, Ocean currents, Diffusion, Bacteria, Degradation, Coliform.
Identifiers: *South Africa, Eddy diffusion coefficient.

South African coastal authorities became concerned over disposal of effluent in a popular resort beach area of False Bay. An investigation was carried out to determine effects of effluents disposal there. Oceanographic data obtained from the area were: (1) temperature determined by bathythermograph, (2) salinity by the inductive salinometer at zero and 100 feet depths, (3) wind records from coastal installations, and (4) currents measured by dye-bombs. Diffusion tests were conducted to establish the eddy diffusion coefficient. Coliform counts were also taken. Results of all tests concluded the False Bay area was not suitable for discharge of large quantities colored, toxic wastes or raw sewage. This is because major effluent discharge would be dependent on a continual renewal of water masses. This renewal only takes place, some degree during the summer. Temperature records indicate that the water masses during summer are very stable due to density layering. Winter isotherms show significant distortion with almost zero temperature gradients, i.e., potentially unstable conditions. Current movement in the bay is slow. Due to the shallow depth water, dilution coefficients were low. With regard to conditions close inshore, deep water and reasonable current speeds were encountered only on the rocky coastlines. Discharge into small bays must be avoided due to eddy formation or sanitation. (Selby-Texas)
W71-01983

CONSIDERATIONS ON THE DESIGN OF A SEWAGE PURIFICATION PLANT TO PRODUCE AN EFFLUENT SUITABLE FOR ADVANCED PURIFICATION,
W. M. Malan.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 8 p, 1 fig.

Descriptors: *Sewage treatment, *Design, Screens, Sedimentation, Activated sludge, Aeration, Color, Costs, Flow rates, Waste water treatment, Water reuse.
Identifiers: *South Africa, *Sedimentation tanks, Sand filtration.

It was decided by a South African community to abandon a pond system in favor of a conventional sewage purification plant. A large portion of effluent was intended for reuse by a paper mill and other industries which might move in later. An activated sludge plant was selected. Design considerations included, screening and grit removal, primary sedimentation, activated sludge treatment and aeration, secondary settling and activated sludge return. The two primary sedimentation tanks were 50 feet in diameter and provide an upflow velocity of 3.3 feet per hour. Rate of nitrification for the activated sludge treatment was found to be approximately 50 mg/l per hour. Three aeration modules, each capable of treating 0.67 million gallons of settled sewage per day were built. Each module consisted of 4 concentric orbal channels, with two final settling tanks in the middle. Aeration was provided by Huisman discs driven by electric motors. Each aeration module was provided with two secondary settling tanks each 40 feet in diameter. This provides an upflow velocity of 1.8 feet per hour. Two sand filter units each 10 feet by 12 feet were provided. At an initial filtration rate of 2 gallons per square foot per minute, these filters are capable of treating the effluent from one module (.67 million gallons per day). Backwashing can take place at a rate of 12 gallons per square foot per minute. Biologically purified sewage at the community contains normally 90 to 100 color units on the Hazen scale. Present requirements of the paper mill dictate a maximum of 40 units. It was decided to decolorize by means of chlorination and if necessary to supplement this later by flocculation. Costs of establishing and operating the plant are discussed. (Selby-Texas)

EFFLUENT MANAGEMENT BY JUDICIOUS INTEGRATION OF VARIOUS PROCESSES AND UTILIZATION OF TREATMENT PLANT BEYOND DESIGN CAPACITY,
H. C. Blersch, and H. A. De Villiers.
Preprint, 1970 Conference of the Institute of Water Pollution Control (Southern African Branch), Cape Town, South Africa, 16-20 March 1970. 17 p, 1 tab, 17 fig, 2 ref.

Descriptors: *Waste management, *Costs, *Design, Biological treatment, Sedimentation, Flow rates, Biochemical oxygen demand, Waste water treatment, Industrial wastes.
Identifiers: *Distillery wastes, *South Africa, Design capacity, Biological filtration.

Because capital investment in waste treatment facilities is generally governed by peak loads, high, short duration seasonal peaks tend to lead to disproportionate treatment costs. Insufficient specific data on the size and responsiveness to treatment of the peak load result in conservative design criteria which increase this tendency. Described is how costs were substantially reduced in a specific case by establishing design criteria for determining, through several years' experimental operation of full scale units on proportions of the wastes received, added to domestic sewage, (1) the effects of various degrees of seasonal overload, up to very high levels, on biological filtration plant, and (2) the capacity of a large pond area to buffer the effects of consequent seasonal deterioration in plant effluent. Brief reference is also made to the application of the fact that domestic sludge digesters can accept limited admixture wastes while handling their full domestic load. (Selby-Texas)

FLUIDIZED BED RECOVERS PROCESS CHEMICALS,
Chicago Co., Ill.
J. E. Hanaway, Jr.
Water and Wastes Engineering/Industrial Journal, Vol 7, No 5, p C14-C15, May 1970. 1 fig.

Descriptors: *Pulp wastes, *Waste treatment, Biochemical oxygen demand, Ohio River, Inorganic compounds, Oxidation.
Identifiers: *Waste liquor, Paper wastes, Container-Copeland Process.

The Wescor Corporation pulp and paper mill in Kentucky produces about 200 tons of wood pulp per day. The volume of weak waste liquor amounts to about 800 tons per day at a total solids concentration of about 10%, and contains about 36 tons per day of BOD. Treatment in the recovery system destroys more than 99% of the BOD and recovers more than 95% of the inorganic pulping chemicals. The Container-Copeland Process for the treatment is based on high temperature oxidation of the organic matter found in the waste liquor. Because of thermal characteristics of fluidized bed oxidation and the design features in the system, the oxidation is self-supporting, in that it operates on the fuel values contained in the waste liquor at relatively low solids, as compared to other types of oxidation furnaces which require liquor concentrated to 50 or 60% solids. Fluidized-bed oxidation under these conditions presents no explosive hazards. The process steps are described in detail. The on-stream factor of the system at the Wescor mill has averaged about 95% since the start-up in June 1967. (Selby-Texas)

MANAGEMENT OF FARM ANIMAL WASTES.
American Society of Agricultural Engineers, St. Joseph, Mich.

For sale by the American Society of Agricultural Engineers, St. Joseph, Mich. Price: $5.00. Proceedings National Symposium on Animal Waste Management, May 1966, 161 p. Michigan State University, ASAE Publication No. SP-0366.

Descriptors: *Farm wastes, *Management, *Public health, *Water pollution sources, *Livestock, *Waste disposal, *Slurries, *Lagoons, *Biological treatment, Waste storage, Physical properties, Odor, Distribution systems, Irrigation, Labor, Environmental sanitation, Sludge treatment, Incineration, Feeds.
Identifiers: Feedlot runoff, Production, High density systems, Handling, Slatted floors, Materials, Handling, Liquid manure, Equipment design, Waste management, Oxidation ditches, Composting, Kjeldahl nitrogen, Coprophagy.

The National Symposium on Animal Waste Management had three main objectives: (1) To delineate the problem of managing animal waste, (2) To evaluate our current technology in the management of our farm wastes (technology in the farm waste management was divided into methods

of handling, treatment, utilization, and disposal) and (3) To stimulate and give new direction to future research in solid wastes management. Fifty-one papers were presented representing eighty-nine professionals - from industry, campus and government; from manufacturing, research, extension and regulatory agencies; as animal scientists, bacteriologists, economists, engineers, and sanitarians. The last three pages of the publication are devoted to ASAE recommendation (ASAE R292): Uniform Terminology for Rural Waste Management. (See also W71-01993 thru W71-02033). (Christenbury-Iowa State)

PHYSICAL, CHEMICAL AND BACTERIOLOGICAL PROPERTIES OF FARM WASTES (BOVINE ANIMALS),
Michigan State Univ., East Lansing.
S. A. Witzel, E. McCoy, L. B. Polkowski, O. J. Attoe, and M. S. Nichols.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No. SP-0366, p 10-14, May 1966. 10 tab, 19 ref. USDI No. 8 RO1 SW 00042-02.

Descriptors: *Farm waste, *Waste disposal, *Cattle, *Biochemical oxygen demand, Chemical oxygen demand, Anaerobic conditions, Aerobic conditions, Hydrogen ion concentration.
Identifiers: *Lagoon flora, *Population equivalents, *Liquid manure, Liquid manure tank, Volitile solids, Plant response.

This report characterizes pollutants derived from farm animal (Bovine) waste. Wastes were collected from dairy bulls, dairy cows, and beef cattle. The wastes were analyzed for volume, suspended solids, percent BOD and COD. Further analysis show the effects of treating manure on yield and recovery of N, P, and K by corn plants. The data indicate that high concentrations of bacteria (dead or alive), volatile solids, BOD and COD are found in waste from bovine animals. The study indicated that reduction by lagoon retention, settling, aerobic or anaerobic digestion does not remove sufficient amounts of volatile solids, BOD and COD to provide safe effluent for disposal in streams. Indications are that liquid manure handling by farmers may be the most feasible approach for waste disposal. (See also W71-01992). (Christenbury-Iowa State)

BIOLOGICAL INTERRELATIONSHIPS BETWEEN FECES AND FLIES,
California Univ., Berkeley.
John R. Anderson.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No. SP-0366, Michigan State University, May 1966, p 20-23. 35 ref.

Descriptors: *Farm wastes, *Domestic wastes, Confinement pens, Livestock.
Identifiers: *Filth flies, *Livestock-husbandry operations, *Fly populations, Livestock production methods, High-density confinement.

This report discusses the effects on fly populations as affected by changes in livestock production methods. Field research has indicated that the foremost cause for the prodigious number of flies today is the recent widespread occurence of low-area, high-density concentrations of animals in all phases of livestock-husbandry operations. Although recent changes in livestock husbandry have created serious fly problems, the possibilities for constructively managing manure to avoid or reduce the production of flies under today's low-area, high-density confinement of animals appear much better than with previous technologies. SLOPING FLOORS FOR BEEF-CATTLE FEEDLOTS,
California Univ., Davis.
S. R. Morrison, V. E. Mendel, and T. E. Bond.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 41-43. 3 tab, 4 fig, 3 ref.

Descriptors: *Cattle, *Farm wastes, Confinement pens, Performance, Disposal.
Identifiers: *Slatted floor, *Sloping floor, *Feedlots, Weight gains, Cattle behavior, Feed efficiency.

Limited tests on sloping floors for cattle feedlots indicate that slopes up to 7 deg do not depress weight gains or feed efficiency. A slope of about 5 deg is sufficient for removal of most of the manure, but unless some flushing arrangement is employed, manure will build up near the feed bunk. Stalls have little value in preventing this build-up. A slat-covered pit at the lower end of the slope allows manure to move freely off the floor and serves as a satisfactory storage. (See also W71-01992). (Christenbury-Iowa State)

MATERIALS HANDLING AND LABOR IN FREE-STALL AND LOOSE HOUSING,
Purdue Univ., Lafayette, Ind.
W. E. Schmisseur, C. M. Brown, Jr., J. L. Albright, W. M. Dillon, and A. C. Dale.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 43-45. 3 tab, 17 ref.

Descriptors: *Farm wastes, *Cattle, Disposal, Labor.
Identifiers: *Materials handling, *Free-stall, *Loose housing, Bedding.

In the winter and spring of 1964-65 Purdue University conducted two 6-month studies in Lafayette and Cuzco, Indiana, comparing free-stall to loose housing. For one free-stall comparison, 20 stalls were place in one-third of the area of each of two pole-type barns. The remaining areas were used for loose housing. Ninety cows were divided into four individual lots. Each free-stall unit housed 20 cows, with 25 cows in loose housing. All four lots were treated and handled similarly. Straw was used as bedding. Daily work sheets showing time used to bed the cows, scrape alleys, pounds of bedding used, and the pounds of manure removed daily were kept on all groups. Two pole-type barns were also used in the other free-stall comparison. One barn was used for loose housing; the other contained 32 free stalls; 26 animals were housed in each barn. Sawdust was used to bed all animals for half of the experiment; straw was used for the rest of the experiment. (See also W71-01992). (Christenbury-Iowa State)

MACERATION FOR DISPOSAL OF DEAD POULTRY,
California Univ., Davis. Dept. of Agricultural Engineering.
J. A. Moore, and W. C. Fairbank.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 47-49. 2 fig, 2 ref.

Descriptors: *Farm wastes, Disposal, Farm lagoons, Septic tanks, *Waste disposal, *Poultry, Equipment slurries.
Identifiers: *Macerator, Composting, Thin bed drying, *Equipment design.

The development of a macerator for dead poultry is reported. Several initial designs were investigated. Combining all the findings of the preliminary investigation in the final design of the second chopper-type macerator has led to the development of a satisfactory dead-bird macerator. Systems for disposal of the macerated poultry are discussed and evaluated. Slurry systems, lagoons, heated septic tanks, artificial composting, and thin bed drying were judged to be satisfactory for disposing fo the macerated poultry. (See also W71-01992). WATER METABOLISM STUDIES MAY ASSIST WITH WASTE DISPOSAL,
Texas A and M Univ., College Station. Dept. of Poultry Science.
J. H. Quisenberry, D. D. Malik, and Ramon Ibarbia.

Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 49-51. 10 tab.

Descriptors: *Farm wastes, *Poultry, Waste disposal, Odor, Clays, Bentonite, Genetics, Confinement pens, Eggs diets.
Identifiers: Waste management, Water excretion, Drippings, Laying bird.

For many poultry operations, attempts to solve the waste-management problems can best be accomplished by concentrating on methods of obtaining dry or drying the droppings to a manageable level. Three methods have been tested and were reported in this paper. These are: (a) use of splashboards under cage operations, (b) genetic selection for low water excretors. Each of these has its appropriate place in bird management and should be used by poultrymen as their specific needs require. (See also W71-01992). (Christenbury-Iowa State)

DISPOSAL OF POULTRY MANURE BY PLOW-FURROW-COVER METHOD,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Agricultural Engineering.
Charles H. Reed.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 52-53. 1 tab, 4 ref.

Descriptors: *Farm wastes, *Poultry, *Waste disposal, Odor, Slurries, Furrows, Soil disposal fields.
Identifiers: *Waste management, *Plow cover, Liquid manure, Flies.

The disposal of liquid manure by the plow-furrow-cover technique appears to be an excellent conservation method. The upper soil layer is used as the disposal medium; there is no opportunity for flies to breed or even feed. In a closed handling system there are no detectable odors. With this method from 1 to 2 in. of slurry is deposited in a plowed furrow 6 to 8 in. deep. Immediately after deposition, a single-bottom plow covers the manure, making the next furrow; this can be done in one or two operations. Depositing and completely covering 2 in. of slurry, equivalent to 225 tons per acre, has been very successful. This paper describes the development of the method, the initial disposal programs, and the proposed experimental program to determine the maximum rate of disposal on a limited land area. (See also W71-01992). (Christenbury-Iowa State)

Descriptors: *Farm wastes, *Septic tanks, *Sewage disposal, *Conductivity, Soil disposal fields, Sewers, Construction, Absorption, Rural areas.
Identifiers: *Soil absorption, *Soil clogging, Household wastes.

Generally the most satisfactory method of disposing of human excreta and household wastes in rural areas is the septic tank soil sbsorption system. While studies show that this is a safe system of household wastes disposal, many systems are malfunctioning; a high percentage of these failures is due to soil absorption difficulties. Thus the utility of the system depends on the size of the absorption field, the waste load, soil conditions, and the construction and installation of the absorption field. This paper discussed the criteria that should be used when designing a septic-tank system. The factors affecting the satisfactory operation of the system are presented. Construction and installation practices are examined. Conditions affecting soil clogging are presented along with conductivity vs cumulative outflow graphs. (See also W71-01992). REQUIREMENTS FOR MICROBIAL REDUCTION OF FARM ANIMAL WASTES,
South Dakota State Univ., Brookings. Dept. of Bacteriology.
Edward C. Berry.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 56-58. 2 tab, 1 fig, 13 ref.

Descriptors: *Farm wastes, *Lagoons, *Biodegradation, *Sewage bacteria, Odor, Anaerobic conditions, Aerobic conditions, E. coli, Bacteria, Fungi, Actinomycetes, Protozoa, Algae.
Identifiers: *Chemical environment, *Physical environment, Phage, Fermentor, Facultative, Microaerophilic, Inoculation.

The cardinal principle on which all sanitation reduction work is based is to provide an environment in which the micro-organisms can bring about conversion of undesirable material to a non-offensive and stable state in the shortest possible time. To bring this about it is necessary to consider (a) the wastes we want reduced and their end products and (b) the organisms that we want to perform this chore for us. The micro-organisms involved in manure reduction are to be found in the following groups: (a) bacteria (aerobic, anaerobic, microaerophilic, facultative or obligate), (b) fungi, (c) actinomycete, (d) protozoa, (e) algae, and (f) phage. Each organism finds its optimum environment under fairly restricted environmental conditions. This paper gives examples of the most common micro-organisms and the effect the environment has on their activity. (See also W71-01992). (Christenbury-Iowa State)

AEROBIC TREATMENT OF SWINE WASTE,
Illinois Univ., Urbana.
R. L. Irgens, and D. L. Day.
Laboratory study is reported in more detail in 'Journal of Agricultural Engineering Research', 11: (1) 1-10, 1966, R. L. Irgens and D. L. Day.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 58-60. 8 fig, 3 tab.

Descriptors: *Farm waste, *Aerobic treatment, *Aeration, Biochemical oxygen demand, Chemical oxygen demand, Oxidation.
Identifiers: Swine waste, Waste collection pits, Slotted-floor, Oxidation ditch.

From the results of these tests, it was calculated that for aerobic stabilization of the waste, about 6 cu. ft. of tank volume per pig would be required and approximately 1.2 lb 02 per lb of BOD (0.65 lb BOD per 125-lb pig per day), or 2500 cu. ft. of air pen lb of BOD at 3 per cent efficiency of oxygen utilization. The aerobic process for treating swine waste is odor-free and does not attract flies. The only gas that is produced is carbon dioxide which to a large extent will remain in solution as bicarbonate. The organic matter that is not oxidized to carbon dioxide and water is converted to stable solids, which are easily dewatered and dried on a sand bed. The effluent has a low BOD and is free from ammonia. It seemed feasible to develop an oxidation ditch inside a swine production bulding utilizing self-cleaning slatted floors. (See also W71-01992). (Christenbury-Iowa State)
W71-02010

OPERATING CHARACTERISTICS OF TWO AEROBIC-ANAEROBIC DAIRY MANURE TREATMENT SYSTEMS,
Massachusetts Univ., Amherst. Dept. of Agricultural Engineering; and New Holland Machine Co., Pa.
N. W. Webster, and J. T. Clayton.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No. SP-0366, Michigan State University, May 1966, p 61-65. 2 tab, 14 fig, 20 ref. USDI water research act of 1964 (Public Law 88-379).

Descriptors: *Farm wastes, *Anaerobic conditions, *Aerobic conditions, *Aeration, Sedimentation, Dissolved oxygen, Biochemical oxygen demand.
Identifiers: *Dairy manure, Aerators, Aeration tanks, Sedimentation tanks, Systems, Volatile solids.

Two aerobic waste-treatment systems were designed and tested for use in treating dairy manure. The systems were combinations of aeration and settlement for the purpose of reducing the pollution capabilities of the waste and to make it possible to use the treated effluent for transporting the fresh waste. The system utilizing anaerobic primary settlement and secondary aeration system was selected as the best suited for agricultural use. A system using primary aeration with secondary settlement did not operate satisfactorily. (See also W71-01992) (Christenbury-Iowa State)
W71-02011

ON-SITE COMPOSTING OF POULTRY MANURE,
Auburn Univ., Ala. Dept. of Agricultural Engineering.
J. R. Howes.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 68-69.

Descriptors: *Farm wastes, *Poultry, *Aerobic conditions, Microorganisms, Peat, Cellulose, Aerobic treatment.
Identifiers: *Composting, Fecal material, *Litter, Heat of composting, *Litterlife.

Although composting dates back to antiquity, the composting of poultry litter in situ is new. A culture of 46 species of micro-organisms was mixed into a base of peat and various minerals. This active mixture was spread at the rate of 1/2 lb. per sq. ft. on poultry litter that was at least 6 in. deep and contained an appropriate balance of cellulose and fecal material. Water used to clean the house interior was added to the litter and then mechanically mixed to initiate aerobic action. After heat of composting had subsided, birds were placed on the litter. This process is relatively inexpensive. It overcomes problems associated with obtaining and disposing of litter; provides odor and fly-free environments; permits birds to be safely replaced on the same litter shortly after diseased stock has been removed or the houses flooded; permits humidification of poultry houses; keeps dust to a minimum and enables house interiors to be washed, thus increasing sanitation and equipment efficiency. W71-02013

PRIMARY TREATMENT OF SWINE WASTES BY LAGOONING,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
T. L. Willrich.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 70-74. 2 fig, 7 tab, 14 ref. U. S. Public Health Research Grant EF00410.

Descriptors: *Farm wastes, *Anaerobic conditions, *Design criteria, *Performance, Lagoons, Anaerobic bacteria, Chromatium, Rhodothece, Odor, Gases, Sludge.

Identifiers: *Sludge accumulation, *Swine wastes, *Waste treatment lagoons, *Anaerobic lagoons, Micro lagoons, Lagoon feeding, Gas production, Odor production.

A brief history of lagooning at Iowa State University is presented. The design and problems associated with operation of the lagoon are presented. Data was taken over a period of 8 years to arrive at recommendations for construction of lagoons. Factors discussed include: detention times and sludge accumulations, loading rates, lagoon performance, gas production, odor production, micro-lagooning, lagoon feeding, and design criteria. The recommended design criteria are: (1) For anaerobic lagoons which will receive fairly uniform and frequent (one-a-week or less) loadings: allow a minimum of 1 cu. ft. of lagoon water volume per pound of total animal weight confined in a hog-finishing building, plus additional lagoon volume for sludge storage. (2) For lagoons which will recieve non-uniform and intermittent loading: allow a minimum of two cu. ft. of lagoon water volume per pound of total animal weight confined in a hog-finishing building, plus additional lagoon volume for sludge storage. (See also W71-01992) (Christenbury-Iowa State)
W71-02014

DESIGN CRITERIA FOR ANAEROBIC LAGOONS FOR SWINE MANURE DISPOSAL,
Nebraska State Dept. of Health, Lincoln.
David R. Curtis.
Proceedings National Symposiun on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 75-80. 5 fig, 5 tab.

Descriptors: *Farm wastes, *Anaerobic conditions, *Chemical oxygen demand, *Biochemical oxygen demand, *Odor, *Hydrogen ion concentration, Lagoons, Temperature, Oxidation-reduction potential, Alkalinity.
Identifiers: *Kjeldahl nitrogen, *Volatile acids, *Swine waste, Anaerobic lagoons.

On-site investigations were conducted at 10 selected lagoons to confirm data collected through questionnaires and to observe the actual operation. Data collected included: Number of swine served, sketch of the plan and elevation views, chemical data on samples collected at various times during the study, and a typical cross section of the lagoons showing how solids have accumulated. The temperatures in the lagoons ranged from 70 to 80 F, with temperatures of 75 F and above more prevalent. Oxidation reduction potential (ORP) data indicated that anaerobic conditions were present at all times in the lagoons. Chemical analyses have proved to be effective diagonostic instruments in evaluating the probable cause of objectional odors from lagoon installations. The determinations of greatest significance were pH, Kjeldahl nitrogen, volatile acids, alkalinity, BOD and COD. Design criteria for hog lagoon installations for Nebraska are given. Operational procedures are outlined that should improve the chances for successful lagoon operations. (See also W71-01992) (Christenbury-Iowa State)
W71-02015

CATTLE-MANURE TREATMENT TECHNIQUES,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
R. W. Agnew, and R. C. Loehr.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 81-84. 1 fig, 5 tab, 10 ref.

Descriptors: *Farm wastes, *Lagoons, *Anaerobic digestion, *Aeration, Activated sludge, Solid wastes, Runoff, Chemical oxygen demand, Biochemical oxygen demand, Laboratory tests, Alkalinity.
Identifiers: *Waste characteristics, *Polishing unit, *Anaerobic lagoons, *Aeration systems, Settled solids, Solids handling, Solids disposal, Runoff control, Volatile acids, Kjeldahl nitrogen.

The characteristics of commercial lagooning operations were discussed. It was pointed out that there was a need for extensive planning in the design and operation of lagoons. It was suggested that a combination of an anaerobic lagoon and an aeration unit may be most practical for most installations. Data was presented and discussed concerning the characteristics of anaerobic lagoons, aeration systems, and the settled solids. A potential treatment facility was proposed and discussed as to the cost, colids handling, solids disposal, efficiency, and runoff control. (See also W71-01992) (Christenbury-Iowa State)
W71-02016

DEWATERING CHICKEN MANURES BY VACUUM FILTRATION,
Clarkson Coll. of Technology, Potsdam, N.Y., and New York State Dept. of Health, Albany.
E. A. Cassell, A. F. Warner, and G. B. Jacobs.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 85-91. 5 tab, 9 fig, 32 ref. N.Y. State Dept. of Health (Contract No. C-18768).

Descriptors: *Farm wastes, *Sludge treatment, *Poultry, *Dewatering, Laboratory tests, Sewage sludge, Filtration, Municipal wastes.
Identifiers: *Sludge conditioners, *Vacuum filtration, Chemical-sludge conditioners, Conditioner dosage, Liquid requirements, Solids demand.

The sludge conditioning and vacuum filtration characteristics of sewage sludges and chicken manures were found to be vastly different. Most of the sewage sludges were dewatered with FeC13, FeC13 and lime conbinations, cationic polyelectrolyte, and non-ionic polyelectrolyte sludge conditioners. None of these effectively promoted the dewatering of chicken manures. On the other hand, the anionic polyelectrolyte effectively dewatered chicken manure, but not the sewage sludges. The anionic polyelectrolyte can reduce the specific resistance of chicken manures by as much as a factor of 15 and produce filter cakes with as high as 25 percent total solids. (See also W71-01992) (Christenbury-Iowa State)
W71-02017

REMOVAL OF MOISTURE FROM POULTRY WASTE BY ELECTRO-OSMOSIS (PART I),
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
Otis E. Cross.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 91-93. 7 fig.

Descriptors: *Farm wastes, *Dewatering, *Electro-osmosis, Laboratory tests, Cathodes, Poultry.
Identifiers: Moisture distribution, Expelling water.

This investigation was designed to determine the effectiveness of expelling water from poultry excrement by the electro-osmosis phenomena. Three factors were selected as being the most critical: amount of electric current, time, and distance between electrodes. Twelve plastic tubes were placed in a horizontal position. Each tube was 2 in. ID and 65 cm. long. The piston-type anode was carbon and maintained constant pressure upon the excrement sample by means of a weighted-lever arrangement. The cathode was a 1 mm. copper screen. The tests were conducted with three sample lengths: 40, 25, and 10 cm. The electro-osmosis phenomena produced a 57 percent decrease in moisture content. The amount of expelled water was a function of current flow, time, length of sample, and moisture content of the sample. (See also W71-01992) (Christenbury-Iowa State)
W71-02018

REMOVAL OF MOISTURE FROM POULTRY WASTE BY ELECTRO-OSMOSIS (PART 2),
Michigan State University, East Lansing. Dept. of Agricultural Engineering.
F. V. Nurnburger, C. J. Mackson, and J. Davidson.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 93-95. 7 fig.

Descriptors: *Farm wastes, *Electro-osmosis, *Dewatering, Poultry.
Identifiers: *Joule heating, *Gravity flow, Current flow.

This investigation was undertaken to study the effects of various electrode materials on the liquid expelled from chicken excrement by the process of electro-osmosis. It utilized the effects of joule heating and gravity flow. The results from using 5, 10, 15, and 20 v d-c were that 20 v d-c gave the best results. Of the three materials used, stainless steel gave the best performance, copper was the poorest, and steel was intermediate. The maximum moisture-content reduction was 4.8 percent wb based on 22 hr. of operation at 20 v. This was not sufficient to reach a pelletable level from the initial value of 80 percent wb. The cost of the electric energy used was 12.7 cent per gallon of liquid removed based on the rate of 2 cent per Kw-hr. (See also W71-01992) (Christenbury-Iowa State)
W71-02019

DESTRUCTION OF CHICKEN MANURE BY INCINERATION,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
A. T. Sobel, and D. C. Ludington.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 95-98. 2 tab, 4 fig, 12 ref. N.Y. State Department of Health (Contract No C18965).

Descriptors: *Farm wastes, *Incineration, Poultry, Laboratory tests, Heat balance, Natural resources.
Identifiers: *Combustion, *Solid fuels, Volatile solids, Mass balance, Fixed carbon, Ash, Heat of combustion, High heat value, Low heat value, Energy balance.

The volatile solids in chicken manure represents considerable energy. Incineration is a process which utilizes this energy for destruction of the organic portion of the manure. The application of existing combustion theory to the incineration of chicken manure is difficult beacuse of lack of basic property information and the variability of the material. The incineration process is very dependent on the moisture content of the manure. A laboratory incinerator has been constructed to investigate the incineration process. Initial trials of the incinerator have been restricted to partially dried manure. Considerable information has been obtained. Future application of incineration will depend on cost factors and possible air pollution hazards. A mass and heat balance for a typical incineration trial is given in an Appendix to the paper. TREATMENT OF DUC. WASTES AND THEIR EFFECTS ON WATER QUALITY,
Virginia State Water Control Board, Richmond.
R. V. Davis, C. E. Cooley, and A. V. Hadder.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 98-105, 10 tab, 7 ref.

Descriptors: *Farm wastes, *Coliforms, *Poultry, *Oysters, *Water quality, Salmonella, Biochemical oxygen demand, Environmental effects, Settling basins.
Identifiers: *Rappahannock River, Pilot pond, Barnhardt Farms, Inc., MPN (Most probable number), Raw wastes, Duck run.

Early in 1963 a six-month study was undertaken to determine the effect of coliform organisms in the treated wastes from two duck farms on water quality in an oyster-producing and recreational area of the Rappahannock River near Urbanna, Virginia. Before the treatment facilities were installed, water quality in the area was questionable for recreation purposes and was restricted for direct marketing of shellfish. Treatment consists of alternately used earthen settling basins for removing solids, followed by 4-day retention earthen basins. These remove essentially all settleable solids and reduce the most probable number of coliform organisms per 100 ml. by 90 to 95 percent. On the basis of data collected from the river, restrictions from the public oyster beds were lifted. Satisfactory recreational water quality now exists throughout the area, except very near the discharges. (See also W71-01992) (Christenbury-Iowa State)
W71-02021

VALUE OF BROILER LITTER AS FEED FOR RUMINANTS,
Virginia Polytechnic Inst., Blacksburg; Cornell Univ., Ithaca, N.Y.; and Kansas State Univ., Manhattan.
J. P. Fontenot, A. N. Bhattachanya, C. L. Drake, and W. H. McClure.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 105-108. 7 tab, 11 ref.

Descriptors: *Farm wastes, *Poultry, *Sheep, *Cattle, *Feeds, Proteins, Metabolism, Ruminants, Feeding rates.
Identifiers: Nutritive value, Broiler litter, Digestible protein, Digestible energy, Metabolizable energy, Total digestible nutrients, Carcass grade, Rate of gain.

Information has been presented concerning the nutritive value of broiler litter for ruminants. The litter samples analyzed contained an average of 32 percent crude protein, dry basis. In autoclaved litter, true protein accounted for 45 percent of the total nitrogen. In metabolism trials with wethers, 25 and 50 percent autoclaved peanut-hull and wood-shaving broiler litters replaced corresponding amounts of a corn-hay ration. There were no significant differences in digestible protein, digestible energy, metabolizable energy, and TDN content between kinds and levels of litter. Average values were 22.7 percent, 2440 kcal per kg, 2181 kcal per kg, and 59.8 percent, respectively. It was found in fattening trials that rate of gain and carcass grade were not significantly different for beef steers fed mixtures containing 25 percent ground peanut-hull or wood-shaving broiler litter than for those fed a conventional fattening mixture. (See also W71-01992) (Christenbury-Iowa State)

UTILIZATION OF ANIMAL WASTE AS FEED FOR RUMINANTS,
Auburn Univ., Ala. Dept. of Animal Science.
Aw. brady Anthony.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 109-112. 13 tab, 23 ref.

Descriptors: *Farm wastes, *Cattle, *Chemical analysis, Feeds, Silage, Nutrients, Amino acids, Vitamins.
Identifiers: *Feedlot manure, *Steers, *Digestion coefficients, *Average daily gain, Manure, Carcass data.

Analysis of feedlot manure showed it to be a valuable source of vitamins and amino acids. Washed manure was mixed with a concentrated feed and successfully fed to steers. When unwashed manure was combined with a concentrated mixture or with silage and fed to steers, animal gain and feed efficiency were not improved. Fresh feedlot manure proved to be a valuable ration component when it was either washed or autoclaved. Fresh feedlot manure was blended with coastal bermudagrass hay to make a palatable and nutritious low-moisture silage. (See also W71-01992) (Christenbury-Iowa State)

COPROPHAGY AND USE OF ANIMAL WASTE IN LIVESTOCK FEEDS,
Texas Tech. Univ., Lubbock.
R. M. Durham.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 112-114. 6 tab.

Descriptors: *Farm wastes, *Feeds, *Livestock, Poultry, Cattle, Catfishes, Sheep, Swine, Eggs.
Identifiers: *Coprophagy, *All-concentrate ration, Feedlot steers, Digestion coefficient.

This paper reports observations of coprophagy in cattle consuming an all-concentrate ration and the feeding of rations containing manure from these cattle to poultry, cattle, swine and catfish. The all-concentrate ration was composed of 89% ground milo, 10% cottonseed meal and 1% vitamin-mineral supplement. The manure was ground in a hammer mill without prior drying and mixed with other ration ingredients for feeding. Coprophagy has been observed in cattle consuming limited quantities of the all-concentrate ration. All-concentrate cattle manure has been successfully fed to growing pullets and laying hens. The all-concentrate manure has been fed to feedlot steers with generally favorable results to limit feed consumption. Catfish can make rapid gains on feedlot manure if care is taken to prevent oxygen depletion. (See also W71-01992) (Christenbury-Iowa State)
W71-02024

ROLE OF THE RENDERER IN THE USE AND DISPOSAL OF ANIMAL WASTES,
Triangle E By-Products Co., Harrisonburg, Va.
E. L. Foerster, Sr.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 114-117.

Descriptors: *Farm wastes, Poultry, Cattle, Chemical analysis, Economics, Disposal, Equipment, Digestion tanks, Nutrients.
Identifiers: *Rendering, *Fallen stock, Protein content, Coprophagy.

Mr. Foerster gives a general history of the rendering industry in the United States. He explains the role of the industry in disposing of fallen animals. He gives an analysis for a typical product from a rendering plant. Some data is presented concerning the economics of the rendering process. Through cooperation, the rendering plant can provide a useful and efficient service in disposing of fallen stock. (See also W71-01992) (Christenbury-Iowa State)
W71-02025

EVALUATING ADAPTABILITY OF PASTURE GRASSES TO HYDROPONIC CULTURE AND THEIR ABILITY TO ACT AS CHEMICAL FILTERS,
Agricultural Research Service, Beltsville, Md.; and Maryland Univ., College Park.
Harry J. Eby.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 117-120. 6 fig.

Descriptors: *Farm wastes, *Hydroponics, *Effluents, Nutrients, Municipal wastes, Lagoons, Grasses, Aquatic environment, Root development, Light penetration.
Identifiers: Plant-nutrient removal percentage, Fertilizer value, Nutrient extraction potential, Surface area.

The possibility of using hydroponics as a means of removing nutrients from sewage-treatment plants and lagoons is discussed. Several grasses were studied with rye and tall fescue showing the most promise. Data is presented in graph form showing the plant-nutrient removal percentages. Two appendices are given. Appendix I shows the projected yield capabilities of the various forage grasses with the nutrient-extraction potential based on laboratory-scale sampling. Appendix II shows the method for computing the size of the hydroponic system required for any given volume of effluent. (See also W71-01992) (Christenbury-Iowa State)

PROBLEMS OF CATTLE FEEDING IN ARIZONA AS RELATED TO ANIMAL-WASTE MANAGEMENT,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
Thomas M. Stubblefield.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 120-122. 11 ref.

Descriptors: *Farm wastes, *Cattle, *Legal aspects, Relocation, Area development, Odor, Arizona.
Identifiers: *Cowtowns, *Feedlots, Metropolitan areas, Manure.

Problems associated with locating large numbers of cattle near metropolitan areas are discussed. The particular problems with large feeders in Arizona and their solutions are presented. Feedlot manure selling for as high as $5 per ton in the 1940's now is a liability costing $1 to $1.50 per ton to remove. It has been advantageous for the feedlots to relocate near farming areas for more efficient disposal of the manure. To circumvent problems with residential areas, 'cowtowns' are being developed. W71-02028

ECONOMICS OF LIQUID-MANURE DISPOSAL FROM CONFINED LIVESTOCK,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Economics.
W. H. M. Morris.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 126-131. 6 tab, 1 fig, 16 ref.

Descriptors: *Farm wastes, *Cost analysis, *Disposal, *Value, *Nutrients, Chemical oxygen demand, Biochemical oxygen demand, Cost comparison, Economic feasibility, Economics, Anaerobic conditions, Aerobic treatment, Liquid wastes, Irrigation.
Identifiers: *Production model, Losses in storage, Value of manure, Utilization, Oxidation ditches.

Some of the problems in estimating the costs and returns from handling manure have been discussed. Removal of the manure from the livestock production areas has not been discussed. In general, the scale and efficiency of the operation and prevention of dilution of the manure determine if the manure can be spread in the fields at a cost equal to or less than the value of the nutrients used by the crop. Aerobic and anaerobic treatment of manure in special low-cost facilities designed for use on the farm seem to be practical solutions. No profitable method of industrial utilization of livestock manure can be forseen. (See also W71-01992) (Christenbury-Iowa State)
W71-02029

POULTRY MANURE MARKETING,
Pennsylvania State Univ., University Park.
Herbert C. Jordan.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 132-133.

Descriptors: *Farm wastes, *Marketing techniques, Fertilizers, Poultry analysis, Value, Economics.
Identifiers: *Bagging, *Processing.

A survey was conducted between 1961 and 1963 concerning marketing poultry manure. Information concerning the following topics was collected: General, Bagging Manure, Processing, Supplemental Mixture, and Marketing. Cost associated with bagging and minimum analysis (nitrogen, phosphoric acid, potash) is given for bags ranging from 2.5 to 80 pounds per bag. A summary of the data is presented pointed out that fresh manure is worth about $5 a ton to the soil ($20 per ton on a dry weight basis). Poultry manure used as an organic soil conditioner is and perhaps will remain the greatest and most common use of poultry manure. (See also W71-01992) (Christenbury-Iowa State)

FARM-WASTE MANAGEMENT TRENDS IN NORTHERN EUROPE,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
E. P. Allred.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 133-136. 1 fig.

Descriptors: *Farm wastes, *Disposal, Equipment.
Identifiers: *Northern Europe, Family-size farm, Oxidation ditches, Disposal practices.

Farmers throughout most of northern Europe are faced with many of the same waste-disposal problems as those confronting American farmers. Methods and equipment used for waste disposal are discussed with emphasis on the 'family-size' farm. Those individuals working with oxidation ditches are quite optimistic with its performance. When one compares rural waste-disposal practices in Europe with those in America, there are noticeable differences in both equipment and methods. Surprisingly the greatest differences occur, however, in the people themselves and their attitude toward rural waste disposal. (See also W71-01992). (Christenbury-Iowa State)

PLANT RESPONSE TO MANURE NUTRIENTS AND PROCESSING OF ORGANIC WASTES,
Forschungsanstalt fuer Landwirtschaft, Brunswick (West Germany).
Cord Tietjen.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 136-140. 3 tab, 9 fig, 12 ref.

Descriptors: *Farm wastes, *Liquid wastes, *Nutrients, Urine, Nitrogen cattle, Swine, Fertilizers.
Identifiers: *Gulle, *Plant response, Plant nutrients, Manuring, Feces.

To produce gulle (liquid manure) from cattle feces and to apply it for manuring, the grassland has for a long time been the common way of disposal of animal waste in the Alpine foreland. New labor-saving barn arrangements, tools and implements promote the practice of gulle utilization both for grassland and cropland. It was learned by field and pot experiments that gulle can exert a strong influence on plant growth. The physiological efficiency of gulle nitrogen is several times higher than that of nitrogen in common barnyard manures. Range of variation is great depending on gulle processing and composition. Quality of manure, its contents and ratio of plant nutrients depend on kind of animals, individual properties of animals, feeding, dilution by water or other additives, barn arrangement, collection and storage facilities. It is recommended that animal excrement be processed to a standardized manure - a full gulle that can be characterized by its ratio of plant nutrients. (See also W71-01992). (Christenbury-Iowa State)

THE EFFECTS OF FARMYARD MANURE ON MATRIC SUCTIONS PREVAILING IN A SANDY LOAM SOIL,
National Vegetable Research Station, Wellesbourne (England).
P. J. Salter, G. Berry, and J. B. Williams.
Journal of Soil Science, Vol 18, No 2, 1967, p 318-328. 3 fig, 2 tab, 25 ref.

Descriptors: *Farm wastes, *Soils, *Soil moisture, Field capacity, Wilting point, Equations.
Identifiers: *Soil matric suctions, Ryegrass, Available-water capacity, Moisture characteristic.

Soil matric suctions under a crop of ryegrass on farmyard manure-treated and untreated plots were determined over a total period of 24 weeks from March to November. The soil moisture characteristic of each plot was determined five times throughout this period, and for each plot and on every occasion a linear relationship was found between moisture content and log matric suction. A formula was derived to account for the seasonal changes in moisture characteristic - and it was then possible to obtain matric suction values from the soil moisture contents obtained from twice-weekly sampling of each plot. Although differences between available-water capacity of the manured and unmanured plots were small throughout the 6-month period of sampling, the soil matric suctions of the manured plots were almost always lower than those of the unmanured plots. The lower suctions prevailing in the manured soil could be a factor contributing to the higher yields of ryegrass obtained from the manured plots as compared with those obtained from the unmanured plots. STREAM ENRICHMENT FROM FARM OPERATIONS,
Wisconsin Univ., Madison.
Neal E. Minshall, Stanley A. Witzel, and Merle S. Nichols.
Journal of the Sanitary Engineering Division, Proceedings of ASCE, Vol 96, No SA2, April 1970, p 513-524. 2 fig, 5 tab, 4 ref.

Descriptors: *Farm wastes, *Fertilizers, *Runoff, Nitrogen, Phosphorus, Potash, Wisconsin, Water pollution, Nutrients, Precipitation, Rates of application, Corn, Frozen ground.
Identifiers: *Nutrient losses, Collection tanks.

In order to obtain information on the amount of fertilizer materials lost in runoff water from farm lands under cultivation, eight plots, 10x40 ft. in size, were established on the University of Wisconsin Agricultural Experiment Station Farm near Lancaster, Wisconsin. Investigations involving fertilizer and manure applications and losses in surface runoff were begun in 1966 and were continued through 1969. Each plot was completely surrounded by a galvanized metal border which prevented surface runoff from entering or leaving the plots, located on a 10% to 12% slope. Runoff was collected in a trough at the lower end and funneled to a measuring tank. Manure was applied at the rate of 15 tons per acre in the winter and spring. Later corn was planted in 30 inch rows on the contour. Up to 20% of N, 13% of P, and 33% of K nutrients in winter applied manure, on frozen ground, may be lost under conditions favoring maximum early spring runoff. Nutrient losses in surface runoff from plots having manure applied in the summer and incorporated into the soil were less than from check plots, which received no manure. (White-Iowa State)

MANURE MANAGEMENT - COSTS AND PRODUCT FORMS,
Los Angeles County Agricultural Extension Service, Calif.
J. Van Dam, and C. A. Perry.
California Agriculture, Vol 22, No 12, December 1968, p 12-13. 2 tab, 2 fig.

Descriptors: *Farm wastes, *Cattle, *Marketing, *Costs, Volume, Profit, Management.
Identifiers: *Feedlots, *Processing plant, Stockpiles, Packaging, Bulk, Pulverizer, Product forms, Delivery, Removal.

A study to determine the actual cost of removal and disposal of manure from a beef feedlot in Los Angeles County was completed by the Agricultural Extension Service. Manure was prepared for marketing in three basic forms and sold under four pricing conditions. Manure processing, packaging and marketing began with the mounding of the manure in the corrals followed by its removal to a compost stockpile. Manure was allowed to cure in a compost pile at least six months before processing. The manure could then be marketed unprocessed as composted manure; marketed processed as composted bulk; and marketed processed as composted packaged manure. The combined fixed and variable costs per cubic yard amounted to 10.5 cents for the unprocessed product, 65 cents for the processed bulk and $1.88 for the packaged processed form. The weighted average price received per cubic yard was $3.80 for the packaged, $2.40 for the processed bulk, and $1.40 for the unprocessed bulk manure. A livestock feedlot operator can probably make a profit from the sale of manure. (White-Iowa State)

OXIDATION DITCHES FOR WASTE DISPOSAL,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Donald L. Day.
International Journal Of Farm Building Resources, No 2, December 3, 1968, p 2-7. 9 fig, 9 ref.

Descriptors: *Farm wastes, *Hogs, *Biochemical oxygen demand, *Rotors, Foaming, Sludge, Effluent, Odors, Carbon dioxide, Oxygen, Depth, Dissolved oxygen, Electric power, Electric power costs, Volume, Velocity.
Identifiers: *Oxidation ditch, Population equivalent, Suspended solids, Slatted floors, Extended aeration.

The oxidation ditch is an efficient low-cost process for the treatment of municipal waste. It has several aspects that seem desirable for use in confinement livestock waste-treatment systems. The aerobic method is an odorless process with final products of water, carbon dioxide, and stable minerals. The oxidation ditch can be integrated into a self-cleaning slatted floor system. However, control of foaming is an immediate problem that must be solved before the process can be unconditionally recommended, even just for control of the odors in the gutter and when spreading on land. Operational criteria must be developed if the method is to serve for complete treatment of livestock manure, with an effluent that can be accepted by public health and water board standards. Adaptations of the oxidation ditch for the treatment of livestock manure are surely forthcoming, in view of the intense research that is in progress in the United States and abroad. However, until the current problems are resolved, the disposal of livestock manure in a manner that does not have an odor nuisance and a water pollution hazard remains a complicated problem. (White-Iowa State)

DRYING POULTRY MANURE INSIDE THE POULTRY HOUSE,
Pennsylvania State Univ., University Park. Dept. of Poultry Science.
Glenn O. Bressler.
Agricultural Engineering, Vol 51, No 3, p 136, March 1970.

Descriptors: *Farm wastes, *Poultry, *Drying, Ventillation, Waste storage.
Identifiers: *Poultry manure.

In this drying system droppings are removed at a very low moisture level, cutting weight of material to be handled by two-thirds. Eight 3000-cfm circulating fans are mounted about 22 ft. apart directly below 2 lines of water troughs that run the full length of the house. Fans are about 10 in. above the manure; air velocities over the droppings are about 250 to 750 fpm. A spike-tooth harrow is pulled daily through the accumulating droppings to stir them and to draw partially dried droppings into the high-velocity airstream. From the pit the droppings go either to truck or manure spreader or to a hammermill to be finely ground and bagged. The amount of water removed daily to prevent excess humidity and to dry the manure ranged from 6-9 gallons per hour. These results are from a flock of 3246 pullets and cockerels at 22 weeks in a 30-ft. by 100-ft. environment-controlled laying house. (White-Iowa State)

SWINE MANURE -- LIABILITY OR ASSET,
Purdue Univ., Lafayette, Ind.
David H. Bache.
Paper presented at the American Pork Conference, Des Moines, Iowa, March 3, 4, and 5, 1970. 13 p, 10 ref.

Descriptors: *Farm wastes, *Economics, *Costs, Water pollution, Air pollution, Confinement pens, Storage capacity, Fertilizers, Swine, Cattle, Poultry, Lagoons, Odor, Oxidation, Legislation.
Identifiers: *Assets, *Liability, Slatted floors, Land disposal, Innovators penalty, Pollution abatement grants.

Swine manure is a very modest asset on crop farms and it can be a major liability on those production units with no crop land base. A literature and research review gives costs and economic value of different manure treatment systems through the past ten or fifteen years. Conclusions reached include: there is no waste disposal problem with a pasture system, there is no economically feasible alternative to the spreading of solid manures, smaller swine production units will probably find that lagoon disposal is the optimum technique for handling hog wastes, and larger production units will be shifting to the use of slatted-floors, under floor manure forage, and liquid disposal systems. Public concern and legislation is discussed. (White-Iowa State)
W71-02047

PROCEEDINGS OF ANIMAL WASTE MANAGEMENT CONFERENCE.
Federal Water Pollution Control Administration, Kansas City, Mo.

Kansas City, Department of the Interior, February 1969. 40 p.

Descriptors: *Farm wastes, *Cattle, *Water pollution control.
Identifiers: *Feedlot pollution control, *State status reports, Animal production, Model feedlot regulation, Animal waste management.

An objective of the conference was to review the problem, as it exists today, of animal waste management. Information was given on how to conduct a state inventory of feedlots. A report was given on the Kansas animal waste control program. Control devices for animal feedlot runoff were discussed. The results of some feedlot pollution control research in Colorado and Nebraska was given. Status reports of 9 state pollution control programs were given, as well as model feedlot regulation design. (White-Iowa State)

WATER SUPPLY AND POLLUTION CONTROL PLANS FOR VOLUSIA COUNTY, FLORIDA.
East Central Florida Regional Planning Council, Titusville.

Available from NTIS as PB-190 810, $3.00 in paper copy, $0.95 in microfiche. Volusia Council of Governments Report, March 1970. 275 p, 26 tab, 17 ref.
Identifiers: *Water supplies, *Florida, *Sanitary engineering, Urban planning, *Water pollution, Control, Sewage, Population, Costs, Water resources, *Volusia County (Fla), Regional planning and development.

The report presents the findings of a long-range planning study to determine water and sewerage facilities requirements for Volusia County at the year 2000.
W71-02050

INVESTIGATION OF PERFORMANCE CHARACTERISTICS FOR SANITARY PLUMBING FIXTURES.
National Bureau of Standards, Washington, D.C. Building Research Div.

Available from NTIS as PB-189 456, $0.70 in paper copy, $0.95 in microfiche. NBS Building Science Series B5522, Jan 1970. 68 p, 30 tab, 25 fig, 38 ref.
Identifiers: *Sanitary engineering, Test methods, Reinforced plastics, Wear resistance, Glass textiles, Shock resistance, Thermal shock, Defects (Materials), Specifications, Impact shock, Performance (Engineering), Standards, *Plumbing fixtures.

The report gives findings and recommendations developed during an investigation of performance characteristics for sanitary plumbing fixtures. The report describes the test methods that are recommended for the evaluation of 16 performance characteristics, and the nature of further work required to complete the development of four or five additional test procedures. The suitability of various existing test methods for evaluating the functional and performance characteristics of sanitary plumbing fixtures was investigated in the laboratory. In addition, new or modified tests for certain characteristics were developed. The laboratory work was performed only on bathtubs and flat specimens provided by industry. Field inspection trips were made to provide the NBS project staff with up-to-date information on certain manufacturing processes and on installation and use problems. The complexities involved in the selection of valid performance levels are discussed, as well as the elements of judgment involved. A format that might be used in specifying performance is suggested for each test procedure and the rationale underlying each suggested format is given.
W71-02052

SPECIAL REPORT: COOLING TOWERS.

Industrial Water Engineering, Vol 7, No 5, p 22-53, May 1970.

Descriptors: *Cooling towers, *Thermal pollution, *Cooling water, Industrial water, Heat transfer, Evaporation, Heat balance, Vapor pressure, Thermal power plant, Environmental effects.
Identifiers: Impact of cooling towers.

A special report consisting of several contributions is presented. This report is divided into five sections: (1) tower section; (2) water-consumption; (3) chemical treatment; (4) automatic controls; and (5) field evaluation of the tower. The use of evaporative cooling towers rather than once-through systems could increase the cost of generating power by as much as 5%. Cooling tower selection is dependent on (1) amount of cooling water, (2) entering water temperature, (3) leaving water temperature, (4) temperature of the air entering the tower. The possibility of water reuse is discussed. The cooling operation can be automated and automatic control systems are described. Four types of pollution exist, thermal, steam, air, and land which have to be taken into account when towers are considered. (Novotny-Vanderbilt)
W71-02064

COOLING TOWER DESIGN CRITERIA AND WATER TREATMENT,
Black and Veatch, Kansas City, Mo.
F. W. Motley, and T. C. Hoppe.
Cooling Tower Institute Meeting, Aspen Colorado, June 22-25, 1970. 15 p.

Descriptors: *Cooling Towers, *Design criteria, Cooling, *Thermal Pollution, Heat budget, Evaporation, Environmental effects, Thermal power plants, Nuclear power plants, Heat water purification, Waste water disposal, Corrosion control, Biological properties.
Identifiers: Cooling Tower design.

Major considerations involved in selecting the cooling water system of a large industrial plant are presented in this paper. Cooling tower specifications and testing are reviewed. The paper also presents considerations for the water treatment and waste water disposal of a cooling water system utilizing a tower. Approximately 50% of the heat input to a modern fossil fueled unit is rejected to the cooling water. A nuclear fueled unit rejects about 50% more heat than a fossil fired unit per kw hour. A basic cooling system which is described further has been applied. Some practical experiences with cooling system operating are discussed from the standpoint of process control, process leaks, corrosion, chemical conditioning, blowdown, biological and microbiological problems, etc. (Novotny-Vanderbilt)
W71-02073

CONTROL OF COOLING TOWER MIST,
Celanese Chemical Co., Clarkwood, Tex.
R. H. Maurer.
Cooling Tower Institute, Semi annual Meeting, Snow-at-Aspen, Colorado, June 22-24, 1970. 7 p, 3 fig.

Descriptors: *Cooling towers, Fog, *Thermal pollution, Temperature, Safety, Mist heated water.
Identifiers: Visibility hazard, Exhaust air, Gas burners.

Means of solving a visibility hazard due to mist from cooling towers are described: Possible methods of controlling cooling tower mist emission are (1) installations of electrostatic precipitators on the cooling tower exhaust air, (2) elimination of fog particles by impingement upon wiremesh, (3) by seeding, (4) chemical spraying, (5) by the nylon string fog dispersion method, (6) heating the cooling tower exhaust air with steam heating coils and (7) with natural gas burner. It was found that exhaust re-heat method was the best solution to the problem. Safety from fires is a major concern. The total cooling water circulation rate is 116,000 gpm with 17.9F average temperature difference across the cooling towers which have the mist control facilities. The anticipated maximum natural gas requirement is 16.5 mm SCFD under average fogging condition. (Upadhyaya-Vanderbilt)

IRRIGATION WITH RECLAIMED WASTEWATER,
Hirsch and Koptionak, San Diego, Calif.
Lawrence Hirsch.
In: Shuval, H. I., editor, Developments in Water Quality Research, Ann Arbor-Humphrey Science Publishers, Ann Arbor, Michigan, 1970, p 251-258. 5 ref, 1 tab, 1 fig.

Descriptors: *Water reuse, Rates, Irrigation efficiency, Nutrient requirements.
Identifiers: *San Diego County, Hershkovitz, Feinmesser, Los Angeles Chamber of Commerce.

Since the projected cost of potable water per acre foot in San Diego County, California is expected to double within ten years, the author stresses the need for 'intensified future utilization of reclaimed waste water.' Although he mentions some of the detrimental chemical and public health factors. he concludes that reclaimed water contains a higher level of plant nutrient value and if 'well-oxidized, non-putrescible and reliably disinfected or filtered' is not harmful to health. In addition, the nitrogen, phosphorus and potassium found in reclaimed water is marketable as fertilizer. (See also W71-02102) (Holmes-Rutgers)

THE OUTLOOK FOR WASTE WATER UTILIZATION IN ISRAEL,
Technion - Israel Inst. of Tech., Haifa. Sanitary Engineering Labs.
Alberto M. Wachs.
In: Shuval, K. T., editor, Developments in Water Quality Research, Ann Arbor-Humphrey Science Publishers, Ann Arbor, Mich., 1970, p 109-123. 12 ref, 5 fig, 2 tab.

Descriptors: *Water reuse, Cost-benefit analysis, Salinity, Nutrient requirements, Oxidation lagoons.
Identifiers: *Dan Region Project for Waste water Reuse, Parkhurst, Stephan, Weinberger.

In Israel, where 85 percent of available natural water resources are already being utilized 'it becomes necessary to use water from natural resources more than once.' The author discusses the construction and costs of the largest waste water reuse project in Israel, namely the Dan Region Project which includes TelAviv and six surrounding municipalities. Since the alternative to waste water reuse is seawater desalination, the author concludes that the former compares favorably with the latter in terms of costs. Although waste water reuse in agriculture is still a costly undertaking, the author believes that the costs of disinfecting sewage may be able to be met by the savings in chemical fertilizers thereby incurred. COMBINED SEWER CONSIDERATIONS BY PHILADELPHIA,
Philadelphia Water Dept., Pa. Water Pollution Control Div.
Carmen F. Guarino, Joseph V. Radziul, and William L. Greene.
In: Proceedings, American Society of Civil Engineers, Journal of the Sanitary Engineering Division, Vol 96, No SA1, p 1-14, February 1970. 3 fig, 20 ref.

Descriptors: *Sewers, *Pollution abatement, *Methodology, Legislation, Water quality.
Identifiers: *Combined sewers, *Philadelphia, Storm sewers, Sanitary sewers.

City of Philadelphia's experience and study of the combined sewer over-flow pollution problem are described. Water quality legislation and pollution abatement philosophy are considered. The needs for problem definition are delineated along with pertinent constraints of existing methodology and measuring instrumentation. Costs and economic analysis of some abatement schemes are evaluated. Complete separation of stormwater and sanitary wastes, storage in conduit or detention basins, a total systems concept and the microstraining, chlorination, and ozonation of discharges are some of the principles reported for the control and treatment of combined sewer over-flows, or both. Emphasis is directed to the determination of priorities in resolving the overall national pollution problem and the need for a systematic approach. (Davis-Chicago)

Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 34-38. 22 fig, 2 tab, 5 ref. Public Health Research Grant EF-265.

Descriptors: *Pump testing, *Slurries, *Farm wastes, *Waste disposal, *Performance, Waste dilution, Efficiencies, Contrifugal pumps.
Identifiers: Handling, Capacity, Positive displacement, Diaphragm, Input horsepower, Selection criteria.

The purpose of this report was to analyze the performance characteristics of the different kinds of pumps under various conditions. Five pumps, representing centrifugal, positive displacement, and diaphragm types were tested. A pump was always tested with water first. Fresh manure was then mixed with the water to form a slurry. This was kept well mixed both by recirculation by the pump and by continuous mixing of the storage tank. Some 300 individual runs were made in testing the five pumps with three manures at various speeds. Dilution was more important than kind of pump, thin slurries being most satisfactory. Practical and economic conditions are discussed relating to pump selection. (See also W71-01992). (Christenbury-Iowa State)

CATTLE-MANURE HANDLING AND DISPOSAL SYSTEMS ON THE WEST COAST,
Washington State Univ., Pullman. Dept. of Agricultural Engineering.
E. H. Davis.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 45-47. 3 ref.

Descriptors: Cattle, *Farm wastes, *Farm management, Project planning, Environmental sanitation.
Identifiers: Loafing sheds, Liquid manure, *Health authorities, Alleyways, Holding tanks.

Stall housing, an acceptable practice, produces manure which requires special handling. The method of handling and disposing of manure in a sanitary manner depends on climatic conditions and management practices. Disposal of animal wastes is part of the livestock enterprise and should be charged to this operation. As animals and people get closer together in heavily populated areas, disposal of animal wastes in a sanitary manner becomes increasingly important. Close working relationships with state health departments is essential. Additional research is needed concerning lagoon, nitrate contamination of underground

water supplies, grinding units for processing beef and dairy manures, and agitation equipment for large holding tanks. (See also W71-01992). (Christenbury-Iowa State)

ECONOMIC EVALUATION OF LIQUID-MANURE DISPOSAL FOR CONFINEMENT FINISHING OF HOGS,
Illinois Univ., Urbana. Dept. of Agricultural Economics.
Richard P. Kesler.
Proceedings National Symposium on Animal Waste Management, ASAE Publication No SP-0366, Michigan State University, May 1966, p 122-125. 6 tab, 2 ref.

Descriptors: *Farm wastes, *Swine, *Disposal, *Economics, *Annual cost, Lagoons, Storage capacity, Size, Nutrients, Ultimate disposal, Liquid wastes.
Identifiers: Manure, Total lagooning, Hauling and spreading, Recovery rate, Fertilizer nutrients, Salvaged nutrients.

Manure is a valuable by-product of the hog industry. This manure must be disposed of on the land to obtain its inherent value. Factors that should be considered in choosing a manure disposal system are (a) amount of manure that is produced, (b) fertility content of the manure and its value as a replacement for commercial fertilizer, (c) disposal costs of each system, and (d) availability of cropland on which to spread the manure. An extensive economic analysis of three disposal systems is presented: (I) Total hauling and spreading, (II) Total lagooning, and (III) Partial hauling and spreading and lagooning. Three sizes of hog operation were considered in the comparison: 500, 1500, and 2500 head. (See also W71-01992) (Christenbury-Iowa State)

SOFT WATER SUPPLY FOR URBAN CONSUMPTION, A FEASIBILITY STUDY,
Tahal - Water Planning for Israel Ltd., Tel Aviv.
P. Dalinsky.
In: Shuval, K. T., editor, Developments in Water Quality Research, Ann Arbor-Humphrey Science Publishers, Ann Arbor, Mich., 1970, p 79-87. 23 ref, 4 tab, 1 fig.

Descriptors: *Municipal water, Water softening, Expenditures, Economic feasibility, Cost benefit analysis.
Identifiers: *Dan Regional Scheme, American Institute of Laundering, World Health Organization, Holland.

Hard water in Israel causes increased consumer expenditures of soaps and clothes. A comparative economic analysis of three alternative methods of supplying soft water to the 7-city Dan (Tel Aviv) Regional Scheme is presented in this paper. Factors such as savings in soap consumption, reduction in clothes wear-and-tear, savings in salt costs, savings in sewage project investments are included in the feasibility study. The report emphasizes the economic benefits to be derived from the supply of soft water to urban areas. (See also W71-02102) (Holmes-Rutgers)

!dentifiers: Nonlinear programming, Cost minimization, *Delaware estuary, Algorithms.

An application of a non-linear programming algorithm to the problem of optimal water quality control in an estuary is described. The mathematical model that was developed gives the solution to the general mixed case of at-source treatment, regional treatment plants, and by-pass piping. The non-linear algorithm is developed in considerable detail and a sample problem is worked out. Detailed results are presented for a pilot problem to illustrate the method of solution. Actual data from the Delaware Estuary is used to solve a large scale problem and the solution is given. The results indicate that a regional treatment system for the Delaware Estuary is superior, in terms, of total cost, to other proposed schemes. (Graves-UCLA)

COMMENTARY IN SOVIET PERIODICALS ON ENVIRONMENTAL POLLUTION,
Joint Publications Research Service, Washington, D.C.
V. S. Vishnyakov.
Translations of: Priroda, No 4: p 93-97, 1966. Available from NTIS as PB-190 788T, $3.00 in paper copy, $0.95 in microfiche. Joint Publications Research Service Trans 36,815, August 3, 1966, various pagings.
Identifiers: *Air pollution, *USSR, *Water pollution, USSR, Wastes (Industrial), Control, Rivers, Aquatic animals, Industries, Purification, Environment, Contamination, *Air pollution control equipment.

One major contributing factor to the Soviet pollution problem is the divergency between parochial economic benefits and wider public interest. The nature of the Soviet system adds to these difficulties. First, those responsible for making economic decisions with consequences for the pollution situation are subject to incentives and penalties designed to make them maximize production. Second, and more important, the regime's priority attachment to the goal of economic growth diminishes the possibility of its acting as an honest arbiter between narrow economic and overall public interests. It would appear from the writings that the USSR has its share of individuals dedicated to the cause of conservation and that, moreover, these people have a chance to be heard. But aside from passing an occasional anti-pollution decree or fining a blatant malefactor now and then, the regime's growth-at-all-costs orientation is never far from the surface. A collection of Soviet articles on environmental pollution problems in USSR are presented.
W71-01688

VOLUNTARY PRIVATE BEHAVIOR AS A MEANS TO REDUCE CONSUMER HEALTH HAZARDS AND ENVIRONMENTAL POLLUTION,
Brookings Institution, Washington, D.C.
Carl W. Bruch.
Available from NTIS as PB-189 389, $3.00 in paper copy, $0.95 in microfiche. Study Report, 1969. 203 p, 172 ref.
Identifiers: *Public health, Hazards, *Management planning, Environment, Air pollution, Water pollution, Wastes (Industrial), Industrial relations, Attitudes, Organizations, Control systems, Voluntary waste control, Pollution control.

The document is concerned with how much reliance the public should place on voluntary private behavior to protect the environment and the consumer and whether the voluntary activities of industry possessed the potential to obtain necessary changes in environmental quality and protection from consumer health hazards. This study examined the nature of the regulatory process as a legal and administrative tool, the role of incentives and economics in pollution control, and a qualitative estimation of achievements of voluntary private behavior in the reduction of direct health hazards associated with foods, drugs, and cosmetics, and the indirect health hazards from air, water and solid waste pollution.

AN ECONOMIC STUDY OF THE EFFECT OF MUNICIPAL SEWER SURCHARGES ON INDUSTRIAL WASTES,
North Carolina Water Resources Research Inst., Raleigh.
Don E. Ethridge.
Available from NTIS as PB-195 981, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Institute, Report No 41, November 1970. 122 p, 8 tab, 12 fig, 34 ref, 3 append. OWRR A-047-NC (2).

Descriptors: Evaluation, *Costs, Sewers, *Industrial wastes, Poultry, Industrial use (Water), Biochemical oxygen demand, Municipal wastes, Municipal water.
Identifiers: *Sewer surcharges, *Surcharges, *Poultry processing industry, *Beet processing industry.

This study analyzes the industrial response to sewer surcharges (1) in a theoretical framework and (2) using two empirical estimation procedures. The purpose is to develop and appraise alternative methods of studying the response of specific industries. A synthetic or budgeting approach was used to estimate firm's responses for the beet processing and poultry processing industries. It was estimated that a typical beet processing plant would reduce its wasteload discharged by 75 percent if faced with a surcharge of 2 cents per pound of BOD (from 31,600 pounds of BOD (Biochemical Oxygen Demand) per day with no surcharge to 7,770 pounds of BOD per day with a surcharge of 2 cents per pound of BOD). The corresponding estimate for a poultry processing plant was a reduction of 32 percent. It was estimated that the elasticity of total pounds of BOD discharged by beet processing plants with respect to the surcharge on BOD is -.7 at a 'typical' surcharge of approximately 2 cents per pound of BOD. The corresponding elasticity estimate for poultry processing plants was estimated to be -.15. Regression analysis was also used to estimate firms' responses for the poultry processing industry. The resulting estimate of the elasticity of total pounds of BOD discharged with respect to the surcharge was -.23.

SEPARATION OF OIL AND WATER WITH GRAVITY SEPARATOR (FRENCH),
Laval Univ., Quebec; and Hydraulic Research Inst., Bratislava (Czechoslovakia).
K. Rohan, and M. Zajdlik.
English synopsis. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2 (Subject B), Science Council of Japan, Kyoto, p 177-189, 1969. 13 p, 6 fig, 2 tab, 5 ref.

Descriptors: *Water pollution, *Groundwater, *Oil wastes, *Separation techniques, Infiltration, Model studies, Mathematics, Equations, Path of pollutants, Foreign projects.
Identifiers: *Hydraulics Laboratory of Bratislava (Czechoslovakia).

This paper gives the test results and computation methods used in the Hydraulics Laboratory of Bratislava, Czechoslovakia, concerning oil and water mixtures with emphasis on protection of groundwater supplies against pollution from oil pentration. Related equations and graphs are included. It is possible to utilize gravity separators because water and oil usually do not create emulsions. (Woodard-USGS)

REMOVAL OF SALINE WATER FROM AQUIFERS,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
E. J. Carlson, and P. F. Enger.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 121-134, 1969. 14 p, 4 fig, 1 tab, 16 ref.

Descriptors: *Saline water-fresh-water interfaces, *Leaching, *Saline water systems, *Groundwater movement, Drainage systems, Hydraulic models, Mathematical models, Aquifers, Model studies, Drainage programs, Subsurface drainage, Water management (applied).
Identifiers: Aquifer sweetening, Aquifer desalination.

Aquifer desalting was studied in a rectangular, glass-walled, sand-filled tank and in a mathematical model. Two types of aquifers were studied: (1) a 1:40 scale, two-part aquifer (course and fine sand) representing a vertical cross section through an idealized portion of an irrigated valley; and (2) a fine sand, single-part aquifer used to evaluate a formula derived from the Ghyben-Herzberg principle for computing depth to a saline-fresh water interface. Salt water was flushed from the aquifers into subsurface drains by applying fresh water to the surface. Test results for both aquifer types showed that tile drains placed near the ground surface will not intercept and discharge surface-applied fresh water if all or part of the aquifer contains salt water. The fresh water displaces the salt water without appreciable mixing and moves it into the drains. A stable fresh-salt water interface is thereby formed in the aquifer. Reduced spacing of drains reduced the amount of salt water that will be removed from the aquifer. Progress of the tests was recorded in still and timed-sequence motion pictures. (Knapp-USGS)

INVESTIGATION OF AXISYMMETRICAL STRATIFIED FLOW TOWARDS A POINT SINK,
Tokyo Inst. of Tech. (Japan); and Japan Atomic Power Co., Tokyo. Civil Engineering Section.
Mikio Hino, and Sotoaki Onishi.
In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2, (Subject B), Science Council of Japan, Kyoto, p 289-296, 1969. 8 p, 3 ref.

Descriptors: *Water resources, *Stratified flow, *Intakes, *Flow characteristics, Water storage, Withdrawal, Model studies, Theoretical analysis, Water quality, Salinity, Mathematics, Equations, Foreign projects.
Identifiers: Japan.

The flow towards an intake riser pipe is theoretically analyzed as an axisymmetrical flow into a point sink. Experiments were carried out in a lucite tank with a bottom shaped in a 1/4 circle, 60 cm deep. At the center of circle, the tank had a cylindrical outlet with a diameter of 6 cm and 25 cm high into which an intake cylinder with a slot was inserted. Several kinds of intake cylinders, each of which has a different location of the slot, were prepared. Various densities of salt water layers were used, and graphs and diagrams relate flow systems and selective withdrawal. (Woodard-USGS)

EFFLUENT FROM A SLOT INTO STAGNANT OR MOVING AMBIENT FLUID OF GREATER DENSITY,
Hydraulics Research Station, Wallingford (England).
Habib O. Anwar.
French summary. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2, (Subject B), Science Council of Japan, Kyoto, p 297-308, 1969. 12 p, 8 fig, 4 ref.

Descriptors: *Density stratification, *Effluents, *Fresh water, *Heavy water, *Model studies, Mathematics, Equations, Stagnant water, Movement, Density, Profiles, Salinity, Vertical migration, Laboratory tests, Foreign projects, Hydraulic properties.
Identifiers: *Ambient fluid, Hydraulics Research Station (Wallingford, England).

Investigations were conducted at the Hydraulics Research Station, Wallingford, England, to determine the effects of vertically discharging fresh water upward into an ambient fluid of greater density. The ambient fluid was a solution of salt water with uniform density, and was either stationary or moving slowly upward. Density profiles were determined by measuring the concentration of the salt solution using an electrical conductivity probe, and were found to be of Gaussian form close to those of a natural convection plume. The nozzle densimetric Froude number, based on the slot width, ranged from 4 to 10. The results of this investigation are related to an effluent discharged from a long diffuser pipe into sea water. The flow at a small distance from the diffuser can be regarded as a flow from a line source with a finite width. Related graphs and equations are included. (Woodard-USGS)

COMPARISON OF DIFFERENT TYPE COOLING TOWERS FOR GAS TURBINE INLET AIR SERVICE,
West Texas Utilities Co., Abilene.
A. R. Cox.
Cooling Tower Institute, June 22, 1970. 8 p, 3 fig.

Descriptors: Cooling towers, Freezing, Alkalinity, Temperature, Dual system.
Identifiers: Spray-type tower, Gas turbine generators, Compressors, Forced-draft, Wood structure, Topping cycle.

West Texas utilities company has three gas turbine generators and all three units are served by cooling towers to cool and clean the inlet air to the gas turbine compressors, in order to maintain maximum efficiency and capabilities of the units. A combined

cycle arrangement of a 25 mw gas turbine generator with a 100 mw steam turbine generator at San Angelo has proven to be a very efficient arrangement. Operation during cold weather presents a freezing problem in the cooling tower and eliminators. This could result in blockage of the air passages which might damage the cooling tower, the air ducts, or the compressors. An automatic shut down of the circulating water pumps is provided to function at 40F to eliminate the freeze-up hazard. The Rio Pecos gas turbine generator is a 5 mw unit and the inlet air cooling tower is a wood structure, installed in 1954 at a cost of 7,300dollars. Acid is used for alkalinity reduction to hold the basin water pH between 7.0 and 7.5. A brief description and the figures of three cooling towers are shown. (Upadhyaya-Vanderbilt)

THERMAL POLLUTION CONTROL IN BAVARIA,
Bavarian Bureau of Water Supply and Pollution Control, Munich (West Germany).
F. K. Von Ammon.
Proceedings of the 24th Industrial Waste Conference May 6, 7, 8, 1969 Purdue University, p 1357-1360.

Descriptors: *Thermal pollution, Evaporation, Temperature, Self-purification, Cooling water, Reservoirs, Dissolved oxygen, Aeration Analysis.
Identifiers: Water organisms.

The harmful influence of a heat discharge is exerted in three principal ways. These are, evaporation of water, creating a decrease of flow and dilution of other wastes, direct influence of high temperatures on water organisms and reduction of self-purification capacity. For water resources management, there is a need for a simple method of estimating heat load in a certain reach of a river. The next step is to select a permissible maximum temperature in the river. In Bavaria 28C is often used. For the Danube river, which still contains valuable fish and has a lower natural temperature, 25C has been set. Experience has shown that the cooling time often lies in the region of 2-3 days under summer conditions. This means, in an impounded river, that there is the possibility of a power station approximately every 20 km. In several cases, where the receiving water is polluted, the cooling water has to be aerated. (Upadhyaya-Vanderbilt)

A STEADY STATE OPTIMAL DESIGN OF ARTIFICIAL INDUCED AERATION IN POLLUTED STREAMS BY THE USE OF PONTRYAGIN'S MINIMUM PRINCIPLE,
Rutgers - The State Univ., New Brunswick, N.J.; and Electronic Associates, Inc., Princeton, N.J.
Burton Davidson, and Robert W. Bradshaw.
Water Resources Research, Vol 6, No 2, p 383-397, April 1970. 15 p, 13 fig, 1 tab, 17 ref.

Descriptors: *Optimization, *Pollution abatement, *Steady flow, *Digital computers, *Analog computers, Rivers, Aeration, Systems analysis, Constraints, Dissolved oxygen, Biochemical oxygen demand, Laplaces equation.
Identifiers: Algorithm, Pontryagin's minimum principle, Streeter-Phelps equation.

Optimum control theory based on Pontryagin's minimum principle was applied to the problem of specifying the steady state distribution of artificial aeration in polluted rivers. The optimization was developed for a general integral type cost functional with weighted energy contraints. It was composed of four main parts: (1) the objective function, (2) the performance equations, (3) the optimizing algorithm, and (4) the methods of solution. The system equations used were of the classical Streeter-Phelps genre with an induced aeration term added as the control function. A small highly polluted river in a state of steady flow with a typical Streeter-Phelps dissolved oxygen (DO) sag profile, a first-stage biochemical oxygen demand (BOD) profile, and isothermal conditions was considered. The formulation of the problem yielded the famous Riccati-Kalman structure and an analytical solution. Several optimal and suboptimal aeration designs at different temperature levels were obtained using a digital computer and an automatic plotting routine. An analog computer was used in the critical stages of the numerical solutions. Results from the analog computer pointed the way to the ultimate use of Laplace transform techniques in conjunction with a digital computer for maximum accuracy. The basic understanding of how optimal control theory can be used as a systems tool in the analysis of water quality control problems was furthered. (Kriss-Cornell)

ENVIRONMENTAL CONTROL - WATER: MANY GAINS, MUCH TO BE DONE,
Irvin Schwartz.
Chemical Week, Vol 106, No 24, June 17, 1970, p 90-97. 5 fig, 2 tab.

Descriptors: *Pollution abatement, Waste water treatment, Activated carbon, Thermal pollution, Dissolved oxygen, Biological treatment, Industrial water, Optimum development plans, Institutional constraints, Chemical wastes.
Identifiers: *Federal Water Quality Administration, United States Geologic Survey, Z-M process, Polyelectrolytes.

Chemical processing plants are being required to meet stricter water pollution control standards by the federal government. In order to meet the new standards, chemical companies are experimenting with less polluting methods for disposal, processing and using water. In the meantime, before these new methods are put into practice, several new ideas for biologically treating waste waters have been tried. The most discussed idea is activated carbon adsorption of organic pollutants. This article also lists new products which chemical companies have developed to assist treatment processing of industrial water wastes and urges joint industrial and municipal water waste treatment ventures. DEVELOPMENTS IN WATER QUALITY RESEARCH, PROCEEDINGS OF THE JERUSALEM INTERNATIONAL CONFERENCE ON WATER QUALITY AND POLLUTION RESEARCH, JUNE 1969.
Hebrew Univ., Jerusalem (Israel).

H. I. Shuval, editor. Ann Arbor-Humphrey Science Publishers, Ann Arbor, Michigan, 1970.

Descriptors: *Water quality control, Waste water treatment, Return flow, Administration, Municipal water.
Identifiers: *Israel's National Water System, Jordan Project, Lake Kinneret, Dan Region Project.

This book is the published proceedings of the Jerusalem International Conference on Water Quality and Pollution Research, held at Hebrew University in June, 1969. The book includes twenty papers, divided into three general subject areas; water quality management, waste water treatment and utilization, and marine pollution. Half of the papers were written by Israeli Scientists and engineers, while the other half were written by South African and United States researchers in these fields. Appropriate portions of the publication are forwarded with abstracts of those portions. (See also W71-02103 thru W71-02106) (Holmes-Rutgers)

WATER QUALITY MANAGEMENT OF THE ISRAEL NATIONAL WATER SYSTEM,
Mekorot Water Company, Tel Aviv (Israel).
Yehuda Goldshmid.
In: Shuval, K. T., editor, Developments in Water Quality Research, Ann Arbor-Humphrey Science Publishers, Ann Arbor, Mich., 1970, p 3-17. 18 ref, 1 fig, 1 tab.

Descriptors: *Water management (Applied), Water quality control, Administration, Water resources development.
Identifiers: *Jordan Project, Lake Kinneret, Israel National Water System.

The construction, operation and management of the Jordan System, the largest single water supply project in Israel, is analyzed in detail in this paper. Although 80 percent of the water pumped through this system was intended for use in agriculture, it was constructed so that all the water could be treated and maintained at drinking-water standards. Therefore, Lake Kinneret, its watershed, the open canal and the reservoirs were viewed as one unit. The author points out however, that although the system has been in operation for five years, a watershed authority has not yet been created, thereby reducing the potential effectiveness. TOTAL DOLLAR BENEFIT OF WATER POLLUTION CONTROL,
Syracuse Univ., N.Y. Dept. of Civil Engineering.
Nelson L. Nemerow, and Robert C. Faro.
In: Proceedings, American Society of Civil Engineers, Journal of the Sanitary Engineering Division, Vol 96, No SA3, p 665-674, June 1970. 1 fig, 4 tab, 2 ref.

Descriptors: *Water pollution control, *Benefits, *Beneficial use, *Evaluation, Water quality, Costs, Analytic techniques, Cost-benefit analysis, Water utilization, Waste water disposal, Water supply, Land use, Recreation, Waste water treatment.
Identifiers: In-stream water uses, Willingness to pay.

Tangible dollar benefits of a lake or stream at a given water quality may be estimated by determining all uses which both affect and are affected by water quality, by independently valuing each use, and by summing the resultant values. Measurable beneficial water uses related to water quality include recreational uses, withdrawal water uses, wastewater disposal uses, bordering land uses and in-stream water uses. The value of each beneficial use may be estimated by a 'user willingness to pay' criteria or by an evaluation of benefits derived from avoiding payment. Application of this method to Onondaga Lake at Syracuse, New York, produces an estimated net social benefit of $4,400,000 per yr. Recreation proves to be the most important beneficial use for Onondaga Lake at improved water quality and recreational value comprises close to half of the total net annual benefits of decreased pollution. Estimation of tangible dollar benefits of water pollution control may be useful in the decision of the value of installing advanced forms of waste treatment by river basin firms composed of members representing all major groups in water-using society. LAKE MICHIGAN DEVELOPMENT PROPOSAL.
Northwestern Univ., Evanston, Ill. Dept. of Civil Engineering.

Prepared by the Project in Planning and Design Class, Department of Civil Engineering, The Technological Institue, Northwestern University, Evanston, Illinois, May 1969. 81 p, 9 tab, 32 fig.

Descriptors: *Water quality, *Water supply, *Lake Michigan, *Dike, Earthworkers, Hydraulics, Airport, Water pollution, Bridge construction, Tunnel construction, Highways, Island, Canals, Locks, Costs, Waste dilution, Intakes, Turbidity.

Identifiers: *Lake airport, Artificial island, Sanitary canal, Metropolitan sanitary district, Dike Expressways.

This report presents a proposal for the management of the water quality of Lake Michigan by the construction of a barrier across its southern end. Such a barrier would isolate the largest concentrated area of waste discharges into the lake and prevent further deterioration of the quality of the water in the lake. It would protect the water supplies of the surrounding municipalities by maintaining a consistently high water quality, and would preserve the beaches and shore waters of much of the lake so that Lake Michigan can continue to be a major recreational resource. Three alternative plans are proposed, all of which create a barrier across the lake, but which differ in the extent of development. (See also W71-02157 and W71-02158). (Miller-Chicago)

USE OF NEW ANALYTICAL METHODS FOR WATER RESOURCE DEVELOPMENT,
Texas Univ., Austin. Dept. of Mechanical Engineering.
C. S. Beightler.
Available from NTIS as PB-195 829, $3.00 in paper copy, $0.95 in microfiche. Water Pollution Control Research Series 16110 FZE 09/70, Sept 1970. 13 p. FWQA Program 16110 FZE.

Descriptors: *River basin development, *Optimum development plans, *Dynamic programming reservoir design, Reservoir sites, Mathematical models, Optimization, Computer programs.
Identifiers: Algorithms.

Studies were made to determine the feasibility of applying recently developed analtyical techniques to the problem of planning for optimal water resource development. An optimal plan with regard to the size and location of proposed reservoirs was taken to be that physical configuration which provided the greatest net economic benefit to the people of the region while meeting future water needs. This research was aimed at providing an improvement over the sub-optimal planning techniques of the past which did not take into account the interacting effects which exist between each reservoir and all downstream reservoirs. These interacting effects are actually the predominant characteristics to be considered in the design of a system of reservoirs in any river basin, and cannot be ignored. For the purpose of formulating a mathematical model for this type of problem, a number of recently developed optimization techniques were studied. The best formulation was found to be that which treated the reservoir system design as a branched multistage decision process. In such processes, the decisions made at each stage (potential reservoir site) affect the circumstances under which all subsequent decisions in the system must be made. The intercoupled staging structure of this process was then exploited by means of the nonserial dynamic programming algorithms developed in the course of this research project. These algorithms are effectively decomposition techniques which break down the nonserial (i.e. branched) process into any equivalent serial process that is amendable to solution through ordinary dynamic programming methods. ECONOMICS AND ECOSYSTEMS,
Jon Breslaw.
The Environmental Handbook, Ballantine Book Inc., New York, 1970. p 102-112.

Descriptors: *Environmental effects, *Social aspects, *Natural resources, *Third party effects, Balance of nature, Conservation, Cost-benefit analysis, Environmental ecology, Ecosystem.
Identifiers: *Externalities.

In the American economy the volume of residual waste products is almost as large as the volume of raw materials utilized. The cost system does not make adequate provisision for disposing of waste products, which often pollute the ecosystem and harm third parties. Such adverse effects are classes as externalities. Four corrective approaches are possible. The first is to 'internalize' externalities by enlarging the size of economic decision units. The second is to issue government regulations enforceable by law. The third is closely related to the second. It is to apply the law of nuisance. Methods two and three are our main reliance, but they have serious limitations. Method four involves the impositions of monetary sanctions to help preserve the environment. This can be done either by subsidizing desired courses of action, or by charging for socially harmful action. The latter method seems most advantageous. The policy regarding use of our scarce natural resources such as oil, would be greatly changed by application of the above principles. The costing of pollution effects plus reduced birth rates will be essential to preserving our environment. This article is marked by a good grasp of fundamentals and a very clear non-technical exposition. (Whipple-Rutgers)

DIFCOR - A PROGRAM TO SOLVE NONLINEAR EQUATIONS,
Tennessee Valley Authority, Knoxville.
Roger P. Betson, and Ralph F. Green.
Research Paper No 6, TVA, Div of Water Control Planning, Hydraulic Data Branch, Hydrol Res and Analysis Staff, June 1967. 31 p, 1 tab, 3 append, 3 ref.

Descriptors: *Optimization, *Statistical methods, *Mathematical models, *Computer programs, Regression analysis.
Identifiers: Nonlinear equations, Differential corrections, Principal component analysis.

A Fortran IV program called DIFCOR used to solve nonlinear equations by an optimization procedure termed, 'the method of differential corrections' was described. It was combined with the multivariate statistical technique of 'principal component analysis' used to minimize the sum of squares prediction error and provided a gregression procedure that could be used with virtually any model. With the present dimensions, up to 20 parameters and 300 observations may be analyzed. To use the program package two additional user subroutines were written for each particular problem. The subroutines gave the user considerable latitude in developing mathematical models. The paper documented the program and described what was computed in the user subroutines. (Kriss-Cornell)

OPTIMIZATION BY THE PATTERN SEARCH METHOD,
Tennessee Valley Authority, Knoxville.
Ralph F. Green.
Research Paper No 7, TVA, Div of Water Control Planning, Hydraulic Data Branch, Hydrologic Research and Analysis Staff, Jan 1970. 73 p, 8 fig, 4 tab, 7 ref.

Descriptors: *Optimization, *Mathematical models, *Least squares method, *Computer programs, Linear programming, Hydrologic properties, Rainfall, Flow.
Identifiers: *'Pattern search' method, Response surface, Nonlinear programming.

A method called 'pattern search' which has the ability to reach an optimum solution for a variety of models and data sets was described. It was divised to overcome the inadequacies of earlier methods of optimization and it does so by finding and following a topologic feature of the response surface. The response surface was described as the mapping of the objective function for the range of values of the parameters. A hypothetical response surface was illustrated. The different types of irregularities which adversely affect different optimization techniques for nonlinear models were explained and the 'iterative least squares' technique was discussed. Methods for coping with irregular response surfaces by accelerating the convergence by following a valley to the optimum were listed. Convergence on an acceptable solution is controlled by sensitivity and different types of sensitivity were mentioned. The program described in the report was written in Fortran IV for an IBM System/360 computer. A brief description of the major functions of the main program PATSEAR and its subroutines were given. Illustrations of the various uses of PATSEAR included (1) a linear model used to check the convergence properties of the 'pattern search' technique; (2) two arbitrary objective functions; and (3) two models of hydrologic systems, one a nonlinear function to predict loss from rainfall on a storm-by-storm basis and the other a daily flow prediction model. SYSTEM SIMULATION FOR ANALYSIS AND DESIGN,
Texas A and M Univ., College Station. Dept. of Civil Engineering.
Roy W. Hann, Jr.
Journal of American Water Works Association, Vol 62, No 5, p 279-284, May 1970. 7 p, 7 fig, 14 ref.

Descriptors: *Computer programs, *Hydraulic design, *Systems analysis, Civil engineering, *Programming languages, *Networks, *Simulation analysis, Reservoir operation, Steady flow, Pumps.
Identifiers: HYNET.

Presented in this paper was the basic philosophy and structure of problem oriented languages as they apply to Civil Engineering problem areas in general and the HYNET program in particular which was developed for hydraulic network analysis. The internal structure of HYNET was briefly discussed and the Problem Oriented Language (POL) package, which the author developed to be the heart of a number of problem oriented languages, was presented. The system was imple-

mented on both the IBM 1130 and IBM 360 computers and all system programming was in the Fortran IV computer language so that conversion to other computers was simple. The system described here was primarily the IBM 360 version. The specific capabilities of HYNET were described with regard to 'Usual' network analysis, to pump system balancing and to system simulation under dynamic conditions. The methodology described required the furnishing of reservoir geometry and initial reservoir conditions. An analysis was made via traditional network analysis and the resultant flows considered as steady state flows for some time period. The volumes in the reservoirs were then adjusted accordingly and the resulting new fixed heads between tanks and the new pump heads were calculated. The analysis cycle was then repeated for as many cycles as desired. The commands which were programmed into the present HYNET system were outlined and their use demonstrated in example problems. OPTIMUM DESIGN OF COMPLEX WATER RESOURCE PROJECTS,
Rand Water Board, Johannesburg (South Africa).
David Stephenson.
Proceedings, American Society of Civil Engineers, Journal of the Hydraulics Division, Vol 96, No HY6, p 1229-1246, June 1970. 18 p, 6 fig, 3 tab, 2 append. 5 ref.

Descriptors: *Optimization, *Linear programming, *Mathematical model, *River basins, Constraints, Hydroelectric plants, Reservoir storage, Water distribution (Applied), Draft-storage curves.
Identifiers: Vaal River, Tugel River, South Africa.

This paper concentrated on direct optimization of complex water resources projects, using linear programming and the principle of decomposition of linear programs. The water resources model was of the Vaal and Tugel River basins in South Africa and illustrated the optimum design of multi-interlinked river basins. Each river basin had a number of possible dam sites, some of which were suitable for generation of hydroelectricity. The supply of water to industrial and irrigation areas was considered and a pattern of development yielding maximum net benefit was compiled. Constraints on irrigable area, reservoir capacities urban water requirements and draft from reservoirs were expressed algebraically for formulating the mathematical model. The set of linear constraints on variables was tabulated together with benefit coefficients and linear programming methods used to optimized the system design. Hydroelectric power plant capacity, reservoir capacities and a water distribution pattern were optimized by use of draft-storage-frequency analysis and the resulting draft-storage curves. Descriptors: *Mathematical models, *Equilibrium, *Water allocation (Policy), *Pricing, *River basin, *Optimization, Economics, Physical properties, Water demand, Social needs.
Identifiers: Quadiatic programming model.

The interregional equilibrium models developed by Takayama and Judge may be adapted to determine the efficient allocation and pricing of water in a river basin. The model assumed that a river basin authority acts as the sole public utility distributor of water over time and that the capacity to supply water within any time period may be constrained by the physical structure of the system. The physical structure of a hypothetical river basin was depicted and it was assumed that five regions competed for water stored in a headworks reservoir. The price policy sought for the river basin was that which maximized social welfare in relation to the regulated water supplies. Such a criterion is complex and therefore Marshallion concepts of consumer and producer surplus as an economic approximation to social welfare was used to simplify the approach. Two different types of information were required to test the proposed quadratic programming model; economic data and physical data. Data used pertained to water demand schedules, agricultural, industrial and urban demand for water, assumed transfer and processing costs, and physical characteristics of the water delivery system. Estimated water prices, which maximize social welfare in relation to the water supply to all regions for the four seasons of the year, were listed as well as the quantities of water allocated to each region over the year. Limitations and implications for research from this model were discussed. (Kriss-Cornell)

STOCHASTIC IRRIGATION PLANNING MODELS,
Harvard Univ., Cambridge, Mass. Center for Population Studies.
Douglas V. Smith.
A report to the East Pakistan Land and Water Study, Center for Population Studies, Harvard Univ, Jan 1970. 153 p, 19 fig, 24 tab, 115 ref, 5 append.

Descriptors: *Optimization, *Stochastic processes, *Linear programming, *Mathematical models, *Planning, Irrigation design, Economics, Physical properties, Hydrology, Water allocation (Policy).
Identifiers: Algorithm, East Pakistan.

A series of models and solutions algorithms that considered land and water allocation under stochastic economic and hydrologic conditions were developed. The basic deterministic model emphasizing the interactive consequences of the water demands of potential irrigated lands and the alternative water control possibilities that are present in most situations were discussed. Cropping patterns were selected by the model as well as economic implications of water-balance components which figured prominently in the model's formulation. The basic model was solved using a linear programming algorithm, and post-optimality analysis was performed. Stochastic parameters were introduced into the model and general distribution functions, variable capacities, pricewise linear decision rules, and stochastic demands and supplies were constraints dealt with. A sequence of models was constructed and solved with general conditions in mind and with East Pakistan conditions in mind. The first was deterministic, as a set of decisions for initial investment and yearly operations were determined using exante information. The second employed decision rules expressing canal diversions and well pumpages as linear functions. The final model considered streamflow and precipitation to be stochastic and well pumpages and canal diversions to be responsive to available streamflow as well as to irrigation water requirements. Some suggestions for further research were given. (Kriss-Cornell)

MATHEMATICAL MODELS OF LOCATION: A REVIEW,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
David H. Marks, Charles S. ReVelle, and John C. Liebman.
In: Proceedings, American Society of Civil Engineers, Journal of the Urban Planning and Development Division, Vol 96, No UP1, p 81-93, March 1970. 17 ref.

Descriptors: *Mathematical models, *Model studies, *Analytic techniques, Systems analysis, Operations research, Land use, Planning, Methodology.
Identifiers: *Models of location, Private sector models, Public sector models.

Recent models of location are drawn together and compared as to structure, criteria, and constraints. Private sector models are distinguished as those in which the total cost of transport and facilities is isolated as the objective to be minimized. The solution techniques of six such models are presented. Public sector models are characterized by a criterion function involving a surrogate for social utility and by a constraint on investment in facilities or on the number of facilities. Five models with this format are described and compared. The two types of program, location in the private sector and location in the public sector, are seen to have the same conceptual foundation, but have formats which necessarily differ due to the inability to relate social utility to dollar value. (Miller-Chicago)

For primary bibliographic entry see Field 06B.
W71-02123

SYSTEMS ANALYST'S VIEW OF NOISE AND URBAN PLANNING,
Northwestern Univ., Evanston, Ill. Dept. of Civil Engineering.
Martin Wachs, and Joseph L. Schoffer.
Journal of the Urban Planning and Development Division, Proceeding of the ASCE, Vol 96, No UP2, p 147-159, October 1970. 1 fig, 9 ref.

Descriptors: *Systems analysis, *Analytic techniques, *Planning, City planning, Methodology.
Identifiers: *Noise.

The problem of noise in urban areas is amendable to solution by the control of locational activities or by technological solutions located at the source of noise, at the receiver, or between the source and receiver. Some basic concepts of systems analysis may be used to determine informational requirements to make planning with respect to noise more realistic and more effective. These techniques can be applied to metropolitan water resources management as well. (Davis-Chicago)

SECTION II: WATER QUALITY AND HYDRAULICS.

In: Lake Michigan Development Proposal, Prepared by Project in Planning and Design Class, Department of Civil Engineering, The Technological Institute, Northwestern University, Evanston, Illinois, May 1969, p 4-33. 8 fig, 7 tab.

Descriptors: *Water quality, *Dike, *Sewage, Management, Waste dilution, Treatment, Cities, Intakes, Turbidity, Filtration, Algae.
Identifiers: *Sanitary canal, Metropolitan sanitary district.

The management of the water quality of the lake is looked upon as a complex problem, which can be approached in a number of ways. The emphasis in this part is on the construction of a dike or barrier to isolate the badly polluted southern portion of the lake with discussion of the present pollution problem, the benefits to be accrued with a barrier, construction factors, and the variety of ways it could utilized by the public and private sectors. Also investigated are the possible interrelationships with a proposed new airport on the lake, the Metropolitan Sanitary District, and relationships with urban and industrial areas in Northern Indiana. (See also W71-02156). (Miller-Chicago)
W71-02157

SECTION III: ALTERNATIVE PLANS.

In: Lake Michigan Development Proposal, Prepared by Project in Planning and Design Class, Department of Civil Engineering, The Technological Institute, Northwestern University, Evanston, Illinois, May 1969, p 34-82. 2 tab, 24 fig.

Descriptors: *Water quality, *Hydraulics, *Dike, *Construction materials, *Costs, Lake beds, Supply, Airport, Navigation, Harbors, Recreation, Lake Michigan, Tunneling, Bridges, Solid waste, Islands.
Identifiers: *Lake airport, *Dike expressway, Mass transportation, Monrail.

In this section three alternative plans are discussed, all of which provide a dike for managing the water quality of the lake and which will also provide a large Illinois-Indiana harbor area. These three alternatives present varying degrees of additional benefits and an opportunity for stage construction. The three alternatives are: (1) A minimum dike section; (2) a causeway wide enough to accommodate a highway and rapid transit facilities; and (3) two large islands approximately one-half mile wide at their greatest width. Also, discussed are features typical to all alternatives. The section ends with an over-all summary of the proposal in general. (See also W71-02156). (Miller-Chicago)

6B. Evaluation Process

AN ECONOMIC REAPPRAISAL OF THE TOLEDO BEND MULTIPLE-PURPOSE PROJECT,
Louisiana Water Resources Research Inst., Baton Rouge.
L. H. Falk, and W. J. Stober.
Available from NTIS as PB-195 825, $3.00 in paper copy, $0.95 in microfiche. Louisiana Water Resources Research Institute, Bulletin No 7, Oct 1970. 36 p, 6 tab, 16 ref. OWRR Project A-012-LA (2).

Descriptors: *Cost-benefit analysis, *Multiple-purpose projects, Interstate compacts, Resource allocation, Financing, Hydroelectric power, Taxes, Economics.
Identifiers: *Toledo Bend Reservoir, *Louisiana, *Texas, State taxes, Federal income tax.

Two of the outputs of the Toledo Bend Dam and Reservoir of Louisiana and Texas--hydroelectric power and water supply--could be provided in the private sector. The private costs avoided, therefore, constitute the basic benefits for comparison with the costs of these functions to ascertain economic feasibility. This study examines only the hydroelectric power aspect of the multiple-purpose project. The cost estimates, but not the methods, of the original feasibility study have been used in re-examining project benefits and costs. Benefit-cost ratios are computed from three view-points: (1) that of the power companies purchasing the Toledo Bend output, (2) that of the two states which build the project, and (3) that of the nation as a whole. It is concluded that direct power benefits justify the costs reasonably allocated to power from the standpoint of the power companies and the two states. From the national standpoint, however, the power phase of the project appears unjustified. The bias favoring construction by local interests is a consequence of their ability to shift a portion of the costs to the nation as a whole. The explanation is found in the tax structures and in disparities among discount rates.

THE RELATIONSHIP BETWEEN LAND VALUES AND FLOOD RISK IN THE WABASH RIVER BASIN.
Army Engineer Inst. for Water Resources, Alexandria, Va.

Available from NTIS as AD-704 717, $3.00 in paper copy, $0.95 in microfiche. Army Engineer Institute for Water Resources, 1 WR Report 69-4, December 1969. 117 p.
Identifiers: *Rivers, Floods, *Floods, Economics, Terrain, Production, Agriculture, Protection, Costs, Data processing systems, Selection, Regression analysis, Mathematical models, Programming (Computers), Indiana, Illinois, Ohio, Maps, *Flood risk, Land reclamation, Flood plains, Agricultural economics, *Wabash River, *Flood control.

The report examines the usefulness of using the differential in the value of land of similar productive characteristics on the flood plain and in the upland areas as a measure of the benefits accruing from the provision of flood protection to agricultural areas. A theoretical model is produced and applied to two reaches of the Wabash River and one reach of the White River. The three reaches represent three different topological and flood plain width combinations. The results of the land-value approach are compared with benefit estimates prepared previously using synthetic hydrology. The results of the analysis indicate that while the land-value approach cannot be universally applied there is a considerable range of topological conditions under which the approach offers a viable alternative to current procedures.

COST-EFFECTIVENESS ANALYSIS OF CIVIL ENGINEERING SYSTEMS: NEW YORK CITY'S PRIMARY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
Richard de Neufville.
Massachusetts Institute of Technology, Dep of Civil Eng, April 1970. 26 p, 6 fig, 1 tab, 16 ref.

Descriptors: *Cost-benefit analysis, *Water supply, *Civil engineering, Planning, Design, Public Utilities.

A methodology for cost-effectiveness studies of civil engineering was proposed and illustrated by an example of its application to an urban systems problem. The approached tried to bridge the dichotomy of objectives which often exists between the policy levels of government and the engineering agencies, and which leads to frequent impasses for implementation. This five-stage analysis process attempted to broaden the traditional terms of reference for the design of public works, which are usually governed by engineering standards only tenuously related to the multiple objectives of a facility. A procedure was suggested for the generation of alternative configurations of the system and its components. A means was presented for the ex-

ploration of alternative time-phased strategies of development. A case study of the application of this approach to the planning and design of New York City's Third City Water Supply Tunnel was presented and its lessons were discussed. (Kriss-Cornell)

CHAPTER II: PREPARATION OF REGIONAL, BASIN AND STATE PLANS,
William Whipple, Jr., Ernest A. Englebert, and Warren L. Trock.
In: Evaluation Processes in Water Resources Planning, Urbana, American Water Association, June 14-19, 1970, p 11-25. 17 p, 5 fig, 3 tab.

Descriptors: *Regional development, *Model, *Planning, *State governments, Landscape, Resources, Hydrology, Analysis, Dynamics, Research facilities, Systems, Water resources, Environment, River basin.
Identifiers: *Regional plans, *Basin plans, *State plans, *Devices, *Needs, *Dynamic optimizing models, *Environmental quality, *Regional development, National efficiency, Biological stress analysis, Stress dynamics, System stimulation, Landscape classification system, Landscape values.

In water resources planning, there is a wide range of objectives and alternatives, but practical limitations narrow relations to a few choices. In the North Atlantic Region, consistent with the guidelines issued by the Water Resources Council, three objectives were selected: (1) environmental quality, (2) regional development, and (3) national efficiency. The three objectives could be considered components of practically all the objectives that could reasonably be postulated and three plans can be used to form the basis of a mixed objective plan. Plan formulation is the relating of three components: (1) the needs, (2) the resources, and (3) the devices, which bridge the gap between needs and resources. Two studies are mentioned because of their innovative nature. One is a study of urban growth by the Regional Plans Association of New York, the other deals with visual and cultural values and was conducted by the Research, Planning and Design Associates of Amherst, Massachusetts. The comprehensive State Water Plan for Nebraska is discussed as an example of the types of activities the States, generally, have been encouraged to undertake. Next, the preparation of regional plans is taken up with emphasis on types of research required. Then preparation of State plans is considered with a discussion of the roles of states, and the question of whether or not the conception and practice of planning is truly comprehensive. Following this is a discussion of dynamic optimizing models for comprehensive river basin planning, including state of the art and direction for research. (See also W70-09369) (Miller-Chicago)
W71-02122

CHAPTER III: SYSTEMS ANALYSIS, A SUBSTITUTE FOR PLANNING.

In: Evaluation Processes in Water Resources Planning, Urbana, Illinois: American Water Resources Association, June 14-19, 1970, p 26-40. 15 p, 1 tab.

Descriptors: *Systems analysis, *Planning, *Great Lakes, *Water quality, Limnology, Model, Water resources, Regression analysis, Benefit, State government, Linear programming, Simulation, Optimization.
Identifiers: *Multiple objective problems.

Presently there are several definitions and overlaps in terminology when discussing systems analysis. Here it is defined as a general concept involving the study of a specified portion of the universe. Historically, it had its beginnings in 1953 in water resources. Currently there are three approaches to measure benefits in multiple objective problems: (1) In the table of National Objective Accounts in Water Resources Council's 'Blue Book,' a table emphasizes the comparison of alternative plans in terms of their multiple objective effects; (2) represented by multiple-objective feasible solutions using a transformation curve with different forms of net benefits; together with social indifference (preference) curves; and (3) the depiction of the parties who gain and lose from different project alternatives including all of the significantly affected groups. There are problems in both the application of systems analysis to certain problems and the technique not being used to its greatest effectiveness in water resources planning. Also, there is a gap between the techniques and those who might make use of it. In terms of objectives and restraints in water resource planning, one can contrast what systems analysis can constitute with the actual nature of the water resources problem. Studies in the Great Lakes are given as examples of modeling techniques in water quality problems. Taken up next is systems analysis in State water problems, and some problems of systems analysis in water quality management. Communities want to incorporate environmental quality and efficiency objectives into planning and operations, when there is assurance of benefit to them and means, politically and institutionally, to accomplish this goal. (See also W70-09369) (Miller-Chicago)
W71-02123

CHAPTER IV: OPTIMUM INVESTMENT IN WATER POLLUTION CONTROL.

In: Evaluation Processes in Water Resources Planning (Urbana, Illinois: American Water Resources Association), June 14-19, 1970, p 41-56. 17 p.

Descriptors: *Investment, *Control, *Pollution abatement, *Optimization, Bioassy, Economic feasibility, Social aspects, Analysis, Systems analysis, Biochemical oxygen demand, Model, Conservation, Simulation, Basin, Cost, Federal project policy, Planning, Cities, State governments, Regional analysis, Leadership, Water quality, Effluents, Evaluation.
Identifiers: *Optimum investment, *Gaming, *Simulation gaming, Chicago.

The chapter includes (1) meaning of optimum, (2) our ability to describe and predict physical, chemical and biological effects of pollution control actions, (3) social and economic objectives and constraints, and (4) implementation of solutions. The major question in preplanning is the purpose of river objectives and water's role in social, industrial and economic development. The intangible nature of some objectives makes formal optimization difficult. Modeling data requirements far outstrip data availability and needs adequate monitoring. Systems analysis and computer techniques provide powerful insights into how to analyze optimum investment problems. Applying these techniques meaningfully, capable of providing viable solutions, requires studies into how consumers perceive pollution, plus determining their objectives for a nonmarket collective good. Regional water quality control programs on paper appear more economically efficient than local programs and plants; but most regional programs are not politically acceptable. Then sub-optimum solutions need to be implemented. As to research needs, more questions were generated than answered. Simulation gaming presents a new technique for evaluating political and social values necessary to describe the objectives and constraints for optimization plus devising institutions to implement optimum investment programs. Operational evaluation procedures for determining improved water quality values for instream uses are needed to provide economic inputs for an objective function necessary for optimization analyses and to give the public a quantification of what it receives from investment. (See also W70-09269) (Miller-Chicago)
W71-02134

CHAPTER V, FLOOD PLAIN MANAGEMENT AND FLOOD INSURANCE.

In: Evaluation Processes in Water Resources Planning (Urbana, Illinois: American Water Resources Association), June 14-19, 1970, p 57-73. 17 p, 2 tab, 1 fig.

Descriptors: *Flood insurance, *Flood plains, *Floods, Planning, Zoning, Cities, State government, Federal government, Floodways, Flood protection, Flood proofing.
Identifiers: *Flood plain management, *Flood plain regulation, Actuarial rate.

Site damage may outweigh economic advantages in developing flood plains. Well being and hazard to life must be incorporated into evaluations with environmental considerations. Regulations of flood plains appear to be accepted by government, by contractors, and considered within the urban framework. When done so, management opportunities expand giving rise to possible synergistic effects. Dealing with a flood plain, there are three approaches (1) flood protection, (2) flood plain regulations, and (3) resource planning. An example of insurance encouraging wise use of flood plains, by 31 May 1970 about 150 communities agreed to adopt land use and control measures, to be eligible for federally assisted flood insurance. Insurance promotes control, since rates decrease with installation of control works. The Federal Flood Insurance Program to 31 May 1970, declared 64 communities eligible. By June, 1970, another 100 were to be covered. Flood insurance studies as a basis for actuarial rates are complete for 25 areas. The 1953 Tennessee Valley Authority program for assisting communities in planning for flood damage abatement serves as a model. The new flood insurance program could begin with technological accuracy, but it is not being exploited. Subsidizing on a percentage basis could overcome excessive and unequal subsidies. There is unequal community treatment. In most Tennessee Valley communities small business flood insurance is not available and is a far more serious need than residential insurance. Zoning and insurance may be effective in regard to additional flood plain investment, but offer little to encourage change in existing situations. (See also W70-09369) (Miller-Chicago)
W71-02135

CHAPTER VI: SPECIAL PROBLEMS OF METROPOLITAN WATER RESOURCES ANALYSIS.

In: Evaluation Processes in Water Resources Planning (Urbana, Illinois: American Water Resources Association), June 14-19, p 74-88, 1970. 21 p, 5 fig.

Descriptors: *Metropolitan studies, *Resources, *Analytical techniques, *Return flow, Simulation, Model, Basin.
Identifiers: *Metropolitan water resources management, *Rural water resources management,

*Water as an organizing concept, Muskegon, Michigan.

As attention is focused on metropolitan areas there is a need to develop clear and workable distinctions between metropolitan water resource management and regional or rural water resource management. Then definitions, concenpts, and characteristics of metropolitan resource management are discussed. Considered next is water as an organizing concept. The disadvantages of single-purpose strategies and the power of complex management strategies are compared. In terms of a metropolitan waste management system, there has been a lag in new technology implementation of as much as 50 years between development and widespread application. The Muskegon County, Michigan, wastewater management plan is used as a case example to present methodology for implementing new wastewater management technology in a metropolitan area. An important feature of the Muskegon plan was the community involvement and education program. Water here served as an organizing concept to a great advantage. Taken up next is wastewater irrigation planned through computer simulation. Then water resources planning in urban-metropolitan areas and recommendations for further research are discussed. (See also W70-09369) (Miller-Chicago)
W71-02136

CHAPTER VII: POLITICAL AND INSTITUTIONAL ASPECTS OF THE EVALUATION OF WATER RESOURCE PROGRAMS.

In: Evaluation Processes in Water Resources Planning (Urbana, Illinois: American Water Resources Association), June 14-19, 1970, p 89-100. 11 p.

Descriptors: *Water resources, *Evaluation, *Political aspects, *Institutions, *Decision making, Shores, Legislation.
Identifiers: *Water institutions, *Public actions.

Program evaluation for water resources planning purposes may be defined as the development and weighing of information that bears on the choice among alternative programs. Water institutions were divided into two broad categories: (1) the set of governmental regulations, laws, policies, and programs, influencing the evaluation process of private enterprise; (2) public agencies providing water services, laws, regulations, etc., determining the behavior of these organizations. Attention is focused on private decision making related to shorelands. Most shorelands are privately owned. As a result, the decisions of private entities have an important bearing upon the benefits society derives from its water resources; and, under existing institutional arrangements, shoreland cannot serve the interest of the public. This idea is considered in hypothetical form. Then, in a similar manner, municipalities are considered; and the possibility of governmental intervention to correct deficiencies. Considered next are alternatives for public action. Recommendations for a substantial variety of research are made. Also, noted is the need for further examination of the techniques of cost sharing so as to develop methods of implementing more equitable cost sharing arrangements. (See also W70-09369) (Miller-Chicago)
W71-02137

CHAPTER VIII, MULTIPLE-OBJECTIVE PLANNING, BENEFIT-COST ANALYSIS AND DISCOUNT RATE.

In: Evaluation Processes in Water Resources Planning (Urbana, Illinois: American Water Resources Association), June 14-19, 1970, p 101-118. 20 p, 2 fig.

Descriptors: *Planning, *Cost-benefit analysis, *Discount rate, *National income, *Income analysis, *Interest rate, Basin, Evaluation, Federal government, Environmental effects, Social aspects, Population, Public health, Benefits, Costs, Cost repayment.
Identifiers: *Multiple objective planning, *National economic development, *National income analysis, Task force, Regional development.

Plans for the use of the Nation's land and water resources should be directed to solutions of existing or projected resource needs or problems as identified by the desires of people in such a manner that optimal contributions would be made to society's preferences for national economic development, environmental quality, social well-being, and regional development. Also, the objectives are listed. Then discussion centers on benefits and costs; plan formation, and a proposed procedure for multiple objective planning. The national income concept of benefit-cost analysis is discussed and it is brought out that it provides a valuable service in separating out the components of benefits and costs in the national income framework. Following the discussion of discount rate and interest rate, attention turned to such topics as reimbursement policy; the question of multiple objectives in an economy in which there is a widespread and official commitment to economic growth; and the question of the identification and classification of environmental quality areas. (See also W70-09369) (Miller-Chicago)
W71-02138

CHAPTER IX, EVALUATION OF ENVIRONMENTAL AND REGIONAL EFFECTS.

In: Evaluation Processes in Water Resources Planning (Urbana, Illinois: American Water Resources Association), June 14-19, 1970, p 119-134. 16 p.

Descriptors: *Evaluation, *Environmental effects, *Regional analysis, *Water resources development, *Economic impact, *Surplus water, Planning, Input-output analysis, Preservation, Landscaping, Water resources, Water management, Project planning.
Identifiers: *Environmental quality, Inter-regional competition, Environmental values, Cultural qualities-resources, Visual qualities-resources, Protection needs, Development needs, Wilderness, Ecological research, Environmental quantification, Esthetic classification.

Water resource investments vary in their ability to affect the levels and mix of economic activity and the income results of that economic activity in the investment region and elsewhere in the Nation. An immediate challenge is the level of our understanding of these effects. Distribution of the effects of investments within the region of the investment and between it and elsewhere is more amenable to analysis than past inclusion of such analysis in evaluation reports would indicate. Choice of region and the character of participation in the process by those groups concerned with regional effects would seem to be crucial to the development of acceptable estimates of effects. Evaluation of environmental effects is not as clear as regional effects. Planners need to know who cares about which environmental values and how they will influence the investment decision process. There is a lack of correspondence between the time frame for evaluation of biological systems and the engineering and economic values more familiar to planners. There is a lack of study of methodology. The intergroup conflict process of decision making does not leave the environmental issue to the technician within the agencies. Should water planners seek out and help organize environmentally concerned groups to help plan. New areas of research are needed, especially in regard to the decision making process and esthetic classification and environmental quantification. Discussion of priority areas of research on regional effects was covered last. (See also W70-09369) (Miller-Chicago)
W71-02139

CHAPTER X, DEVELOPMENT OF A RESEARCH PROGRAM ON THE EVALUATION PROCESS.

In: Evaluation Processes in Water Resources Planning Urbana, Illinois: American Water Resources Association, June 14-19, 1970, p 135-150. 16 p.

Descriptors: *Analytical techniques, *Evaluation, Planning, Water resources, Water development, Social needs, Population, Resource allocation, Cost-benefit analysis, Social aspects, Urban sociology.

The political and social climate for water resources planning and development has dramatically changed within the past five years. The Nation is undergoing a reassessment and recordering of national priorities, causing proposed schemes of water utilization and development to be more critically measured relative to other national needs. Based on the shift of political power from rural to urban areas, there has been a shift from resource-oriented water program to population-oriented water programs. The general dissatisfaction with water evaluation processes, particularly cost-benefit analysis, has led to the formation of new government agencies and reformation of others. The technical valuation process for water resources has become a burning political-social issue. The water resource evaluation process is characterized next, and it is indicated that conceptual outlooks, planning, and evaluation approach are substantially altered. Water planning development needs to be placed in a broader societal context so that new policies and strategies can be effective. Water can be an organizing vehicle together with other public functions, such as transportation, for real integration and change. The changes necessary are then discussed. The changes disciplines be brought into the water evaluation process, particual from the behavioral sciences. Then the research needs in the area of water resources evaluation are discussed in terms of objectives, institutions, and market effects. (See also W70-09369) (Miller-Chicago)
W71-02140

COMPUTERS IN FLOOD CONTROL PLANNING,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
L. Douglas James.
Proceedings, American Society of Civil Engineers, Journal of the Hydraulics Division, Vol 95, No. HY5, p 1859-1869, November 1969. 13 ref.

Descriptors: *Flood control, *Planning, *Computers, Optimization, Evaluation, Non-structural alternatives, Analytic techniques, Computer programs, Channel improvement, Land use, Flood-proofing.
Identifiers: *Flood control planning, Structural alternatives.

Federal agencies are required to seek the optimum combination of structural and nonstructural measures for flood control. Most procedures for systematic evaluation of all alternative combinations of structural and nonstructural measures are not feasible under current financial and manpower limitations. The only solution for complete evaluation is by means of the digital computer. Two flood control planning computer programs have been developed which select the optimum combination of channel improvement, flood proofing, and land use management by location within the flood plain and by time. The second program adds detention storage to the list of available alternatives. Both incorporate the entire planning process from the raw data to a selected optimum program of measure use in one run. The programs have been applied to several flood hazard areas in California and Kentucky. (Davis-Chicago)

BASIC CONTEMPORARY URBAN PROBLEMS,
Illinois State Div. of Highways, Springfield.

Felipe V. Derteano.
Journal of the Urban Planning and Development Division, Proceedings of the ASCE, Vol 96, No UP2, p 133-145, October 1970. 13 ref.

Descriptors: *Planning, *Urbanization, *Social aspects, Aesthetics, Ethics, Cities, Community development, Urban sociology, Political aspects, Environment.
Identifiers: *Urban problems.

Urban developments have reached a state that calls for all enlightened persons to take a view, not as passive members of a society that evolves without their particaption, but as interested parties to the actual evolution. What is being observed in the political field has even more significant meanings in the social structure that man has created to lodge his culture. Society is changing, and when this occurs with the intervention of governments at different levels, it is time to see that fate, as never before in history, is in the peoples' hands. Governments are acting; but unless they be better-guided, may end in some complicated and inefficient bureaucratic scheme. Conversely, without aims, society will wind up the target of huge corporations bent only on making large profits in new ventures with government financing. Yet, people must intelligently surrender a misguided individualism and look for more social cohesion, if society is to remain as is. (Davis-Chicago)

Descriptors: *Flood control, *Flood plains, *Flood plain zoning, *Floods, *Hydraulics, Land use, Regulations, Rivers.

Although billions of dollars have been spent for the control of floods, it has been amply demonstrated that, on a nationwide basis, the effort to reduce flood damages is being lost. The flood control program's inability to maintain its early advantage is primarily attributable to rapidly increasing development on flood plains lands. The Tennessee Valley Authority pioneered the comprehensive flood damage prevention concept, portions of which have served as models for later endeavors by various states. Activities by 10 selected states in flood plain identification and management are cited as examples of the concept's past and continuing evolution. Most active state efforts are oriented toward providing adequate identification of flood plains and assisting local entities in implementing appropriate management of designated flood hazard areas. Technical, administrative, and legal problems are noted, as well as similarities to other social and economic needs of society. (Preckwinkle-Chicago)

PLANNING FOR PLEASURE BOATING ON REGIONAL BASIS,
Corps of Engineers, Seattle, Wash.
Ellsworth J. Gullidge, and Frank J. Uraback.
Journal of the Waterways, Harbors and Coastal Engineering Division, ASCE, Vol 96, No WW3, Proc paper 7453, August, 1970, p 583-600. 7 fig, 5 tab, 4 ref.

Descriptors: *Recreation facilities, *Boats, *Marinas, *Channels, *Planning, Navigation.
Identifiers: Moorings, Puget sound, Shipbuilding.

A regional study of Pudget Sound and adjacent waters, in Washington State, provided comprehensive information for use in planning of small boat harbors and other facilities required by pleasure boaters. This study included: an inventory of existing facilities and shoreline; measurement of marine facility demand by a questionnaire survey; comparison of demand with existing facilities to determine needs for additional facilities and projections of needs to 1980, 2000 and 2020. The paper displays a systematic approach towards the measurement of boater demand, both of quality and quantity, thus providing techniques for use by planners seeking to plan and develop facilities for pleasure boating. STORM WATER FOR FUN AND PROFIT,
Chicago Univ., Ill. Center for Urban Studies.
John R. Sheaffer.
Water Spectrum, Vol 2, No 3, p 29-34, Fall 1970. 7 fig, 1 tab.

Descriptors: *Storm runoff, *Planning, *Environmental engineering, *Multiple-purpose projects, *Benefits, *Water supply, *Recreation, *Flood protection, Detention reservoirs, Retention, Storm water, Groundwater.
Identifiers: *Metropolitan resource management, *Closed systems planning, *Potential resources, *Open space.

A conceptual framework for storm-water management is presented illustrating in several case studies opportunites to capitalize upon a wide range of benefits. The three basic principles in the framework are: (1) the environment is a single unit with air, land, water and urban development interacting; (2) the earth for planning purposes is a closed system; (3) storm water is a potential resource out of place. The unity of the environment places storm water in a comprehensive perspective. Interchanges between surface and groundwaters and effects of urban land uses on distribution and quality must be recognized so that external costs will not affect drainage benefits. Considered within a closed system, the problem becomes one of space allocation. And viewed as a resource, location becomes an important factor. It is simply improper location that makes storm water a problem. When viewing storm water as a resource, quality must be carefully considered, particularly the initial flush which has been shown to be highly polluted. Therefore, a distinction must be made between detention and retention reservoir. When storm water is to be retained, it must be in an unpolluted condition or given treatment before storage. The six case studies discussed are: Storm water management at the Flick-Reedy plant in Bensensville, Illinois; Leetsdale-Oneida Apartment development at Denver; Howard Gulch flood control project in Denver; Skyline urban renewal project in Denver; Marcy Forest View Apartment development in Arlington Heights, Illinois; and the Indian Lakes storm drainage design in Bloomingdale, Illinois. All six cases illustrate in varying degrees the synergistic benefits of water supply, flood damage reduction, recreation, and open space. (Preckwinkle-Chicago)

COMMUNITY DECISION STRUCTURE AND URBAN PLANNING PROCESS,
Bureau of Public Roads, Washington, D.C.
Thomas J. Hillegass, Charles C. Schimpeler, and William F. Grecco.
Journal of the Urban and Development Division, Proceedings of the American Society of Civil Engineers, Vol 96, No UP1, p 17-22, March 1970. 1 tab, 9 ref.

Descriptors: *Planning, *Methodology, *City planning, *Decision making, Community development, Urban sociology, Political aspects, Social aspects, Attitudes, Social values.
Identifiers: *Community influentials, Community goals, Community objectives.

Professionals must be able to identify the power structure in a given community. If influential people are involved in the initial formulation of goals and objectives reflecting the broadly based value systems of the community, these same people will make the decisions, public and private, essential to implementing the adopted comprehensive urban plan. Community influence patterns are diverse and vary, in point in time, area of community interest as to whether influence is overt and direct, or indirect. Political scientists propose several means of identifying influential persons. These are position potential, issue examination, reputional technique, and social participation. A criterion for the selection of a committee to formulate community goals and objectives in a manner consistent with a broadly based community value system considers that the committee should consist of direct and indirect influentials, including public officials and representatives of commerce and industry, who are directly influential in controlling development decisions; and those indirect influentials who by reason of their personal stature and demonstrated interest are effective in shaping policies on important community issues. URBAN PLANNING AND DEVELOPMENT OF RIVER CITIES,
Vollmer Associates, New York.
Arnold H. Vollmer.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol 96, No UP1, p 59-64, March 1970.

Descriptors: *Planning, *Cities, *Rivers, *City planning, Navigable waters, Conservation, Land use, Water pollution, Recreation.
Identifiers: *River cities, Metropolitan areas, Waterfronts.

The past provides a wealth of information testifying to the undeniable importance of locating cities on navigable bodies of water for purposes of trade, transportation, and protection. However, our present life style does not demand this same situation in order to grow and economically prosper. As man has evolved, so has his relationship to his environment, in this case his relationship to the waterfront. While the absolute necessity of waterfront location has become absolete, the sites themselves have become unsightly and neglected. Waterfronts, once the pride of the cities, have in many instances become the scars of the cities. As the demands for rivers as transportation and trade routes diminished, new demands evolved. The river became the transporter of sewage, the refuge of the pleasure seeker. The new demands often conflict with one another, yet they are of equal importance. While man's relationship to the waterfront is constantly evolving, function and esthetics are still key words in planning considerations. The aim must be progress in river city planning which will meet these demands and allow for order and meaning within the changing relationship between the river and the city. (David-Chicago)

THE STATE OF THE ART OF PLANNING,
Bartholomew (Harland) and Associates, Memphis, Tenn.
William S. Pollard, and Daniel W. Moore.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol 95, No UP1, p 27-42, April 1969. 7 fig, 10 ref.

Descriptors: *Planning, *Methodology, Systems analysis, Decision-making, Environment, Social aspects, City planning.
Identifiers: *Policy, *Inter-disciplinary teams, *Research, Operations research, Applied research.

The paper is based on a planning philosophy which attempts to deal with the total environment: social, economic, and physical. It describes the complex interrelationships among the many professions, so-

cial groups, and organizations involved in planning and suggests that an approach involving systems analysis and multi-disciplinary teams is required. Current planning practice is analyzed by means of a matrix which relates 43 kinds of planning studies with 28 technical steps required for their successful completion. The need for better techniques is emphasized for evaluating planning performance and to present a method for devising such techniques. Planning decisions are postulated and solutions to planning problems are sought mainly through one of the following approaches: (1) Policy; (2) judgement; (3) analysis and judgement; (4) operations research; and (5) applied research. ACCESSIBILITY AND ENVIRONMENTAL QUALITY,
British Columbia Univ., Vancouver. School of Community and Regional Planning.
V. Setty Pendakur, and G. R. Brown.
Journal of the Urban Planning and Development Division, Proceedings of the American Society of Civil Engineers, Vol 95, No UP1, p 43-59, April 1969. 4 fig, 3 tab, 15 ref.

Descriptors: *Planning, *Environment, *Attitudes, Systems analysis, Social values.
Identifiers: *Environmental quality, *Accessibility.

A technique is outlined which could be of use in metropolitan water resources management, especially in the investigation of conflicting uses of the water resource. A systems framework is developed which portrays the components of the conflict between environmental quality and accessibility. Elements which serve to measure pedestrian safety, comfort, convenience and visual sensation are compared with those measuring motor vehicle driver safety, convenience, penetration and visual harmony. A pilot study was made, and pedestrian interviews conducted in an attempt to analyze perceptual responses to the environment. Two conclusions emerged from the study: (1) That it is possible to measure the environmental quality-accessibility conflict by attitude survey; and (2) that people are more consciously aware of problems of accessibility than of those of environmental quality. GUIDELINES FOR ESTABLISHING ECONOMIC AND ENGINEERING FLOOD CRITERIA,
Washington Univ., Seattle; and Washington State Univ., Pullman.
P. W. Barkley, D. L. Bender, H. D. Copp, J. G. Hattersley, and J. F. Osborn.
Commentary on Improving the Flood-Associated Activities of the State of Washington Dep of Water Resources Olympia, Report No 4, Part A, State of Wash. Water Research Center, Pullman, June 1970. 103 p, 18 fig, 8 tab, 2 append.

Descriptors: *Flood control, *Cost-benefit analysis, *Economics, *Flood damage, Hydrologic aspect, State jurisdiction, Washington.

The study described was designed to establish criteria for determining what portion of the costs for a flood control project for the State of Washington should be supported with State funds. Guidelines for establishing criteria to meet the needs of specific projects were described for flexibility and efficiency. An evaluation of past flood control activities by the State was provided. Recommendations were made to improve the efficiency of future flood damage alleviation activities. These recommendations included: (1) development of a state-wide, master policy and plan for flood damage alleviation; (2) initiation of a dynamic public information program on flood plain management; (3) approval of only local benefit projects; (4) requirement of more detailed information for entities requesting funds for flood projects; (5) enactment of zoning and land-use regulations governing the flood plain for counties and cities with flood problems; and (6) procedures for objective review of all projects. The recommendations were made on the basis of eighteen months of study. A brief history of the flood control division, flood damage reduction programs in other states, alternatives to the structural approach to flood damage reduction, the availability of hydrologic information and flood plain information studies and economic guidlines for evaluating project proposals and determining the level of state support were the topics discussed. THE ALLOCATION AND PRICING OF WATER IN A RIVER BASIN,
Guelph Univ. (Ontario); and University of New England, Armidale (Australia).
J. C. Flinn, and J. W. B. Guise.
American Journal of Agricultural Economics, Vol 52, No 3, Aug 1970, p 411-421. 35 ref, 3 tab.

Descriptors: *Water allocation (Policy), Operating costs, Water rates, Equilibrium prices, Mathematical model, Cost analysis, Analytical techniques.
Identifiers: *Yanco Irrigation Area, Murrumbidgee Irrigation Area, New South Wales, Australia.

A spatio-temporal equilibrium model that incorporates intraseasonal demands for irrigation water is developed for the situation with a (constrained) competitive market for water. An application of the quadratic programming model, which utilizes demand and supply estimates relating to an intensive irrigation area in Southeastern Australia, is used to derive optimal short-run allocation and pricing patterns for the resource. Extensions of the model to cover multiple dam river basins and additional water uses seem conceptually straightforward, but the limitations imposed by its deterministic partial equilibrium character should be recognized. 6D. Water Demand

PRICE, DEMAND, COST, AND REVENUE IN URBAN WATER UTILITIES.
Hittman Associates, Inc., Columbia, Md.

Available from the NTIS as PB-195 929, $3.00 in paper copy, $0.95 in microfiche. Hittman Associates, Inc Report HIT-474, September 1970. 106 p, 18 tab, 3 fig, 51 ref, 2 append. OWRR Project C-1790 (3168) (1).

Descriptors: *Water demand, *Water costs, *Water rates, *Elasticity of demand, *Economic evaluation, *Statistical models, Municipal water, Cost allocation, Public utilities, Regression analysis, Operating cost, Michigan.
Identifiers: *Rate-making policy, Detroit (Mich), Roseville (Mich).

The effects of rate-making policy on urban water utilities were investigated, including relationships between price, demand, cost, and revenue. The findings of other investigators were reviewed and analyzed, particularly estimates of the price elasticity of municipal water demands. Data were collected directly from 46 urban water utilities. Statistical methods were used to develop functional expressions for mean, maximum day, and peak hour demand; operating cost; and various classes of revenue. These functional expressions were incorporated into a general economic model of urban water utilities. Two case studies were performed using the economic model, based on data from Detroit and Roseville, Michigan. The case studies were used to illustrate the effect of a postulated rate increase on demand, cost, and revenue. Other applications of the economic model are described, including investigations of the distribution of demand, cost, and revenue among various classes of water users under alternate pricing strategies. Functional expressions for water demands were found to agree closely with those developed by other investigators. Operating cost functions and revenue functions incorporate correlations not previously reported. (Boland-Hittman)

YOUNG V SCOTT (LIABILITY FOR OBSTRUCTION OF FLOW OF SURFACE WATER FROM DOMINANT ESTATE).

250 NW 484-486 (Iowa 1933).

Descriptors: *Iowa, *Dikes, *Diversion structures, *Surface runoff, Watersheds (Divides), Legal aspects, Judicial decisions, Remedies, Damages, Drainage, Drainage water, Riddance (Legal aspects), Concrete structures, Relative rights, Over-lying proprietor, Surface drainage, Obstruction to flow, Surface waters.

Plaintiff dominant estate owner sought an injunction to compel defendant servient estate owner to remove a dike which ran along the boundary line between their two tracts of land. Plaintiff contended that a dominant estate owner had a right to the unobstructed natural flow of drainage water from his land. Defendant contended that the dike had been in existence for forty years pursuant to an oral agreement between the parties. The Supreme Court of Iowa held that while it is well settled law that a dominant estate owner has a right to the unobstructed natural flow of drainage water from his land onto a servient estate, that right was overcome in the instant case upon sufficient proof of an oral agreement to erect a dike to drain the surface water in another manner. The trial court's judgment for defendant was affirmed. (Quesada-Florida)

A STUDY OF VARIOUS PROCEDURES UTILIZED BY SELECTED WATER-ORIENTED SPECIAL DISTRICTS WHICH ARE COMMON TO ALL OF THEM,
Washington Univ., Seattle. School of Law.
Beverly J. Rosenow.
Available from NTIS as PB-195 828, $3.00 in paper copy, $0.95 in microfiche. Completion Report. Resources Research Project No. A-030, Washington State University. 157 p, 8 charts, 3 append. OWRR Project A-030-WASH (1).

Descriptors: *Water-oriented special districts, *Commercial waterway districts, *Diking districts, *Flood control districts, *Flood control zone districts, Intercounty diking, Rehabilitation districts, *Public waterway districts, Governing bodies, Elections, Voter qualifications, Consolidation procedures, Reorganization procedures, Merger procedures, Dis-solution procedures. Uniform procedures act.
Identifiers: *Drainage districts, Drainage, *Water districts, Diking, *Sewage districts, Flood control, *Investigation districts, Public utility districts, Legislation, Water rights, Public rights.

This study analyzes selected common procedures prescribed by statute for several water-oriented special districts authorized in the State of Washington. Extensive differences were found in the procedures studies (formation, governing bodies, elections, consolidation, merger, reorganization, and dissolution). These differences are discussed in the text and reflected in accompanying comparative charts which summarize the governing statutes. It is concluded that development of uniform procedures in these areas is feasible. However, recommended as a better approach is creation of a single type of overall water management district authorized to carry out all of the water resource functions now spread among the man types of special districts with some jurisdiction in this area. Formation of a special commission to consider the feasibility of developing such broad legislation is suggested. In the course of gathering and anlyzing the special districts materials noted in this study, it was found that many efforts are being made to improve the structure of special district governments and that much more needs to be done to make the administration and operations of such districts more responsive and efficient. Suggestions are made for establishing a central record-keeping operation for all special districts presently existing in the state and for formation of a special districts association. Repeal of the never-utilized public waterway district legislation is recommended. (Rosenow-Washington)
W71-01657

MILLER V ZAHN (DOMINANT ESTATE'S LIABILITY FOR COLLECTION AND DISCHARGE OF SURFACE RUNOFF).

264 Mich 306, 249 NW 862 (1933).

Descriptors: *Michigan, *Drainage water, *Surface runoff, *Riddance (Legal aspects), Damages, Drainage systems, Concrete structures, Water management (Applied), Remedies, Legal aspects, Judicial decisions, Drains, Tiles, Tile drains, Impoundments, Impounded water, Land management.

Plaintiff servient estate owner sought to enjoin defendant dominant estate owner from collecting surface runoff and pouring it through an artificial ditch and tile drain onto plaintiff's servient estate. Plaintiff also sought to collect damages for water injury to his land. While conceding that a dominant estate owner had a right to have natural surface runoff flow onto the servient estate, plaintiff contended that this right could not be abused by increasing the burden on the servient estate through artificial collection and riddance. Defendant contended that the damage was due to an unusually heavy rainfall and denied that it was the product of the articial system employed by him. The Supreme Court of Michigan held that a dominant estate owner cannot, by collecting and concentrating the surface waters, abuse his lawful right to natural surface runoff. (Quesada-Fla)
W71-01661

BYRAM V LAWEIN (DISCHARGE OF SEWAGE WATER ONTO ANOTHER'S LAND).
232 NW 907-909 (SD 1930).

Descriptors: *South Dakota, *Sewage, *Riddance (Legal aspects), *Discharge (Water), Surface water, Septic tanks, Surface runoff, Surface drainage, Watercourses (Legal), Right-of-way, Railroads, Sewers, Land tenure, Culverts, Water pollution, Sewage disposal, Odor, Legal aspects, Judicial decisions, Wastes, Waste disposal, Overflow.

Plaintiffs sought to enjoin defendant from maintaining a septic tank near defendant's businesses and from discharging the overflow water from the tank onto plaintiffs' right-of-way. Plaintiffs proceeded upon two theories: (1) that the overflow from defendant's septic tank constituted a public nuisance; and (2) that defendant had no right to discharge water of any character upon plaintiff's land. The trial court denied the injunction. The South Dakota supreme court reversed. Plaintiffs were correct in their contention that defendant had no right to drain any water, other than the natural surface water, onto plaintiffs' right-of-way. The fact that defendant's discharge was minimal in quality and that the damage was also minimal did not authorized refusal of the injunction where the trespass was a continuing one. (Duss-Fla)
W71-01667

GREENFIELD V POWELL (TITLE TO ACCRETED PROPERTY).
118 So 556-559 (Ala 1928).

Descriptors: *Alabama, *Boundary disputes, *Boundaries (Property), *Accretion (Legal aspects), Streamflow, Real property, Land, Legal aspects, Judicial decisions, Stream erosion, Streams, Bank erosion, Running waters, Land tenure, Channels, Non-navigable waters, Relative rights.

Plaintiff and defendant owned property separated by a non-navigable stream. The course of the stream changed over a period of time, decreasing the area of plaintiff's property as bounded by the stream. Defendant claimed title to the property, which was previously plaintiff's, as accretion to his land. Plaintiff claimed the description in defendant's deed limited his property to a certain section of land, and that insofar as the allegedly accreted property extended over the section line, it was not defendant's. The Supreme Court of Alabama reversed a judgment for Plaintiff, finding that the stream in question changed course in a gradual manner consistent with accretion. Where a non-navigable stream is the boundary between adjacent landowners, each owner takes to the thread of the stream. Grants limited to a specific section of land may not by accretion be extended into another section, but the court found in the instant case that the description in defendant's deed did not limit his property to any specific section. (Dye-Fla)
W71-01668

STATE V TIMOTHY (DOCTRINE OF PURPRESTURE LIMITS PRIVATE CONSTRUCTION ON LAKE BED).
166 La 738, 117 So 812-814 (1928).

Descriptors: *Louisiana, *Ownership of beds, *Public rights, *Lake beds, Legal aspects, Judicial decisions, Remedies, State governments, Legislation, Lakes, Recreation facilities, Navigable waters, Engineering structures, Structures, Water rights, Social aspects, State jurisdiction, Regulation, Remedies.
Identifiers: *Purpresture.

Plaintiff state sued to require defendant to demolish a two-story bathhouse he had constructed 300 feet from shore on the bed of a state-owned lake. Defendant operated the bathhouse as a private business. Plaintiff argued that the common law doctrine of purpresture applied. Defendant contended the doctrine was limited to public things whose title is vested in the state, but not 'common things' which belong to no one, and which all men may use. The Supreme Court of Louisiana, in affirming a lower court decision for plaintiff, held that defendant could not invoke the statutory 'common things' protection because even if the lake bed were a common thing the permanent bathhouse was not a natural use contemplated by the statute. Since title to the lake bed rests in the state, it may sue to abate a purpresture or eject a trespasser on the public domain. (Morris-Florida)
W71-01673

GEISERT V CHICAGO R I AND P RY (SERVIENT LANDS MUST SUFFER CONSEQUENCES OF UNRESTRAINED FLOW OF DRAINAGE FROM DOMINANT ESTATES).

42 SW2d 954-957 (Mo 1931).

Descriptors: *Missouri, *Drainage practices, *Bridges, *Natural flow doctrine, Diversion structures, Damages, Ditches, Levees, Embankments, Drainage, Drain water, Culverts Natural streams,

Natural flow, Overflow, Missouri River, Land reclamation, Drainage districts, Sediment distribution, Accretion (Legal aspects), Alluvium, Excavation, Railroads, Judicial decisions, Legal aspects.

Plaintiffs landowner and corporation sought damages for injuries sustained allegedly as a result of defendant railroad's construction of a bridge over a creek and defendant landowner's digging of a ditch alleged to have altered the flow of the creek and increased the flow thereof onto plaintiffs' property. The court held that although one who diverts a watercourse from its natural channel must answer for damages, the alteration of the flow of the creek in the instant case was from natural causes. The court held further that defendant railroad had acted properly by constructing the bridge and allowing the water in its natural course to flow therethrough and that plaintiffs, as servient owners, had to suffer the consequences of the unrestrained flow of drainage onto their lands from dominant lands. The trial court's judgment for defendants was affirmed. (Price-Florida)
W71-01674

BOEHM V WERMUTH (DIVERSION OF STREAM FROM LANDOWNER'S PROPERTY).
215 NW 818-819 (Wis 1927).

Descriptors: *Wisconsin, *Streams, *Diversion structures, *Adjudication procedure, Alteration of flow, Natural flow doctrine, Obstruction to flow, Reasonable use, Relative rights, Water spreading, Judicial decisions, Legal aspects, Diversion.

Plaintiff riparian landowner sought a mandatory injunction against defendant upper riparian landowner. A stream divided into two courses on defendant's property, one course passing through plaintiff's tract. Plaintiff had obstructed the stream at this 'Y' division prior to defendant's purchase of his property, thereby diverting all the water through his land. After defendant's purchase, a flood washed this obstruction away, rediverting the stream back into the other course away from plaintiff's property. Defendant refused to permit plaintiff to enter upon his property to rebuild the obstruction, and plaintiff brought this action. Plaintiff contended that the trial court's fact findings were erroneous. Reviewing the evidence, the court affirmed the findings of the lower court, agreeing that defendant had no obligation to permit plaintiff to enter his property. (Hart-Florida)
W71-01677

EHLER V STIER (NULLIFICATION OF EASEMENT FOR DRAINAGE OF SURFACE WATER).
216 NW 637-639 (Iowa 1927).

Descriptors: *Iowa, *Surface drainage, *Easements, *Surface waters, Natural flow doctrine, Cities, Drainage systems, Flooding, Flood damage, Riddance (Legal aspects), Surface runoff, Drainage practices, Ditches, Water conveyance, Culverts, Roads, Judicial decisions, Legal aspects, Prescriptive rights, Relative rights.

Plaintiff landowner sought to enjoin defendant township from maintaining a culvert which drained surface water onto his property. Plaintiff's land and an adjoining owner's upper tract were separated by a road. Surface water drained from the upper tract through the culvert in the road and flooded plaintiff's land. Plaintiff's predecessor in title had obtained a permanent injunction prohibiting installation of the culvert, but a later predecessor had agreed orally with the adjoining landowner to ditch the road and to allow defendant to install the culvert. Plaintiff contended that the injunction prohibitied the ditches and culverts, while defendant alleged that a permanent drainage easement was created by plaintiff's predecessor, and that plaintiff received his property thus burdened. The court noted that if the drainage easement was permanent, it could not be nullified except by mutual consent. The previous owner's agreement was held to create a permanent easement which burdened plaintiff's estate at his purchase. The court summarily rejected plaintiff's assertion that the culvert size was restricted by the injunction, and affirmed the lower court's decision for defendant. (Hart-Florida)
W71-01682

SANDERS V DE ROSE (INJUNCTION TO PREVENT TRESPASSING UPON A PRIVATE LAKE).
191 NE 331-334 (Ind 1934).

Descriptors: *Indiana, *Lakes, *Ownership of beds, *Fishing, Sport fishing, Farm ponds, Recreation, Boundaries (Property), Water utilization, Competing uses, Nonconsumptive use, Legal aspects, Judicial decisions, Land tenure.

Plaintiff lake owner sought to enjoin defendant citizen from fishing and trespassing upon his lake. The lake, non-navigable and unconnected with navigable waters, lay almost wholly within plaintiff's boundary, except for a small portion lying within the adjoining private tract. Plaintiff operated a fishing camp on the lake. Defendant entered the lake with permission of the adjoining landowner, and refused to depart at plaintiff's request, asserting to plaintiff's customers that plaintiff did not own the waters of the lake above plaintiff's lake bed and could not charge them to fish in the lake. Plaintiff claimed control of the lake bed. The court noted that since plaintiff's lake-bed boundary was fixed by congressional survey, it was as certain as plaintiff's upland boundary. The common law was held to apply. Plaintiff had the right to unmolested use and control of his portion of the lake bed and the water thereover. Plaintiff's requested injunction was granted. (Hart-Florida)
W71-01685

VILLAGE OF ORRVILLE V GOCHNAUER (MEASURE OF DAMAGES FOR STREAM POLLUTION).
183 NE 391-393 (Ohio 1932).

Descriptors: *Ohio, *Water pollution, *Damages, *Compensation, Cities, Water pollution sources, Water pollution effects, Judicial decisions, Legal aspects, Adjudication procedure, Streams, Farms, Crops, Agriculture, Odor, Potable water, Cattle, Domestic animals, Poultry, Rent.
Identifiers: Orriville (Ohio).

Plaintiff farm owner sued defendant village for damages caused by pollution injury. Verdict and judgment were rendered for plaintiff. On appeal, defendant charged that the trial court had erred in failing to grant a judgment n.o.v. Defendant had queried the jury for special findings and had elicited a reply that rental value was not considered in reaching the verdict. To another question, the jury replied that the amount of damages awarded for foul odors from the polluted creek were $250. Defendant contended that these findings were inconsistent since the damages from odor could properly be established only by considering rental value. Furthermore, since the court had charged the jury that the measure of damages was the diminution in rental value, defendant asserted that the jury had failed to follow the court's instructions. After stating that a clear and irreconcilable conflict was required to overturn the verdict, the court held that such a conflict did not exist in the instant case. The court went on to hold that the questions of special findings were improper, and affirmed the lower court's decision for plaintiff. (Hart-Florida)
W71-01691

LYON V WATER COMM'RS OF CITY OF BINGHAMTON (RIGHT OF RIPARIAN OWNER TO FULL FLOW OF STREAM).

228 App Div 585, 240 NYS 647-654 (1930).

Descriptors: *New York, *Diversion, *Riparian rights, *Water demand, Prescriptive rights, Cities, Riparian land, Riparian waters, Diversion losses, Dams, Wells, Legislation, Judicial decisions, Legal aspects, Mills, Mill dams, Reservoirs, Water storage, Water supply, Damages, Remedies, Municipal water, Relative rights.

Plaintiff riparian owner and dam operators sought to enjoin defendant city from diverting water from the river above plaintiffs' dam. Plaintiffs' predecessor in title had legislatively secured the right to operate the mill dam on the river. Defendant had diverted the water because it was the only source of water for the city, and claimed a prescriptive right to such water diversion. The court ruled that plaintiffs, as riparian owners, had the right to enjoy the full flow of the stream. By wrongfully diverting the water, the city had gained no prescriptive rights thereto. However, since plaintiffs suffered no substantial damages, and since the river was the only source of supply for city water, the lower court's injunction against defendant was suspended until such time as plaintiffs suffered substantial damage. An award of nominal damages preserved plaintiffs' title and prevented defendant's securing prescriptive rights. (Price-Florida)

HAMMOND V ANTWERP LIGHT AND POWER CO (LIMITATIONS ON PRESCRIPTIVE RIGHT TO DIVERT STREAM FLOW).
132 Misc Rep 786, 230 NYS 621-639 (1928).

Descriptors: *New York, *Water utilization, *Prescriptive rights, *Water levels, Diversion dams, Relative rights, Riparian rights, Reservoirs, Lakes, Navigable waters, Diversion structures, Reasonable use, Prior appropriation, Damages, Remedies, Legal aspects, Judicial decisions, Consumptive use, Artificial use, Legislation.

Plaintiff lower riparian landowners sought to enjoin defendant power company from drawing water from its dam at the head of the stream upon which plaintiffs' lands abutted. Defendant maintained a dam at the mouth of the lake from which the stream flowed. Plaintiffs contended that while defendant might have acquired a prescriptive right to dam the water flowing from the lake outlet, it was restricted in the amount, manner, and purpose of such withdrawal. Plaintiffs further contended that defendant had not established a prescriptive right to diminish the flow onto the stream flowing through plaintiffs' lands. Defendant contended that it had acquired a prescriptive right both to dam the flow and to use the water for whatever purposes it chose. Additionally, defendant denied that it had impaired the flow onto plaintiffs' lands. The court held that when an upper riparian owner acquires the right to raise the water level to a certain height, other riparian owners acquire a reciprocal easement to have the water maintained at that height and used for the same purposes. (Quesada-Florida)
W71-01693

KNAUTH V ERIE RR (ACQUISITION OF PRESCRIPTIVE RIGHT TO DIVERT WATER).
219 App Div 83, 219 NYS 206-212 (1926).

Descriptors: *New York, *Streamflow, *Diversion, *Prescriptive rights, Relative rights, Riparian rights, Artificial use, Consumptive use, Water utilization, Diversion dams, Damages, Remedies, Legal aspects, Judicial decisions, Structures, Prior appropriation, Water levels, Adjudication procedure, Water demand.

Plaintiff lower riparian landowner sought to enjoin defendant upper riparian railroad from diverting water to the extent of depriving him of sufficient water to operate his mill. Plaintiff contended that he had forcibly removed defendant's dam before the passing of the required statutory period for defendant to establish a prescriptive right. Furthermore, plaintiff maintained that defendant had the burden of proving a prescriptive right to draw the

amount of water it was drawing at the time of the action. Defendant contended that it had so established a prescriptive right by reason of having diverted water without interruption for the statutory period. The court held that while a prescriptive right to divert the water of a stream may be acquired by uninterrupted diversion for the statutory period, defendant had the burden of proving such right by indubitable proof. Moreover, the court held that in order to establish a prescriptive right, there must have been appreciable diminution in the natural flow of the stream to the injury of the lower riparian owner from the beginning of the statutory period. The court held that defendant had not established a prescriptive right and affirmed the trial court's judgment for plaintiff. (Quesada-Florida)

STEVENS HOTEL CO V CHICAGO YACHT CLUB (ERECTION OF BUILDING AS BURDEN ON SCENIC EASEMENT).
399 Ill App 463, 171 NE 550-554 (1930).

Descriptors: *Illinois, *Scenic easements, *Riparian rights, *Lake Michigan, Lakes, Cities, Roads, Riparian waters, Buildings, Landfills, Easements, Judicial decisions, Legal aspects, Parks, Aesthetics, Land use, Scenery, Relative rights.
Identifiers: Chicago (Ill).

Plaintiff hotel owner sought to enjoin defendant yacht club from erecting a building on the shore of Lake Michigan. Plaintiff's hotel was situated on an avenue along Lake Michigan; a park extended to the lakeshore on the opposite side of the avenue. Plaintiff had an easement appurtenant in the park which prevented erection of buildings there. The city dredged in the lake bed adjacent to the park to a harbor line established by the Secretary of War. Defendant proposed to erect a clubhouse on land dredged in outside of this harbor line. Plaintiff contended that erection of the clubhouse would burden his easement. The court determined that plaintiff's easement extended throughout the dredged in portion of the park, as well as in the original park. However, the court found that plaintiff had no riparian rights other than those of the general public. Since the proposed site was beyond the harbor line to which plaintiff's easement extended, the court held that the easement would not be burdened by the new clubhouse, and affirmed the lower court's decision for defendant. (Hart-Florida)
W71-01724

NORTH-EAST COAL CO V HAYES (LIABILITY FOR DAMAGES TO FARM BY COAL MINE).

244 Ky 639, 51 SW2d 960-963 (1932).

Descriptors: *Kentucky, *Coal mines, *Damages, *Water pollution, Coal mine wastes, Water pollution sources, Hydraulic mining, Pollutants, Water pollution effects, Compensation, Reasonable use, Wells, Streams, Flooding, Soaking, Flood damage, Drainage systems, Judicial decisions, Legal aspects, Adjudication procedure, Farms, Property values.

Plaintiff landowner sued defendant coal mining company for damages caused by defendant's mining operation. Defendant, who owned the mineral rights to plaintiff's land, had allegedly caused three injuries to plaintiff: (1) an inadequate drain pipe caused water to run onto plaintiff's bottom land; (2) waste mining water polluted a creek which ran through plaintiff's property; and (3) plaintiff's well was contaminated. The court held defendant liable for injury from the inadequate drain. However, defendant was held not liable for the well pollution since the source of the pollution was underground, and therefore it could not have been avoided with reasonable care. As to the stream pollution, the court stated that if it could have been prevented by reasonable care, defendant was liable and remanded the issue for a new trial. The court determined that the measure of damages for temporary injury was the diminution in rental value, whereas the measure for permanent injury was the dinimution in fair market value. (Hart-Fla)
W71-01733

LOUISVILLE AND N RR V SALTZER (RAILROAD'S LIABILITY FOR BANK EROSION CAUSED BY REROUTING OF RIVER).
144 SE 456-458 (Va 1928).

Descriptors: *Virginia, *Railroads, *Rivers, *Bank erosion, Banks, Streamflow, Alteration of flow, Routing, Damages, Riparian land, Riparian waters, Erosion, Channel erosion, Construction, Diversion, River training, Judicial decisions, Legal aspects, Adjudication procedure.

Plaintiff landowner brought action against defendant railroad to recover for erosion damage to his land caused when defendant, during construction, changed the course of a river running through plaintiff's property. Defendant raised the statute of limitations, contending that the cause of action arose in 1891 when construction was completed whereas plaintiff brought his action in 1923. Plaintiff contended that no erosion occurred until 1918. The court noted that, while plaintiff had the burden of proving damages, defendant had the burden of proving the facts supporting its statute of limitations defense. Finding that the conflicting evidence was properly submitted to the jury, the court affirmed the judgment for plaintiff. (Liptak-Fla)
W71-01744

AMERADA PETROLEUM CORP V LOUISIANA MINERAL BD (OWNERSHIP OF ROYALTIES FROM MINERAL LEASE IN STREAMBED).
203 La 473, 14 So 2d 61-72 (1943).

Descriptors: *Riparian rights, *Louisiana, *Accretion (Legal aspects), *Boundaries (Property), Bank erosion, Minerology, Drilling, Exploration, Legal aspects, Judicial decisions, Legislation, Oil wells, Oil industry, Oil reservoirs, Streambeds, Ownership of beds, Running waters, Streams, Leases, Royalties.

Plaintiff petroleum corporation, owner of an oil rights lease in a streambed, sought to interplead defendant state mineral board and a riparian owner, both of whom claimed the royalties under plaintiff's lease. Defendant mineral board contended that the royalties under the lease were rightfully due to it because the state held title to the streambed. Defendant riparian owner claimed the royalties on the theory that the oil was taken from accretion to which it held title as owner of the riparian lands adjacent to such accretion. The Supreme Court of Louisiana held that the portion from which the oil was taken was formed by accretion, and since such accretion was owned by the riparian owner and not the state of Louisiana, the riparian owner was entitled to the royalties from plaintiff's oil rights lease. (Quesada-Fla)

HEARINGS AND REPORT ON AMENDMENT TO THE WATERSHED AND FLOOD PREVENTION ACT BEFORE THE SUBCOMMITTEE ON CONSERVATION AND CREDIT, COMMITTEE ON AGRICULTURE, US HOUSE OF REPRESENTATIVES, 88TH CONG, 2ND SESSION.
Hearings and Report--Subcomm on Conservation and Credit--Amendment to Watershed and Flood Prevention Act--Comm on Agriculture, US House of Representatives, March 9, 1964; Oct 19, 1965.

Descriptors: *Watershed Protect. and Flood Prev. Act, *Soil conservation, *Flood protection, *Multiple-purpose projects, Flood control, Floodwater, Conservation, Water storage, Administrative decisions, Recreation, Dams, Reservoirs, Reservoir storage, Wildlife conservation, Eminent domain, Right-of-way, Federal government, Legislation, Floodways.

The Subcommittee on Conservation and Credit of the Committee on Agriculture met on March 19, 1964, to consider H.R. 9938, proposing to increase the limitation on floodwater detention capacity from 5,000 to 12,500 acre-feet and H.R. 9695, likewise offered to amend the Watershed Protection and Flood Prevention Act. Appearing before the Subcommittee were several representatives of the Soil Conservation Service and state conservationists, who presented statements regarding the 5,000 acre-foot limitation of floodwater storage in an effort to evidence the need for the legislation under consideration. Also discussed were the cost factors to be involved in the implementation of the projects called for by the bills, and possible problems in land acquisition. A favorable report and recommendation as to H.R. 9149, a bill to amend the Watershed Protection and Flood Prevention Act was included. Section Two of the Act (68 Stat 666) was amended as recommended by the Committee on Agriculture. (Price-Florida)
W71-01751

GLORE V HAGGARD (IMPLIED EASEMENT TO MAINTAIN PIPELINE FOR EXERCISE OF WATER RIGHTS).
143 SE 780-781 (Ga 1928).

Descriptors: *Georgia, *Water rights, *Easements, *Pipelines, Right-of-way, Prescriptive rights, Water supply, Distribution systems, Damages, Legal aspects, Judicial decisions, Relative rights, Water contracts, Water utilization, Domestic water, Water distribution (Applied), Contracts.

Plaintiff landowner brought action against defendant landowner to recover damages caused when defendant dug up and removed water pipes on defendant's property, thereby cutting off plaintiff's sole water supply. Plaintiff contended that the pipes were laid on the property by the common grantor of both lots before the grantor divided his land for sale and that the conveyance from the common grantor included the right to continued use of the water system. The court noted that the former owner's use of the pipeline created an easement appurtenant to maintain the pipes in order to enjoy the water rights. The court held that such an easement could be conveyed by general words and need not be specifically mentioned in plaintiff's deed. The trial court's granting of defendant's demurrer was reversed. (Liptak-Florida)
W71-01753

ELLERSON FLORAL CO V CHESAPEAKE AND O RY (LIABILITY FOR FLOODING CAUSED BY EXTRAORDINARY RAINFALL).
141 SE 834-836 (Va 1928).

Descriptors: *Virginia, *Surface drainage, *Culverts, *Obstruction to flow, Surface runoff, Legal aspects, Judicial decisions, Drainage, Land, Adjudication procedure, Floods, Precipitation excess, Drainage water, Rain water, Small watersheds, Surface waters, Damages, Flooding, Ravines, Railroads, Rain, Excessive precipitation.

Defendant railroad maintained an elevated roadbed across a ravine which was the only outlet for the small watershed in which plaintiff's property was located. A 36-inch pipe passed through the roadbed. On three occasions the pipe proved inadequate for passage of surface waters following heavy rains. The consequent flooding resulted in damage to plaintiff's crops. Plaintiff sought damages for a permanent nuisance. Defendant contended that the rains causing the damage were so unusual as to constitute an act of God and that the first instance of damage had occurred more than 5 years prior to the action so that an action based thereon was barred by the statute of limitations. The court in reversing the trial court's judgment for defendant, held that the statute of limitations does not run until it may be definitely determined that the damage is permanent, which determination was made in this case on the date of the second instance of damage. No evidence showed that the pipe was adequate during foreseeable storms. The act of

God doctrine was thus not applicable. (Dye-Florida)

WASHINGTON WATER CO V PARRETT (DAMAGES FROM DAM OVERFLOW).
9 F2d 915-916 (6th Cir 1926).

Descriptors: *Dams, *Ohio, *Remedies, *Subsidence, Riparian land, Soaking, Submergence, Withdrawal, Overflow, Flood damage, Streams, Maximum probable flood, Damages, Adjudication procedure, Legal aspects, Judicial decisions, Flooding, Saturation, Water spreading, Floodwater, Impoundments, Water injury.

Plaintiff riparian landowner sought to enjoin defendant water company from maintaining a dam on a creek downstream from plaintiff's land. The trail court found that the dam caused a delay in subsidence of water from plaintiff's land, thereby injuring plaintiff's property slightly, and ordered defendant to either remove the dam or alter it to prevent water from backing up onto plaintiff's land. On appeal, the court held that the trial court's remedy was wholly disproportionate to plaintiff's injury and inequitable in consideration of defendant's large expenditure in the dam. Accordingly, the case was remanded for a determination of damages. (Hart-Florida)
W71-01811

BELLAIRE, BENWOOD AND WHEELING FERRY CO V INTERSTATE BRIDGE CO (BRIDGE CONSTRUCTION OVER NAVIGABLE STREAMS).
40 F2d 323-328 (4th Cir 1930).

Descriptors: *West Virginia, *Federal jurisdiction, *Navigable rivers, *Bridge construction, Federal government, Ohio River, Navigation, Bridges, Legislation, Construction, Channels, Streams, Public rights, Piers, Abutments, Easements, State jurisdiction, Navigable waters, Boundaries (Property), Judicial decisions, Legal aspects, Watercourses (Legal).
Identifiers: Ferries.

Plaintiff ferry operator sought to enjoin erection of a bridge over the Ohio River. The bridge was to be erected pursuant to a congressional act. Plaintiff sought to enjoin defendants from appropriating land claimed by plaintiff, from interfering with the franchise and rights of plaintiff's ferry, and from interfering with plaintiff's ability to navigate the river. Defendants had the action removed to federal court. They denied plaintiff's land was being appropriated, that he had any navigational rights in the river, or that he would be unlawfully interfered with by erection of the bridge. Defendants further alleged that the stream, as to navigation, was under control of the federal government and that the bridge was authorized by Congress. The federal district court dismissed the bill of complaint and the circuit court affirmed. The federal courts had jurisdiction because the erection of bridges over navigable waters involves the laws of the United States. The trial court was correct in dismissing the bill because the bridge was lawful, plaintiff's rights were not infringed, and none of plaintiff's land was appropriated. (Duss-Florida)
W71-01846

TWIN FALLS CANAL CO V AMERICAN FALLS RESERVOIR DIST NO 2 (DIVERSION OF UNAPPROPRIATED WATER).

59 F2d 19-25 (9th Cir 1932).

Descriptors: *Idaho, *Diversion, *Use rates, *Unappropriated water, Dams, Prior appropriation, Beneficial use, Diversion structures, Relative rights, Water utilization, Usufructuary right, Compensation, Legal aspects, Judicial decisions.

Plaintiff canal company constructed and operated a dam in the Snake River. The United States constructed a dam upstream from plaintiff's dam. Defendant reservoir district, under contract with the United States, diverted water for irrigation from the slack water between the two dams. Plaintiff contended that were it not for plaintiff's dam, the level of the slack water between the dams would be too low to allow effective diversion. Plaintiff sought to force defendant to compensate plaintiff for the use of plaintiff's dam. The court, in affirming a judgment for defendant, found that plaintiff's right to the water extended only to its beneficial use at the dam. The right to use unappropriated water remained in the upstream proprietors. (Dye-Florida)
W71-01861

BIRCH V BOSTON AND M RR (LIABILITY FOR FLOOD DAMAGE CAUSED BY OVERFLOW OF DRAINAGE DITCH).
259 Mass 528, 156 NE 859-861 (1926).

Descriptors: *Massachusetts, *Flood damage, *Surface drainage, *Obstruction to flow, Ditches, Overflow, Water injury, Surface runoff, Surface waters, Cities, Railroads, Embankments, Drainage, Drains, Culverts, Saw mills, Millponds, Settlement (Structural), Subsidence, Legal aspects, Judicial decisions.

Plaintiff sawmill owner sued to compel defendant railroad to repair a drainage ditch and culvert and also sought to recover for damages caused by the overflow of the ditch after heavy rains. Plaintiff contended that the ditch was obstructed with silt, that it was too small, that the culvert was overgrown with grass and weeds and was even smaller than the ditch, and that both were insufficient to carry off the natural drainage of surface waters flowing into them. Defendant contended that the damage was due to plaintiff's neglect in not repairing the damage to his buildings and to increased flow of surface water from streets constructed by a nearby city. Affirming a judgment for plaintiff, the court held that, regardless of the source of the drainage water, it was the presence of defendant's inadequate ditch and culvert which caused the overflow and damage since it was not shown that the water from the city would have reached plaintiff's land but for defendant's ditch. The court also noted that defendant's liability could be abated by plaintiff's failure to make repairs. (Liptak-Florida)
W71-01871

BELCASTRO V NORRIS (DRAINAGE RIGHTS ACROSS ADJOINING PROPERTY).
261 Mass 174, 158 NE 535-536 (1927).

Descriptors: *Massachusetts, *Surface drainage, *Surface waters, *Relative rights, Ditches, Flow, Discharge (Water), Construction, Overflow, Surface runoff, Excavation, Damages, Land tenure, Riparian rights, Riparian land, Riparian waters, Watercourses (Legal), Legal aspects, Judicial decisions.

Plaintiffs sought to restrain defendant adjoining landowner from enlarging a ditch and to recover damages which resulted from the increased flow of water across their land occasioned by defendant's enlarged ditch. The trial court dismissed plaintiffs' bill, but the Supreme Judicial court of Massachusetts reversed. A landowner has the right to improve his land, and he is not responsible for damage caused by the natural flow of surface water incident to such improvement. However, a landowner cannot collect surface water into a ditch or artificial channel and discharge it on his neighbor's land. Plaintiffs were subject to the servitude of water running from ditches already constructed, but they could not be subjected to the servitude of an additional flow of water resulting in damage caused by construction of new and auxiliary ditches. Defendant could not drain his land by additional ditches if it increased the flow of water to plaintiffs' injury. Since exact damages could not be determined, plaintiffs were entitled to the injunction and nominal damages. (Duss-Florida)
W71-01873

HOGAN V PENNSYLVANIA RR (ALLEGEDLY INADEQUATE CONDUIT NOT PROXIMATE CAUSE OF FLOODING).
319 Pa 485, 181 A 447-448 (Pa 1935).

Descriptors: *Pennsylvania, *Conduits, *Railroads, *Backwater, Obstruction to flow, Topography, Discharge (Water), Watercourses (Legal), Damages, Runoff, Overflow, Natural flow, Culverts, Right-of-way, Flooding, Floodwater, Legal aspects, Judicial decisions.
Identifiers: *Causation (Legal).

Plaintiff landowner brought action against defendant railroad for damages to her property. The damage was allegedly caused by defendant's failure to maintain an adequate and unobstructed conduit under its tracks for discharge of waters from a natural watercourse. Defendant contended it was a physical impossibility for the flooding of plaintiff's land to have been caused by the inadequate conduit. The court found that the level of plaintiff's land was several feet higher than the level of the conduit and that, even if the passage of the conduit were completely obstructed, the water would not have flooded plaintiff's property. The water would have flowed over the conduit and into a nearby creek. For this reason the lower court's judgment of nonsuit was affirmed. (Price-Florida)
W71-01874

NATIONAL REAL ESTATE DEV CORP V LA VALE WATER CO (WATER RIGHTS AS EASEMENTS).

173 A 52-54 (Md 1934).

Descriptors: *Maryland, *Water rights, *Easements, *Land tenure, Reservoirs, Basins, Dams, Construction, Water utilization, Water supply, Conduits, Overflow, Springs, Pipes, Legal aspects, Judicial decisions, Adjudication procedure, Watercourses (Legal), Remedies.

Plaintiff corporation sued defendant water company in ejectment to recover alleged water rights. Both plaintiff and defendant had received deeds from a common grantor which conveyed water rights on a tract of land. The trial court granted defendant's motion for a directed verdict. The Court of Appeals of Maryland affirmed. Both deeds to plaintiff and defendant conveyed only certain water rights and privileges, and such rights and privileges were only easements. Therefore, if any rights of plaintiff were invaded, its remedy was an action on the case and not in ejectment. (Duss-Florida)

FIDELITY UNION TRUST CO V COCHRANE (RIGHT TO USE OF PRIVATE LAKE).

172 A 800-803 (NJ 1934).

Descriptors: *New Jersey, *Easements, *Lakes, *Land tenure, Relative rights, Riparian land, Riparian water, Riparian rights, Ponds, Recreation, Public benefits, Judicial decisions, Legal aspects, Prescriptive rights, Public rights.

Plaintiff lake owner sought to enjoin defendant owners and occupants of summer cottages surrounding the lake from fishing, boating and bathing

in said lake. Defendant's claimed an easement of boating and bathing in the lake by adverse user of their predecessor in title and themselves for twenty years or more. The court found that defendants had not occupied the land long enough to comply with the state's adverse possession laws. Also, defendants took no such rights through their predecessors since their predecessors had no such rights. The predecessors never intended to adversely possess the rights claimed by defendants. The court held that plaintiff was entitled to the injunction sought. (Price-Florida)

PUBLIC POLICY AND SHORELINE LANDOWNER BEHAVIOR,
North Carolina Water Resources Research Inst., Raleigh.
Raymond J. Burby, III, and Shirley F. Weiss.
Available from NTIS as PB-195 926, $3.00 in paper copy, $0.95 in microfiche. North Carolina Water Resources Research Institute Report No. 38, July 1970. 126 p, 18 tab, 2 fig, 29 ref, append. OWRR Project B-012-NC (5).

Descriptors: *Reservoirs, *Reservoir sites, Reservoir construction, *Land development, *Land use, *Land ownership, Land management, Watershed management, North Carolina.
Identifiers: *Land use policy.

New residential development in reservoir shoreline areas begins with the decision of a landowner to sell individual sites to recreation consumers or acreage tracts to residential developers. While this first step in the residential development process is primarily facilitative in urban areas, it assumes central importance in reservoir areas where many landowners become intimately involved in the production and sale of residential sites. Environmental deterioration in reservoir areas is in large part due to the inexperience of these landowners turned land developers. Utilizing field data from fifty-eight interviews with predevelopment landowners in five multipurpose reservoir areas in North Carolina, the empirical analyses demonstrate the existence of significant relationships between landowner characteristics and landowner decisional outcomes. Tests based on multiple discriminant analysis indicate that these relationships can be expressed in a manner suitable for field level planning. The individual discriminant programs were able to classify correctly between 79.3 percent of the observations in the case of holders versus all sellers and 91.3 percent in the case of parcel sellers versus all other landowner types. The results of the combined discriminant program strongly suggest that a single landowner model can be developed to predict landowners who are most likely to hold, sell lots, subdivide, or sell to a developer. The strategic variables isolated thus far for an operational model of shoreline land owner behavior are the following five, in order of importance: (1) income from the land; (2) occupational interest in real estate; (3) residence on the land; (4) annual personal income; and (5) purpose of acquisition. The present study thus provides a beginning of an operational planning methodology for guiding shoreline development in multipurpose reservoir areas.
W71-01888

LINDENMUTH V SAFE HARBOR WATER POWER CORP (EASEMENT FOR FLOODING CAUSED BY DAM CONSTRUCTION).

309 Pa 58, 163 A 159-163 (1932).

Descriptors: *Pennsylvania, *Dams, *Easements, *Flooding, Rivers, Lumbering, Design flood, Maximum probable flood, Overflow, Water supply, Submergence, Land tenure, Judicial decisions, Legal aspects, Water injury, Relative rights, Damsites, Trees.

Plaintiff landowner sought to enjoin defendant water power corporation from flooding his land and from cutting trees on his land. Plaintiff's predecessor in title had granted to defendant's predecessor an easement to overflow plaintiff's land upon construction of a dam. This grant, which inured to heirs and assigns, included all rights necessary for full enjoyment of the easement. Defendant's intermediate predecessors built a dam downriver from the site originally contemplated and cut some trees to prevent them from drifting downstream after the flooding and injuring the dam. Plaintiff contended that: (1) the easement was in gross, and therefore unassignable; (2) by the terms of the grant, it was unassignable; (3) building another dam downstream exhausted the easement; and (4) the easement did not include the right to remove trees. Determining that the easement was appurtenant to the dam and that the grant expressly permitted assignment, the court held that defendant owned the easement. The court further held that the agreement specified no particular damsite and that removal of the trees was reasonably necessary for full enjoyment of the easement. The lower court's decision for defendant was affirmed. (Hart-Fla)
W71-01924

RICHARDSON V TUMBRIDGE (NON-USE OF EASEMENT NOT TANTAMOUNT TO ABANDONMENT).
149 A 241-244 (Conn 1930).

Descriptors: *Connecticut, *Easements, *Drainage, *Ditches, Riddance (Legal aspects), Drainage practices, Dams, Drains, Tile drains, Obstruction to flow, Judicial decisions, Legal aspects, Streams.

Plaintiff landowner sought a judgment that his land was no longer subject to a drainage easement granted by his predecessor in title to defendant's predecessor in title. Plaintiff contended that nonuse of the right to build a drainage ditch was tantamount to abandonment of such right. Defendant, as well as his predecessor, had chosen for drainage to use a natural stream that flowed through both properties in lieu of constructing the ditch. The court held that mere non-use of a deed-created easement was insufficient to establish abandonment. Before abandonment can be established, the owner must act so as to evidence an intention to abandon the easement. Defendant's conduct was found not to be inconsistent with his right to make use of the easement. Judgment for defendant was affirmed. (Price-Florida)
W71-01928

BURKE V BOSTON AND M RR (RAILROAD'S LIABILITY FOR DEATHS CAUSED BY ROADBED WASHOUT).
134 A 574-581 (NH 1926).

Descriptors: *New Hampshire, *Railroads, *Washouts, *Surface runoff, Embankments, Accidents, Damages, Land subsidence, Roads, Highways, Cities, Road construction, Diversion, Surface waters, Ditches, Culverts, Reasonable use, Diversion structures, Legal aspects, Judicial decisions, Adjudication procedure, Surface drainage, Repulsion (Legal aspects), Riddance (Legal aspects).

Plaintiff administrators brought actions against defendant railroad to recover for the wrongful deaths of three of defendant's employees who were killed when defendant's roadbed washed out and collapsed, resulting in a train wreck. The roadbed had long been protected by a highway which acted as a dam and diverted surface water away from the roadbed. Plaintiffs contended that defendant was negligent in not taking precautions against changed conditions after the highway had been reconstructed and failing to provide for surface water which crossed the highway and washed out the roadbed. Defendant contended that it relied on the continued protection of the highway absent any notice that the changes in the highway changed the direction or flow of the surface runoff and absent any obvious indications that the highway's protection had ceased. The court noted that defendant could not rely on the continuation of the highway's gratuitous protection, but was only responsible to make reasonable inquiry into changed conditions. Finding the lower court erred in not submitting defendant's requested instruction on the reasonable care standard, the court reversed and remanded for new trials the judgments for plaintiffs. (Liptak-Florida)
W71-01949

NICHOLS V FERNALD (UNREASONABLE USE OF FIRST RIGHTS IN SPRING).
131 A 836-837 (NH 1926).

Descriptors: *New Hampshire, *Preferences (Water rights), *Reasonable use, *Water pollution, Water rights, Springs, Competing uses, Legal aspects, Judicial decisions, Land tenure, Water utilization, Water users, Diversion, Potable water, Water supply, Water pollution sources, Animal wastes (Wildlife), Wastes, Relative rights.

Plaintiff and defendant owned adjacent property. Defendant's predecessor, plaintiff's grantor, had reserved the first use of water from a spring on plaintiff's property. Plaintiff sued to restrain defendant from interfering with plaintiff's right to use the water. Plaintiff contended that defendant made unreasonable use of the spring by allowing his cattle to feed there and pollute the spring. Defendant contended that plaintiff had interfered with the first use of the water by covering the spring and also used water for purposes other than those allowed under the deed. The court noted that if plaintiff had interfered with the first use of the water, defendant still had no right to remove the cover from the spring or make unreasonable use of the water and cause pollution, but should have resorted to his legal remedies. Finding that plaintiff's uses of the spring were only negligible breaches of the covenants in the deed, the court affirmed the trial court's judgment for plaintiff. (Liptak-Fla)
W71-01953

LOUISVILLE AND NASHVILLE RR V MIDDLETON (LIABILITY FOR DAMAGE FROM OVERFLOW OF DRAINAGE WATER CAUSED BY ROAD CONSTRUCTION).
260 Ky 755, 86 SW2d 982-983 (1935).

Descriptors: *Kentucky, *Drainage water, *Flood damage, *Road construction, Railroads, Culverts, Drains, Ditches, Surface drainage, Local governments, Overflow, Water injury, Damages, Obstruction to flow, Roads, Highways, Sediments, Sediment control, Easements, Right-of-way, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff landowner brought action against defendants railroad and county. The county had reconstructed a road and a culvert along the railroad's right-of-way, thereby causing water, sediment and debris to discharge onto plaintiff's adjoining property. Plaintiff contended that the drains and culvert were improperly constructed and maintained, resulting in damage to his property. The jury exonerated the county but found the railroad liable. Reversing a judgment for plaintiff, the court found that defendant railroad had no control over defendant county's method or manner of construction of the road or culvert and held that, even if the railroad did have such control, it could not be liable unless the county had first been found liable. (Liptak-Fla)
W71-01958

CHICAGO, ST L AND N O RR V HICKS (RAILROAD'S LIABILITY FOR FLOOD DAMAGE CAUSED BY ERODED EMBANKMENT).
249 Ky 578, 61 SW2d 37-41 (1933).

Descriptors: *Kentucky, *Embankments, *Washouts, *Damages, Water injury, Railroads,

Construction, Erosion, Cultivated lands, Compensation, Flood damage, Sedimentation, Drains, Ditches, Crop response, Obstruction to flow, Drainage water, Judicial decisions, Legal aspects, Remedies.

Plaintiff landowners brought an action against defendant railroad company to recover for flood damage to their crops. The damage was caused by defendant's embankment washing out and clogging plaintiffs' drainage ditches. Plaintiffs contended that the embankment was improperly constructed, could easily be repaired, and that they were entitled to maintain successive damage actions if the flooding continued. Defendant contended that the embankment was a permanent structure and that plaintiffs could only recover once. Reversing a judgment for plaintiffs, the court held that the lower court should have submitted to the jury the question of whether the embankment was a temporary or a permanent structure. The measure of recovery would differ depending upon the theory chosen. (Liptak-Florida)
W71-01963

DE KALB COUNTY V TENN ELEC POWER CO (LIABILITY FOR FLOOD DAMAGE CAUSED BY DAM OVERFLOW DURING UNPRECEDENTED FLOOD).
67 SW2d 555-561 (Tenn 1933).

Descriptors: *Tennessee, *Historic flood, *Dams, *Flood damage, Floods, Maximum probable flood, Floodgates, Local governments, Bridges, Damages, Water injury, Rivers, Washouts, Overflow, Flood control, Hydroelectric plants, Electric power industry, Judicial decisions, Legal aspects.

Plaintiff county brought action to recover for the destruction of a county bridge. The destruction was allegedly caused by defendant electric power company's negligent operation of its dam and floodgates during a heavy rainstorm and flood. Plaintiff contended that the damage resulted from defendant's release of excess floodwater. Defendant contended that there was no negligent operation of the dam and that the damage was caused by an unprecedented flood which defendant was not required to anticipate. Affirming a judgment for defendant, the court held that defendant had a right to pass flood waters through its gates at the same rate that it flowed into the dam pond. From the uncontradicted evidence, at no time during the flood did the pond level fall below normal. In fact, the water level rose over the top of the dam with all the floodgates open. The only reasonable conclusion was that there had been no negligence on defendant's part. (Liptak-Florida)
W71-01965

DEASON V SOUTHERN RY (DAMAGES FOR OBSTRUCTION TO DRAINAGE).
140 SE 575-581 (SC 1927).

Descriptors: *South Carolina, *Surface drainage, *Obstruction to flow, *Repulsion (Legal aspects), Surface water, Land tenure, Damages, Flow, Railroads, Ditches, Right-of-way, Surface runoff, Channels, Compensation, Reasonable use, Outlets, Drainage, Watercourses (Legal), Legal aspects, Judicial decisions, Ponds, Embankments, Natural flow, Prescriptive rights.

Plaintiff upper landowner sought damages from defendant railroad for preventing the flow of water from a pond on plaintiff's property. Defendant had allegedly, without adequate provision for drainage, erected an embankment and obstructed plaintiff's ditch. In affirming a judgment for plaintiff, the South Carolina Supreme Court held that surface water is a common enemy, and every landowner has the right to protect himself from it. However, one cannot protect himself by backing water onto another's land, thereby creating a nuisance. There was sufficient evidence for the jury to decide that a nuisance was created by the embankment and ditch fill. As to plaintiff's right to the ditch, it was clear it had been in existence longer than the required prescriptive period. On a petition for rehearing one judge dissented, pointing out that the obstruction complained of occurred long before plaintiff acquired title to the property. Any action based on defendant's negligent construction of the embankment could only have been brought by plaintiff's grantor. (Duss-Fla)
W71-02012

NIAGARA FALLS POWER CO V WATER POWER AND CONTROL COMM'N (RIGHTS OF STATE IN GRANTED LANDS).
237 App Div 216, 262 NYS 217-228 (1932).

Descriptors: *New York, *Dams, *Rates, *Diversion structures, Electric powerplants, Hydroelectric plants, Structures, Municipal water, Water utilization, Industrial water, Diversion tunnels, Industrial production, Damsites, Legal aspects, Judicial decisions, Governments, Legislation, Artificial use, Water users, Usufructuary right.

Petitioner power company sought to have respondent water power commission's determination of changes for petitioner's diversion of water reviewed. Petitioner contended that only those rates which were agreed to in its contract with the state were valid. Petitioner further contended that the state did not have title to such rights of diversion for which the state could charge rents because the state had conveyed such rights to it. Respondent contended that since the state had the right to retake previously granted submerged land and the rights connected with them for navigational purposes or the public welfare, it had the right to charge an equitable annual rent for the rights of diversion. Respondent further claimed that the contract between the state and petitioner allowed respondent to increase the rates if petitioner diverted water in excess of the maximum quantity allowed. The court held that while the state could not grant submerged land so as to divest itself of the title held in trust for the public, riparian rights could be severed from the land and conveyed separately. Therefore the court found that the state did not have either title or a proprietary interest in the right to divert water flowing over the granted land for which it could assess charges except as set forth in the terms of the grant. (Quesada-Florida)
W71-02038

SHANDALEE CAMP, INC V ROSENTHAL (OWNERSHIP OF BED NON-NAVIGABLE LAKE).
133 Misc 502, 233 NYS 11-16 (1929).

Descriptors: *New York, *Lakes, *Ownership of beds, *Riparian rights, Easements, Land tenure, Riparian land, Riparian waters, Relative rights, Boundaries (Property), Boundary disputes, Judicial decisions, Legal aspects, Watercourses (Legal).

Plaintiff sought to enjoin defendant from using a portion of a small, non-navigable, freshwater lake which was located within the boundary lines of his property. Defendant sought similar relief. Plaintiff contended that each owned that part of the lake as was described in their deeds as being within their boundary lines. Defendant contended that all who owned property abutting on the lake owned to the center of the lake irrespective of their boundary lines. The court said that the lake was subject to private ownership. However, the rule that adjoining proprietors are presumptively owners of the soil under the water to the center of the lake was not applicable. Plaintiff and defendant owned land not bounded by the lake but by lines within which portions of the lake were included. The principles of private ownership apply to the bed of a small lake as they do to any other land. The owner of a portion of a lake bed has exclusive rights of boating, bathing and fishing in the waters over it. The parties were granted injunctive relief accordingly. (Price-Florida)
W71-02039

STRONG V TRUSTEES OF FREEHOLDERS AND COMMONALTY (INTERPRETATION OF DEED CONVEYING UPLANDS AND LOWLANDS).
133 Misc Rep 165, 231 NYS 664-666 (1928).

Descriptors: *New York, *Contracts, *Boundary disputes, *Boundaries (Property), Right-of-way, Ownership of beds, Beaches, High water mark, Legal aspects, Judicial decisions, Land tenure, Real property, Adjudication procedure.

Plaintiff claimed certain lowlands and brought action to remove a cloud on the title thereto. The court found it necessary to interpret the contract by which plaintiff sold certain uplands. The court found that when plaintiff conveyed such uplands, he also included his title to the submerged land abutting the uplands, any rights of way appurtenant thereto, and all lowlands adjoining said premises. Therefore, the court held that plaintiff had conveyed all his rights, title and interests in the lowlands in question as well as the uplands. A judgment was rendered for defendants. (Price-Florida)
W71-02046

BENNETT V CUPINS (LIABILITY FOR DIVERSION OF SURFACE WATER).
132 Misc 556, 230 NYS 550-553 (1928).

Descriptors: *New York, *Damages, *Surface waters, *Diversion, Drainage, Drainage practices, Diversion structures, Diversion losses, Gravel, Relative rights, Judicial decisions, Legal aspects, Landfills, Grading, Surface runoff.

Plaintiff landowner brought action for damages and sought an injunction against defendant's diversion of surface waters over her property. Defendant's adjoining land, previously servient to plaintiff's so far as regarded surface water drainage, was filled in so as to cause water to flow back onto plaintiff's property. Defendant, relying on case law, contended plaintiff had no remedy. The court distinguished the case relied on by defendant and held that plaintiff did have a cause of action. Plaintiff was entitled to the differences in the rental value caused by defendant's actions, special damages for cleaning by plaintiff, injunctive relief and permanent damages if the nuisance was not abated within a reasonable time. (Price-Florida)
W71-02058

ANTON V STANKE (UPPER PROPRIETOR'S LIABILITY FOR DAMAGE CAUSED BY HIS DIVERSION OF DRAINAGE WATER).
251 NW 153-157 (Iowa 1933).

Descriptors: *Iowa, *Riddance (Legal aspects), *Drainage effects, *Runoff, Discharge (Water), Diversion, Land management, Damages, Remedies, Legal aspects, Judicial decisions, Culverts, Natural flow doctrine, Drainage systems, Relative rights, Highways.

Plaintiff landowner sought to enjoin defendant upper landowner from diverting the drainage runoff from defendant's land into a highway drainage system which flowed by plaintiff's land. Plaintiff contended that defendant was diverting the runoff from its natural course and channeling it through the highway culvert onto plaintiff's land. Plaintiff maintained that defendant's actions resulted in an increase in the amount of water carried by the highway drainage system and that this increase was the cause of the system's overflow which damaged his land. Defendant contended that he was not diverting the groundwater from its natural course. He denied that he made any changes and claimed that upper landowners had a right to unobstructed natural runoff from their land. The Supreme Court of Iowa held that while upper landowners may drain their lands through natural watercourses so as to increase flow over servient lands, this increase cannot be in such an unnatural quantity as would damage other lands. (Quesada-Florida)
W71-02065

HERMAN V DREW (LANDOWNER MAY NOT INTERFERE WITH HIGHWAY DRAINAGE SYSTEM WHICH FOLLOWS THE NATURAL COURSE OF LAND'S DRAINAGE).
249 NW 277-278 (Iowa 1933).

Descriptors: *Iowa, *Surface runoff, *Drainage systems, *Repulsion (Legal aspects), Drainage engineering, Governments, Dams, Ditches, Topography, Paving, Surface waters, Natural flow, Obstruction to flow, Relative rights, Legal aspects, Judicial decisions, Highways, Highway effects, Road construction, Roadbanks.

Plaintiff township trustees sought to enjoin defendant landowner from maintaining a dam across the boundary of his land. The dam prevented runoff from plaintiff's highway from flowing onto defendant's land. This caused the runoff to back up onto the highway. Plaintiff contended that it had maintained the highway and its adjoining drainage systems for over twenty years and further contended that the drainage system followed the natural drainage flow of the land. Therefore, defendant could not obstruct the flow. Defendant contended that such drainage was damaging his land and that it altered the natural flow of the draining water. The Supreme Court of Iowa held that defendant could not interfere with the plaintiff's drainage system since it simply maintained the natural course of the land's drainage. (Quesada-Florida)
W71-02072

SIMONSON V ALDEN TOWNSHIP (LIABILITY FOR DRAINAGE OF SURFACE WATER).
231 NW 921-922 (Minn 1930).

Descriptors: *Minnesota, *Surface drainage, *Reasonable use, *Damages, Surface runoff, Discharge (Water), Watercourses (Legal), Relative rights, Highways, Swamps, Drainage, Land, Land tenure, Cities, Tile drains, Overlying proprietor.
Identifiers: Alden (Minn).

Plaintiff sought an injunction restraining defendants from discharging surface water from the land of defendant upper landowner onto plaintiff's land. Defendants township and upper landowner constructed a tile drain to drain the landowner's swamp so that the water flowed upon plaintiff's lands. Plaintiff admitted that defendant, as upper landowner, had the right to discharge surface water from his land, but contended that construction of the drain from the swamp was unreasonable. The trial court ruled for plaintiff and found that his land would be permanently damaged if the flooding were continued. The Supreme Court of Minnesota stated that an upper proprietor may not unreasonably gather water and cast it upon lower lands in destructive quantities. The question of reasonablenesss is a fact question, and the court held that the evidence justified the trial court's judgment for plaintiff. (Duss-Florida)
W71-02077

THOMPSON V BOARD OF SUPERVISORS (RELIEF FROM ADMINISTRATIVE RULINGS).

206 NW 624-627 (Iowa 1925).

Descriptors: *Iowa, *Drainage districts, *Administrative decisions, *Surface drainage, Administrative agencies, Discharge (Water), Drains, Surface waters, Outlets, Watersheds (Basins), Public benefits, Legislation, Topography, Drainage practices, Channel morphology, Judicial decisions, Legal aspects, Assessments.

Plaintiffs appealed a ruling of defendant board that plaintiffs' property be included in an expansion of a drainage district. Plaintiff contended such inclusion was arbitrary and not justified under the relevant statute since their lands would be benefited by the expansion. From a judgment for plaintiffs reversing its order, defendant appealed. Defendant's main contention was that the trial court lacked jurisdiction since the board's procedure which plaintiffs attacked was legislative, and there was no right of appeal provided in such procedure. Citing case law, the court held that plaintiffs had a right to appeal the order and to try de novo the fact question of whether their lands would be benefited by the proposed improvement. The court also stated that a landowner may freely avail himself of the topography of his land and discharge his surface water wherever gravitation naturally carries it without further concern on his part as to where it goes. The judgment for plaintiffs was affirmed. (Price-Florida)
W71-02078

DAVIS V HAINES (ISLAND OWNER OWNS ACCRETIONS TO THE ISLAND).
349 Ill 622, 182 NE 718-722 (1932).

Descriptors: *Illinois, *Islands, *Accretion (Legal aspects), *Riparian rights, Legal aspects, Judicial decisions, Remedies, Mississippi River, Navigable rivers, Boundaries (Property), Ownership of beds, Riparian waters, Riparian land, Pastures, Low flow, Water level fluctuations, Underwater, Real property, Land tenure.
Identifiers: *Towheads.

Plaintiff sought to quiet title to a towhead in the Mississippi River and to eject defendants therefrom as trespassers. Plaintiff claimed to be the owner, through adverse possession, of an island to which the towhead was connected at low water. Consequently, plaintiff also claimed ownership of the towhead. Defendants countered that they owned the towhead by virtue of quitclaim deeds accompanying their purchase of riparian land east of the river. The Supreme Court of Illinois reversed a lower court decision for defendants, finding that plaintiff had used the towhead for pasturage and cutting of willows and that such acts constituted adverse possession. Further, the court held plaintiff was owner of the towhead through accretion to the island. The rule that a riparian owner owns to midstream applies so that an owner of an island owns to midstream on both sides of the island. (Morris-Florida)
W71-02084

BENNETT V CUPINA (LIABILITY OF LANDOWNER FOR ALTERING GRADE OF LAND).

253 NY 436, 171 NE 698-699 (1930).

Descriptors: *New York, *Surface runoff, *Riddance (Legal aspects), *Grading, Water control, Legal aspects, Judicial decisions, Remedies, Damages, Surface drainage, Slopes, Surface waters, Repulsion (Legal aspects), Watercourse (Legal), Artificial watercourses, Relative rights, Land use, Land management.

Plaintiff sought damages and an injunction to require defendant adjacent landowners' removal of a driveway which caused surface water to flow on plaintiff's land. Plaintiff's land originally was higher than defendants', and surface water flowed onto defendants' property. Predecessors of defendants, however, filled the land in and graded it for erection of a schoolhouse. Defendants contended that since the improvements to their land did not create or alter a definite watercourse, they could not be held liable. The New York Court of Appeals reversed a lower court decision for plaintiff. Any owner may change the natural contour of his land, and as long as he does not create or alter a defined watercourse, any resulting damage does not give rise to a cause of action. (Morris-Florida)
W71-02086

STATE V FORSYTH (TITLE TO LAND CREATED BY RELICTION).
162 NE 661-663 (Ind 1928).

Descriptors: *Indiana, *Accretion (Legal aspects), *Land tenure, *Boundaries (Property), Boundary disputes, Riparian land, Lakes, Water level fluctuations, Riparian rights, Swamps, Lake stages, Nonnavigable waters, United States, Patents, Governments, Surveys, Mapping, Remedies, Judicial decisions, Legal aspects.
Identifiers: Reliction.

Plaintiff state sought to quiet title to certain land created by the recession of a lake. Title to the lake and its bed had been given to the state by the United States. Certain areas bordering closely on the lake were subsequently patented by the state to defendant's predecessor. Plaintiff claimed that its grants were not intended to make the grantees riparian owners. The court found that the grants did make the grantees riparian owners and as such the owners of land created by the recession of the water in the lake. (Barker-Florida)
W71-02087

COLE V PITTSBURGH AND L E RR (LOCATION OF BOUNDARY ON NON-NAVIGABLE STREAM).

162 A 712-717 (Pa 1932).

Descriptors: *Pennsylvania, *Banks, *Boundary disputes, *Boundaries (Property), High water mark, Low water mark, River beds, Ownership of beds, Legal aspects, Judicial decisions, Streambeds, Navigable waters, Railroads, Bridges, Streams, Relative rights, Non-navigable waters, Real property.

Plaintiff riparian landowner brought an action in ejectment against defendant railroad compnay, contending that he was the rightful owner of the land which lay between his riparian land and the low water mark of the river which formed a boundary of his land. Plaintiff contended that since his vendor described the boundary in question as 'along the banks' and that since his vendor owned, at the time of the conveyance, two-thirds of the bed of the river whose banks were to form the boundary, the vendor had intended to convey the land to him all the way out to the low water mark. Defendant, who later acquired the land in question from plaintiff's vendor, contended that the vendor had only conveyed to plaintiff the riparian land to the banks. Defendant contended that the words 'along the banks' meant those boundaries which contain the water at the points of its highest flow. The Supreme Court of Pennsylvania agreed with defendant's interpretation of the terms of the deed and held that the vendor conveyed land only to the banks of the river to plaintiff. The court stated that the presumption that a grantor of land bounded by a stream intends the boundary to extend to the stream is rebuttable, and the vendor's use of 'along the banks' as the description of the boundary was sufficient to rebut the presumed intent. Consequently, defendant was the rightful owner of the land from the banks to the low water mark. (Quesada-Florida)

MASONITE CORP V HILL (POLLUTION VICTIM MUST PROVE CERTAIN POLLUTANT CAUSED INJURY).
154 So 295-299 (Miss 1934).

Descriptors: *Mississippi, *Pollutant identification, *Water pollution effects, *Industrial wastes, Legal aspects, Judicial decisions, Recreation, Damages, Water sports, Water pollution, Fishkill, Water pollution sources, Effluents, Oxygenation, Municipal wastes, Water analysis, Pulp wastes, Chemical wastes, Alcohols, Streams, Downstream.

Defendant manufacturer of masonite emptied a very small percentage of poisonous methyl alcohol, and a few other chemicals, into a creek, causing unidentified chemical changes to take place. Fish died from lack of oxygen. At least two cities and several other industries also dumped effluent into the creek. Plaintiff bather sued defendant manufacturer of masonite for burns allegedly caused by defendant's pollution of the river in which plaintiff

waded. Defendant contended that plaintiff had not sufficiently proved the causal connection between defendant's effluent and plaintiff's injury. The Supreme Court of Mississippi, in reversing a lower court decision for plaintiff, held that the inferences relied on by plaintiff were extended too far. Plaintiff had not sufficiently met the burden of proving that defendant's plant's effluent caused the injury. Chemical analysis of the water would have been possible, and a series of inferences was not a satisfactory substitute. (Morris-Florida)
W71-02092

DAVIS V GARDEN HILLS CORP (PROPER MEASURE OF DAMAGES FOR POLLUTION OF STREAM).
148 SE 861-864 (Ga 1929).

Descriptors: *Georgia, *Water pollution, *Damages, *Profit, Sewage, Streams, Legal aspects, Judicial decisions, Impaired water quality, Local governments, Water pollution effects, Water pollution sources, Riparian rights, Downstream, Pollutants, Milk, Dairy industry, Cattle, Adjudication procedure, Land tenure.

Plaintiff dairy farmer sued for actual and punitive damages, alleging that defendant real estate developer had caused pollution of a stream and thereby reduced the profits of plaintiff's dairy business. Plaintiff alleged that he had spent money for cows and equipment for the leased property and that he had been operating at a profit before defendant built and sold houses on its property, draining sewage into a stream which flowed onto plaintiff's property and from which plaintiff's cows obtained water. The City of Atlanta health department told plaintiff to quit using the polluted water, thus forcing plaintiff to spend additional money to obtain water and reducing his profits. Defendant contended that plaintiff did not allege a proper measure of damages. The Georgia Court of Appeals held that since plaintiff was a tenant, the damage should be the difference in the value of the tenancy before and after the pollution, not the dimunition in profits. (Morris-Florida)
W71-02093

SOZANSKA V TOWN OF STRATFORD (DRAINAGE OF SURFACE WATER DISCHARGED FROM PUBLIC STREETS).
153 A 164-166 (Conn 1931).

Descriptors: *Connecticut, *Obstruction to flow, *Riparian rights, *Natural streams, Streams, Drainage, Highways, Relative rights, Public rights, Cities, Local governments, Surface waters, Diversion, Judicial decisions, Legal aspects, Streamflow, Grading, Surface drainage, Land, Surface runoff, Tile drainage, Ditches.
Identifiers: Stratford (Conn).

Plaintiff landowner's property contained a tile drain once used to channel the flow of a stream fed by a stream located on the other side of a public highway from plaintiff's land. A change in grade of the highway altered the course of the stream so that it no longer crossed plaintiff's land. For years since the change in course, the drain had been obstructed by accumulated soil. Defendant town entered plaintiff's land without his permission and sought to open the drain located in plaintiff's front yard. Plaintiff sought damages for trespass and an injunction. Defendant contended that the drain was the channel of a natural stream and that defendant, as an upstream riparian owner, was entitled to its unobstructed flow. In affirming the trial court's judgment for plaintiff, the court found that the alleged natural watercourse had ceased to exist, and thus defendant was no longer a riparian owner. The court further held that Connecticut statutes prohibited discharge of surface waters from public streets through or under the yard of any dwelling house. (Dye-Florida)
W71-02094

MARBA SEA BAY CORP V CLINTON STREET REALTY CORP (BOUNDARY DISPUTE RELATING TO HIGH WATER MARK).

272 NY 292, 5 NE2d 824-829 (1936).

Descriptors: *New York, *High water mark, *Seashores, *Boundary disputes, Legal aspects, Ownership of beds, Banks, Tidal waters, Low water mark, Judicial decisions, Public lands, Governments, Oceans, Land tenure.

Plaintiff corporation brought an action in partition against defendant realty corporation which had taken title from the state. Plaintiff contended that it had title through a colonial grant. Plaintiff argued that it owned all the waterfront property, including the foreshore, and was not limited by the high water mark. Defendant contended that such colonial grant was void because it was made to private persons for neither commercial nor governmental purposes and was thus against public policy. The New York Court of Appeals held for defendant. The colonial title was void as against public policy. It conveyed public lands for non-public purposes. Moreover, the court found that the deed, describing a boundary as 'bounded southerly by the Atlantic Ocean', conveyed title no further than the high water mark. This excluded the foreshore. (Quesada-Florida)
W71-02097

MONTANA POWER CO V ROCHESTER (OWNERSHIP OF LAND BETWEEN HIGH AND LOW WATER MARKS).
127 F2d 189-193 (9th Cir 1942).

Descriptors: *Montana, *Ownership of beds, *Patents, *Easements, Navigable waters, High water mark, Low water mark, Boundaries (Property), Boundary disputes, Dams, Reservoirs, Outlets, Lakes, Flooding, Relative rights, Right-of-way, Federal government, Legislation, Judicial decisions, Legal aspects, United States.

Plaintiff owned an island in a lake. The island was connected to the shore by a bar. The owner of the lot where the bar met the shore had granted plaintiff an easement over his lot and the bar. Defendant power company had, with the permission of the Federal Power Commission, flooded the bar. Plaintiff sought damages as such flooding made her island inaccessible except by boat. Plaintiff contended that the owner of the shore lot owned to the low water mark and had title to the bar and that she was entitled to damages for the destruction of her easement. Defendant contended that the shore lot owner held title only to the high water mark, that the United States held title to the bar as part of the lake bed, and that the lot owner had no right to grant the easement now claimed by plaintiff. The court held that the general rule is that United States' patents to lands bordering on navigable waters convey title only to the high water mark. The area between the high and low water marks should be in the sovereign. Consequently, plaintiff's easement was improperly granted, and the trial court's judgment for plaintiff was reversed. (Price-Florida)
W71-02098

RICHARD T GREEN CO V CITY OF CHELSEA (TAXATION OF REAL PROPERTY ON NAVIGABLE WATERS).
149 F2d 927-932 (1st Cir 1945).

Descriptors: *Massachusetts, *United States, *Real property, *Taxes, Judicial decisions, Legal aspects, Legislation, Navigable waters, Federal government, Assessments, Low water mark, Cities, Local governments, Docks.

The United States took certain waterfront land under its power of eminent domain. The questions involved in the instant case were whether certain tax liens asserted by plaintiff city against the land were valid, whether a marine railway which was located on the land was real or personal property, and whether the entire railway, part of which extended below the low water mark, was taxable as realty. The court held that the fact that the license for construction of the railway extended only to the low water mark was not conclusive in construing the machinery to be personal property even though Massachusetts law indicated that private property in lands adjacent to navigable waters extends only to the low water mark. Although such license did not grant title to the real estate, there was no reason why the railway would not be assessed as real estate for purposes of taxation. The circuit court affirmed the district court's determination that under Massachusetts law, such a structure attached to the land was real estate and thus subject to taxation. (Barnett-Florida)
W71-02100

POINSETT LUMBER AND MFR CO V UNITED STATES (COMPENSATION FOR PHYSICAL INVASION OF PRIVATE PROPERTY BY GOVERNMENT PROJECTS).
91 Ct Cl 264-268 (1940).

Descriptors: *United States, *Compensation, *Levees, Flood control, *Arkansas, Legislation, Lumbering, Judicial decisions, Legal aspects, Missouri, Federal government, Drainage districts, Drainage engineering, Construction, Flood protection, Dams, Diversion, Alteration of flow, Headwaters, Tributaries, Backwater, Beneficial use, Eminent domain, Flood damage.

Plaintiff lumber company owned timber lands situated along the banks of the St. Francis River in Arkansas. Defendant, pursuant to statute, entered upon the land for the purpose of establishing a new levee line in accordance with a plan of levee construction on the tributaries of that river. Plaintiff alleged that such planned construction would force the waters of the river over its lands resulting in the destruction of the standing timber thereon. The Court of Claims held that nothing had been done by defendant's engineer which would directly cause the diversion of water over the property in question. The construction work was found not to affect plaintiff's use or occupation of the lands. The court stated that in order to constitute a taking such as will entitle an owner to maintain a suit against the government for compensation, it must definitely appear that there has been an actual physical invasion or encroachment upon private property, or else such a direct physical destruction as to permanently dispossess the owner. (Barnett-Florida)

WATER SUPPLY AND WASTE WATER DISTRICTS IN SUBURBIA,
Myron K. Nelson, and R. L. Chandler.
In: Proceedings, American Society of Civil Engineers, Journal of the Sanitary Engineering Division, Vol 96, No SA2, p 593-604, April 1970. 5 fig, 1 tab.

Descriptors: *Water district, *Urbanization, *Management, *Water supply, Sewage treatment, Sewers, Water treatment, Sanitary engineering, Institutions, Administration.
Identifiers: *Suburbia, *Waste water treatment districts.

Formation of water and sewer districts in a highly urbanized area composed of fourteen separate cities are described. The water districts have encouraged the orderly development of this rapidly expanding area in the following ways: (1) The ability of the district to finance large major improvement projects when such improvements are needed; (2) the main extension policies of the District which assure recovery of the original investment or deposit by the developer through refunds after customers are connected to the mains; and (3) the practice of constantly studying and reviewing the projected needs of the District. The waste water districts use the following methods: (1) The

ability of the Districts to meet varying conditions of development; (2) the ability of the Districts to plan and finance on a major watershed basis; (3) one central administration for all Districts permits an economical operation as well as uniform rules, regulations, and other requirements; and (4) the ability of the Districts to finance enlargements of collection and treatment facilities by a resolution of the governing body without additional elections or petitions. (Davis-Chicago)
W71-02117

LOUISIANA DELTA CATTLE CO V UNITED STATES (LIABILITY FOR PROJECTED DAMAGES FROM PROPOSED IMPROVEMENT).

93 Ct Cl 662-666 (1941).

Descriptors: *Louisiana, *Flood control, *United States, *Compensation, Flood protection, Mississippi River, Judicial decisions, Legal aspects, Levees, Drainage, Precipitation excess, Federal government, Outlets, River flow, Eminent domain, Public rights, Damages, Remedies, Legislation, Condemnation, Flood damage, Water injury.

Plaintiff owned lands adjacent to the Mississippi River which were protected against flood or water submergence by public levees along the banks of the river. As a result, plaintiff's lands were arable, valuable and subject to easy drainage of intense rainfall. Defendant, pursuant to a plan under the Flood Control Act, selected a new set-back or levee line which plaintiff alleged would cause all flood protection to be withdrawn, allowing the river to overflow and damage its land. Plaintiff sought to recover the value of the land as a result of these acts. The court held that plaintiff was not entitled to recover where there was no allegation in its petition of a past or consummated innundation or damage and where the damage alleged was prospective upon the abandonment or removal of the previous levees. The court held that the mere fact that the value of the property was injured or affected by some act which the government proposed to do in the future did not establish a 'taking' within the meaning of the fifth amendment. (Barnett-Florida)
W71-02118

ANDERSON V REAMES (RIPARIAN RIGHTS OF LAKE PROPERTY OWNER)
161 SW2d 957-961 (Ark 1942).

Descriptors: *Arkansas, *Riparian land, *Riparian rights, *Public rights, Remedies, Reasonable use, Banks, High water mark, Low water mark, Legal aspects, Judicial decisions, Docks, Piers, Boats, Recreation, Boat-launching ramps, relative rights, Land use, Lakes, Lake shores.

Plaintiff fish camp operators sought an injunction to force defendant riparian lessees to allow plaintiffs' customers onto certain riparian land. Plaintiffs contended that by reason of the fact that the lake was navigable, they, as members of the public, had the right to operate a commercial boat dock and use the shore in the conduct of their business. Defendants contended that the right to operate a dock and use the banks was a riparian right belonging to the owner of the riparian land, which was properly leased to them. While holding that plaintiffs' structures had to be removed from defendants' lands, the Supreme Court of Arkansas also delineated the following rights of a riparian landowner and of a member of the public: (1) the riparian owner has use and control of his land to the high water mark; (2) the only right that a riparian owner has over the rights of the general public is the right to free ingress and egress to his property along its edge; (3) the riparian rights of an owner include access to the water, the right to build a pier to the line of navigability, and the right to accretion and reasonable use of the water; and (4) no private person can claim an exclusive right to fish in navigable water. (Quesada-Florida)
W71-02119

FARRAR V SHUSS (RIGHTS OF SERVIENT LANDOWNER TO PREVENT FLOW OF SURFACE WATER ONTO HIS PROPERTY).
282 SW 512-515 (Mo 1926).

Descriptors: *Missouri, *Impounded waters, *Surface waters, *Repulsion (Legal aspects), Diversion, Flooding, Floodwater, Drainage, Discharge (Water), Impoundments, Reservoirs, Dams, Overflow, Surface runoff, Backwater, Diversion structures, Easements, Judicial decisions, Legal aspects, Flood damage, Damages.

Plaintiff landowner sought damages for injury to his property allegedly caused by the collection of surface water behind defendant's reservoir and by the negligent maintenance of said reservoir which caused the water to be released with force on plaintiff's land. Defendant demurred to plaintiff's allegations. The court stated that in order to recover for the discharge of surface water upon the land of another, some negligence must be shown. The court found that defendant was negligent in the construction or maintenance of the reservoir. Defendant had no right to dam up the water and throw it back with destructive force onto plaintiff's land. The owner of a servient estate may erect obstructions to prevent surface water from coming onto his land and in this manner throw water back on the dominant estate without incurring liability. The court held, however, that defendant had collected the water which caused plaintiff's injury and did not act simply to prevent such water from coming onto his property. The trial court's judgment for defendant was reversed. (Price-Florida)

KILGO V COOK (OWNERSHIP OF BEDS OF NON-NAVIGABLE STREAMS).
295 SW 355-357 (Ark 1927).

Descriptors: *Arkansas, *Boundary disputes, *Ownership of beds, *Meanders, Streams, Rivers, Real property, Boundaries (Property), Banks, Beds, Legal aspects, Judicial decisions, Shores, Navigable waters, Navigable rivers, Running water, River beds, Riparian rights, Riparian land, Nonnavigable waters, Recreation, Lakes, Streambeds.

Properties of plaintiff and defendant were originally part of a single grant. The government survey of the original grant took no notice of a nonnavigable stream which ran through the property. The description in plaintiff's deed extended his property to the east bank of the stream, including the streambed. Defendant's property, across the stream, was also bounded by the east bank. Plaintiff sought to quiet title in the streambed and to restrain defendant from trespassing thereon. Defendant claimed to be a riparian owner, and as such the owner to the thread of the stream. The Supreme Court of Arkansas reversed a judgment for defendant. Although owners of land bordering a meandered non-navigable stream take title to the center of the stream, where property was surveyed as land and the streams therein were not meandered, the owner of the land may dispose of it in the manner of his choosing, even to the exclusion of some grantees' riparian ownership. In the instant case the stream in question was not meandered. Since defendant took title with notice of the prior grant of the streambed to plaintiff, he could not later claim to be a riparian owner. (Dye-Florida)
W71-02125

DUGAN V LONG (LIABILITY FOR DIVERSION OF NATURAL FLOW OF SURFACE WATER).
234 Ky 511, 28 SW2d 765-767 (1930).

Descriptors: *Kentucky, *Surface waters, *Natural flow, *Landfills, Landscaping, Ponding, Rain, Flooding, Canals, Culverts, Judicial decisions, Legal aspects, Construction, Grading, Obstruction to flow, Pipes, Septic tanks, Overlying proprietor, Easements, Impoundments, Drainage, Adjudication procedure, Damages, Flood damage.

Plaintiff owned land adjacent to defendant. Defendant's land was situated lower than plaintiff's, and surface water in its natural course flowed from plaintiff's land on and across defendant's property. Defendant filled in and raised the grade of her lot, thereby obstructing the natural flow of surface water. This obstruction caused the water to accumulate and flood plaintiff's lot after every unusually heavy rainfall. Plaintiff sought to recover damages which resulted from such flooding. The court stated that a lower estate is subject to an easement of receiving the natural flow of surface water from an upper estate and that an owner of a lower estate has no right to create obstructions which interfere with such natural flow. However, the court ruled that since defendant's structure was permanent, there could be but one recovery for past, present, prospective or contingent damages. The action for such damages had to be brought within the applicable statute of limitations. Plaintiff failed to so bring his action and was therefore barred from recovery. (Barnett-Florida)

CITY OF COVINGTON V STATE TAX COMM'N (ASSESSMENT OF SUBMERGED LAND FOR TAXING PURPOSES).
231 Ky 606, 21 SW2d 1010-1018 (1929).

Descriptors: *Kentucky, *Boundaries (Property), *Taxes, *Beds under water, Bridges, Low water mark, Cities, Thalweg, Boundary disputes, Assessments, Judicial decisions, Legal aspects, State governments, Administrative agencies, Administration, Ohio, Tidal waters, Navigable waters, Banks, Riparian rights, Riparian land, Ownership of beds.
Identifiers: Covington (Kentucky).

Plaintiffs brought suit to enforce assessment of defendant city's land to collect taxes covering the cost of building bridges that serviced defendant municipal corporation. A dispute arose as to how much of defendant's land bordering on the Ohio River was in fact assessable for tax purposes. Plaintiff alleged that the corporate limits extended to the thread of the stream bounding defendant city. Defendant, relying on its charter and grant, alleged ownership in assessable lands extended solely to the low water mark of the river. The court stated that where deeds call for boundary line with physical dimensions, such as a road, street, stream or watercourse, individuals and municipal corporations own to the center of the physical line or thread of the stream, unless such boundary is a stream in which the tide ebbs and flows. There being no ebb or flow in the instant case, the court held that the assessable property extended to the center of the stream. (Barnett-Florida)
W71-02127

KERBY V PRAIRIE PIPE LINE CO (INJURY TO CATTLE CAUSED BY OIL POLLUTION OF WATER).

11 SW2d 758-759 (Mo 1928).

Descriptors: *Missouri, *Pipelines, *Oil, *Water pollution, Pollution sources, Cattle, Judicial decision, Legal aspects, Damages, Remedies, Surface waters, Streams, Dams, Water pollution effects, Water pollution sources, Adjudication procedure, Oil industry, Pollution.

Plaintiff owned land through which a stream flowed. Defendant corporation engaged in the transportation of crude petroleum. At a point above plaintiff's lands where defendant's pipes crossed the stream, the pipes burst, causing the oil to flow into the stream and subsequently onto plaintiff's lands. Defendant attempted to remove the oil from the stream by burning it and burying the excess slag in the banks of the stream. Plaintiff's cattle, grazing and watering in a portion of the stream, were injured as a result of drinking the polluted water. Plaintiff alleged that defendant's negligent maintenance of the pipeline had permitted the pipe to break. The court held that defen-

dant's demurrer should be sustained in that there was no evidence of negligence on the part of the defendant. (Barnett-Florida)
W71-02128

FORDSON COAL CO V PLEASNICK (LIABILITY FOR DAMAGE FROM OVERFLOW CAUSED BY EXTRAORDINARY RAINS).
215 Ky 794, 287 SW 11-12 (1926).

Descriptors: *Historic flood, *Kentucky, *Floods, *Flood damage, Flood control, Maximum probable flood, Design flow, Discharge (Water), Flood protection, Floodwater, Overflow, Rain, Rain water, River flow, Streamflow, Streams, Storm runoff, Bridges, Bridge construction, Legal aspects, Judicial decisions, Excess precipitation.

Plaintiff purchased a tract of land immediately above a railroad bridge which was erected across a stream. Defendant coal company then constructed two bridges across the stream immediately below the railroad bridge. Subsequent to such construction, a flood occurred which damaged plaintiff's property. Plaintiff brought an action for damages upon the theory that defendant had negligently constructed its bridge across the stream, thereby obstructing the natural flow of the water from ordinary rainfall and causing the stream to overflow. Witnesses testified at the trail that the rains and flood were unusual and extraordinary. The Kentucky Court of Appeals reversed the trial court's judgment for plaintiff. The court held that one constructing a bridge over a stream is not liable for damages from overflows caused by such extraordinary rains or floods as could not have been anticipated. (Powell-Florida)
W71-02129

CHESAPEAKE AND O RY V RICE (LIABILITY FOR DAMAGE TO LAND FROM DRAIN OBSTRUCTION).
221 Ky 695, 299 SW 565 (1927).

Descriptors: *Kentucky, *Alteration of flow, *Obstruction to flow, *Diversion, Water rights, Railroads, Drains, Legal aspects, Judicial decisions, Ditches, Surface water, Drainage water, Surface drainage, Right-of-way, Watercourses (Legal), Natural flow, Diversion structures, Adjudication procedure.

Plaintiff owned property that abutted defendant railroad's right-of-way. Defendant constructed a ditch along its right-of-way and diverted water into the ditch which formerly flowed in an opposite direction. Plaintiff brought an action for damages which resulted from such changes in the natural flow. Plaintiff alleged that the ditch was not of sufficient size to allow proper drainage and that in times of ordinary rainfall water flowed and stood upon plaintiff's property. Plaintiff further alleged that defendant was negligent in permitting the ditch to become obstructed. Witnesses at the trial failed to give any estimate of the value of the property destroyed or any estimate of the diminution in the value of the use of the property caused by the overflow. The Court of Appeals of Kentucky reversed the lower court's judgment for plaintiff. The court held that the verdict against defendant railroad was excessive because of the vagueness and uncertainty of the evidence supporting it. (Powell-Florida)
W71-02130

WINCHESTER WATER WORKS CO V HOLLIDAY (WATER COMPANY'S LIABILITY FOR DAMAGES RESULTING FROM BUILDING OF A FLASHBOARD DAM).
241 Ky 762, 45 SW2d 9-11 (1932).

Descriptors: *Kentucky, *Reservoirs, *Dam failure, *Flooding, Public utilities, Dams, Flood control, Damages, Remedies, Crops, Farms, Judicial decisions, Legal aspects, Lakes, Streams, Surface waters, Spillways, Surplus water, Impounded waters, Construction, Natural flow, Rainfall.

Plaintiff landowners sued defendant water company for damages from a flood caused by the breaking of a flash dam built and operated by defendant. Defendant had built two artificial lakes as reservoirs. One of these lakes was created by building a dam across an existing creek. To increase the impoundment of waters behind the dam in the dry season, defendant built a temporary flashboard dam across the top of the permanent dam, thereby increasing the dam's height by fifteen inches. Plaintiffs alleged that defendant's negligent construction of the flashboard dam was the cause of the flooding to their property. Defendant contended that the dam was not negligently built, but was intended to wash-out at times of heavy rainfall. The court found no evidence of negligence but held that defendant, as an upper proprietor had no right to impound waters and then to release them suddenly upon the lands of lower proprietors. Defendant could not, without liability construct a device that would give way automatically during a flood. (Barnett-Fla)
W71-02131

BOARD OF TRUSTEES OF TOWN OF AUBURN V CHYLE (CITY NOT LIABLE FOR FLOODING CAUSED BY STREET DRAINAGE).
256 Ky 283, 75 SW2d 1039-1041 (1934).

Descriptors: *Kentucky, *Surface runoff, *Riddance (Legal aspects), *Road construction, Roads, Drains, Sewers, Water injury, Flooding, Cities, Local governments, Surface waters, Natural flow, Rainfall, Rain water, Runoff, Grading, Drainage water, Judicial decisions, Legal aspects, Damages.
Identifiers: Auburn (Kentucky).

Plaintiff landowner brought action to recover damages caused by defendant city's alleged negligence in repairing streets and drains. As a result of the negligence, plaintiff's property was flooded when it rained. Plaintiff contended that defendant had a duty to maintain its streets and drains so as not to collect and discharge surface water onto landowners' property. Defendant contended that plaintiff's property had always flooded when it rained and that the street repairs did not change the natural flow of surface water. Reversing a judgment for plaintiff, the court held that plaintiff had failed to show that defendant's street repairs had changed natural conditions and caused flooding. The court noted that landowners are subject to the natural flow and drainage of surface water and could not complain unless the quantity or direction of flow had been changed by another. (Liptak-Fla)
W71-02132

BABER V GRIGGS (LIABILITY FOR DIVERTING SURFACE WATER FROM ROADWAY ONTO ADJACENT LAND).

252 Ky 816, 68 SW2d 419-421 (1934).

Descriptors: *Kentucky, *Roadbanks, *Surface runoff, *Repulsion (Legal aspects), Roads, Erosion control, Grading, Highways, Road construction, Slopes, Road design, Access routes, Diversion, Diversion structures, Drainage water, Drainage effects, Surface waters, Judicial decisions, Washouts, Adjudication procedure.

Plaintiff and defendant owned adjoining farms. Defendant's only means of ingress and egress was a small road through plaintiff's property to the public highway. Plaintiff brought a damage action claiming that defendant had built elevations in the road and thus diverted drainage water from the road onto plaintiff's land. Defendant contended that he had only repaired the elevations which were built 15 years before along with the road, that without them the road would wash out and be useless, and that plaintiff was precluded from complaining of the elevations because of their existence and repeated repair for so many years. The court affirmed a judgment for defendant, finding no error in the lower court's rulings or jury instructions. (Liptak-Fla)

KELLEY ISLAND LIME AND TRANSPORT CO V CITY OF CLEVELAND (LIABILITY FOR OBSTRUCTION OF NAVIGABLE WATERCOURSES).
47 F Supp 533-545 (ND Ohio 1942).

Descriptors: *Ohio, *Admiralty, *Navigable waters, *Remedies, Rivers, Construction, Bridges, Accidents, Contracts, Mechanical equipment, Obstruction to flow, Navigable rivers, Legislation, Damages, Judicial decisions, Legal aspects, Navigation, Ships, Highways, Cities.
Identifiers: *Obstruction to navigation.

Libel was brought against the City of Cleveland for negligently obstructing a navigable waterway within its city limits. Libelant ship was lawfully navigating a river when it struck a hidden obstruction in the river and sank. Libelant alleged that libelee city was charged by statute to keep the highways free of obstruction and that since a navigable river was a public highway, libelee should be liable. The court rejected this claim and found that a navigable river was not a public highway within the meaning of the statute. However, the court held that libelee could be held liable because, while engaged in its statutory function of caring for bridges, aqueducts, and viaducts, it caused an obstruction to be placed in the river and left it there without properly marking it. The mere placing of an obstruction in a navigable stream without warning in and of itself constituted negligence and gave rise to liability for the resulting injury to libelant. (Barnett-Fla)

METROPOLITAN PLANNING AND IMPLEMENTATION,
Metropolitan Council of the Twin Cities, Minn.
Robert C. Einsweiler.
Proceedings, American Society of Civil Engineers, Journal of the Urban Planning and Development Division, Vol 96, No UP2, p 113-121, October 1970. 2 fig.

Descriptors: *Planning, *Governments, City planning, Land use, Administration, Inter-agency cooperation.
Identifiers: *Metropolitan planning, Public policy, *Implementation, Policy, Professional practice.

Governmental decision-making in metropolitan areas is gravitating toward more comprehensive, area-wide, policy-oriented organizations and creating new roles for engineers. The new Metropolitan Council has its roots in the Minneapolis-Saint Paul Sanitary District created in 1933. The Council represents an evolution in geographic scope from two central cities to seven counties; and in method of representation from local elected officials to metropolitan district representatives. In authority, it combines regional planning with operating subordinate boards, the successors to independent metropolitan authorities. In the process, the role of the engineer has changed. He now participates as a member of a multidiscipline team in recommending regional development policy to the Metropolitan Council and continues more typical engineering roles with subordinate boards in the design, construction and operation of metropolitan public works. Similar changes, though less advanced are occuring across the nation. Engineers should see this as an opportunity to improve the democratic process. The alternative of technocracy is not a professionally responsible approach. (Davis-Chicago)

LITTLE FALLS FIBRE CO V HENRY FORD AND SONS (LIABILITY OF LICENSEE FOR MAINTENANCE OF FLASHBOARDS ON FEDERAL DAM).

126 Misc 126, 212 NYS 630-638 (1925).

Descriptors: *New York, *Dams, *Overflow, *Flood damage, Leases, Spillway crests, Spillway gates, Spillways, Federal government, Judicial decisions, Legal aspects, Dam construction, Dam design, Public benefit, Hydraulic structures, Hydroelectric plants, Navigation, Riparian rights, Water rights, Impoundments, Backwater, Relative rights, Competing uses.

Defendant motor company, pursuant to a government lease, constructed a hydraulic powerplant on lands adjoining a federal dam and installed flashboards on the main spillway of the dam. Consequently, the elevation of water on the land of plaintiff manufacturing company was raised, causing damage to its property and water power. Plaintiff brought an action seeking removal by defendant of the flashboards installed on the dam. Defendant contended that it was acting as an agency of the federal government which was authorized to maintain and erect flashboards for the benefit of interstate commerce. Plaintiff contended that defendant erected the flashboards to aid operation of its powerplant. The court, in ordering removal of the flashboards, stated that the federal government, in the interest of navigation, could lawfully maintain flashboards on the dam spillway. However, where maintenance of flashboards by defendant licensee for the purpose of improving its water power plant operation was the cause of damage, maintenance thereof was without justification. (Powell-Florida)

CORBY V RAMSDELL (OBSTRUCTION TO NAVIGATION AS PUBLIC NUISANCE).
48 F2d 701-704 (2d Cir 1931).

Descriptors: *New York, *Admiralty, *Ships, *Navigation, Rocks, Charts, Harbors, Shoals, Warning systems, Navigable waters, Ownership of beds, Damages, Rock foundations, Boats, Shallow water, Channels, Judicial decisions, Legal aspects, Adjudication procedure, Accidents.

Libelant yacht owner brought libel against respondent owner of submerged land for damages to libelant's yacht which resulted from striking submerged rocks on respondent's land. Respondent's predecessor in interest had begun construction of a pier on the tidelands; it was never completed and fell into disrepair, with foundation rocks lying just beneath the surface of the water. Charts indicated the pier and gave water depth from 3 to 8 ft. Libelant's yacht, drawing 4 ft., was run at 26 m.p.h. over the rocks by an unfamiliar master who did not examine the chart. There was a passable channel available. Libelant asserted that the pier was a public nuisance of which respondent had notice. Respondent contended that it was not liable since there was no request to abate the nuisance. The court stated that the rule which requires a request to abate applies only to private nuisance, and noted that no one could maintain a public nuisance with notice without incurring liability. The yacht's passage outside the channel in itself was determined not to relieve respondent from liability. However, the court held that libelant was contributorily negligent, and apportioned the damages awarded. (Hart-Florida)

BURKE V SOUTHERN BELL TEL AND TEL CO (LIABILITY OF UTILITY COMPANY FOR OBSTRUCTION OF RIVER).
55 F2d 732-733 (SD Ala 1932).

Descriptors: *Alabama, *Public utilities, *Boats, *Navigation, Utilities, Bridges, Transportation, Water rights, Judicial decisions, Legal aspects, Rivers, Damages, Remedies, Regulation, Federal government, Floods.

Defendant telephone company stretched wires across a river near a bridge. The wires' location permitted clearance of river steamers' smokestacks even in floodwaters. Subsequently defendant, without federal permission, placed additional wires across the river two feet lower than those originally placed. Plaintiff boat captain knew of the existence and location of the original wires, having passed under those wires during floodwater. In attempting to pass under the bridge during subsequent flood conditions, the boat suffered damages when the additional wires caught plaintiff's boat's smokestacks. Plaintiff brought an action for damages, alleging that defendant was negligent in placing the additional wires. Defendant contended that plaintiff was negligent because of his knowledge of the wires and his failure to ascertain the clearance between the water and the wires. The court held that since all wires were strung without authorization, they constitued an obstruction of the stream for which defendant was liable. The court stated that plaintiff, not knowing that additional wires which were lower than original wires had been placed across the river, was not negligent in attempting to pass under the bridge during floodwaters. (Powell-Florida)

AKTIESELSKABET DAMPSKIB GANSFJORD V UNITED STATES (SHIP MAY BE SUBJECT TO LIBEL IN COURT OF LAW FOR DAMAGE TO LAND OBJECT).
32 F2d 236-237 (5th Cir 1929).

Descriptors: *Louisiana, *Jetties, *Ships, *Admiralty, Rivers and Harbors Act, Legal aspects, Judicial decisions, Remedies, Damages, Legislation, Federal government, Coastal structures, Sea walls, Mississippi River, Navigable waters, Land, Jurisdiction.
Identifiers: *Libel.

Plaintiff federal government brought action in libel against the claimants of the steamship Gansfjord for damage allegedly caused when the ship ran into a jetty in the Mississippi River. Defendant contended that since a court of admiralty would not recognize the suit, because a jetty is considered land and there would be no right of action, the federal district court should not have entertained it. The Court of Appeals, Fifth Circuit, in affirming a judgment for plaintiff, held that the Rivers and Harbors Act of 1899 authorized an action for impairing the usefulness of jetties. The mere fact that a court of admiralty will not recognize the suit because a land object was involved does not mean a court of law cannot handle it. Law courts also recognize remedies against an object, such as the ship, which is used to violate a law. The ship was liable for the damage. (Morris-Florida)

UNITED STATES V NORFOLK-BERKLEY BRIDGE CORP (LIABILITY OF BRIDGE COMPANY FOR OBSTRUCTING NAVIGATION).

29 F2d 115-132 (ED Va 1928).

Descriptors: *Virginia, *Bridge construction, *Rivers and Harbors Act, *Admiralty, Legal aspects, Judicial decisions, Damages, Federal government, Navigable waters, Transportation, Ships, Boats, Bridge design, Disasters, Bridges, Legislation, Navigation, Rivers, Permits, Administrative agencies, Adjudication procedure, Relative rights.

The federal government and a bridge company filed in admiralty to recover from a limitation of liability fund established by a towing company whose tugboats were pulling the government's ships in two separate collisions between the ships and a bridge. The government and the towing company alleged that the bridge company was negligent and that it violated the Rivers and Harbors Act's provisions against obstructing navigation by allowing quadrant gears to overhang a passageway between the bridge's fenders. The federal district court agreed, but also found that the towing company had been negligent because it had warning of the dangerous condition but proceeded to navigate the ships in a manner which led to collisions between the overhanging quadrant gears and the ships' superstructures. The court held that the bridge company could recover from the remainder of the towing company's liability fund despite its negligence since admiralty, in contrast to common law, allows awards based on comparative negligence. The court found that Congress intended such recoveries, even though the bridge company would not have a right of action at common law, in setting up the limitation of liability fund requirements. (Morris-Florida)
W71-02163

THE GANSFJORD (SHIP SUBJECT TO LIBEL FOR DAMAGING JETTY).
25 F2d 736-738 (ED La 1928).

Descriptors: *Louisiana, *Rivers and Harbors Act, *Jetties, *Ships, Disasters, Legal aspects, Judicial decisions, Remedies, Damages, Legislation, Federal government, Navigation, Coastal structures, Sea walls, Admiralty, Mississippi River, Fog, Navigable waters, Channels, Land, Federal jurisdiction, Jurisdiction.

Libellant federal government filed an action in libel against a ship which crashed into a jetty in the Mississippi River. The government claimed the ship violated the Rivers and Harbors Act which prohibited impairment of jetties. Claimant attacked the constitutionality of the Act, which provided a libel remedy in the district court, as an encroachment of admiralty juridiction and also claimed that negligence had not been proven. The district court overruled exceptions and granted a decree for libellant, holding that the Constitution does not bar Congress from distributing admiralty jurisdiction. The court stated that Congress wanted to provide protection for shore properties by admiralty liens since admiralty would not recognize actions involving shore properties and the law remedy was inadequate. The court also held the ship was operated in gross negligence since it was proceeding at full speed in a dense fog in a narrow channel, but added that negligence was not necessary under the language of the Rivers and Harbors Act. (Morris-Florida)
W71-02164

THE GEORGIE (LIABILITY FOR DAMAGE FROM INJURY TO SUBMARINE COMMUNICATIONS CABLE).
14 F2d 98-100 (9th Cir 1926).

Descriptors: *Admiralty, *Anchors, *Electric cables, *Damages, Ships, Communication, Legislation, Judicias, Legal aspects, Navigation, Regulation, Adjudication procedure, Remedies.

Plaintiff United States brought libel against defendant vessel for injury to plaintiff's submarine communications cable. Defendant anchored and snagged the cable, thereby causing the injury. Plaintiff had given no notice of the cable's location, and it was not plotted on marine charts. Plaintiff contended that defendant had imputed knowledge of the cable location and that defendant was negligent per se by anchoring in contravention of area anchoring regulations. The court held that defendant did not have imputed knowledge of the cable location, concluding the plaintiff was required to give notice of its location. Plaintiff's assertion of negligence per se was rejected, the court pointing out that the primary purpose of the anchoring regulations was to ensure safe surface navigation rather than protection for submarine cables. The lower court's decision for plaintiff was reversed. (Hart-Florida)

W71-02165

GULF STATES STEEL CO V LAW (LIABILITY FOR FLOOD DAMAGE BY DAM OWNER).
141 So 641-645 (Ala 1932).

Descriptors: *Alabama, *Obstruction to flow, *Dams, *Natural flow doctrine, Streams, Overflow, Judcial decisions, Legal aspects, Damages, Creeks, Dam construction, Rainfall intensity, Crop response, Natural flow, Backwater, Diversion, Diversion losses, Diversion dams, Easements, Riparian land, Riparian rights, Riparian waters, Relative rights, Reasonable use.

Plaintiff landowner brought action to recover damages for crop destruction by water caused by a dam constructed by defendant corporation across a creek on which plaintiff's property was located. Defendant contended the injury was caused by unusual rainfall and would have resulted even in the absence of its dam. The Supreme Court of Alabama stated that a landowner may maintain a dam across a natural stream for reasonable purposes but cannot impound water in such quantities as to make the stream flood others' lands. The court ruled that plaintiff had the right to have the stream flow in its natural course, that defendant's dam had caused the water of the stream to back up onto plaintiff's property and that plaintiff was entitled to damages for the injury caused thereby. The trial court's judgment for plaintiff was affirmed. (Price-Florida)
W71-02166

PEMBROOKE V PENINSULAR TERMINAL CO (POWER OF STATE TO DISPOSE OF SUBMERGED LAND).
146 So 249-264 (Fla 1933).

Descriptors: *Florida, *Navigable waters, *Ownership of beds, *Land tenure, Beds, Tidal waters, Water levels, Federal government, Federal jurisdiction, State jurisdiction, State governments, Navigation, Channels, Islands, Bays, Overflow, Riparian rights, Administrative agencies, High water mark, Low water mark, Shores, Dredging, Tides, Judicial decisions, Legal aspects, Public rights.

Complainant corporation sought to obtain the balance of money owed to it by defendant for land purchased. The land was located on an island which had originally been submerged bottom land. Defendant denied that complainant could convey good title and sought rescission and return of money already paid. The trial court struck defendant's allegations for affirmative relief and the Supreme Court of Florida affirmed. Defendant's contention that the statutes under which the land was originally sold were void was without merit. Such statutes were not unconstitutional, did not interfere with the public's interest in navigation, fishing and other purposes and were not in conflict with the paramount jurisdiction of the federal government over navigable waters. Defendant's contention that the original deed from the state trustees was void because the submerged land was under too great a depth of water was also rejected. Such a contention amounted to a collateral attack upon the grant by the trustees, and such an attack is not permissible in a suit between private parties. Finally, defendant's contention that the federal government's power to remove obstructions from navigable waters consituted an encumbrance to the title was without merit. Such power was not an encumbrance which warranted rescission of the contract. (Duss-Florida)
W71-02167

STATE EX REL LANDIS V ROSENTHAL (EXCLUSIVE FRANCHISE FOR BRIDGE OPERATION).
148 So 769-776 (Fla 1933).

Descriptors: *Florida, *Permits, *Bridges, *Bridge construction, Legislation, State governments, Local governments, Navigable waters, Beds under water, Highways, Federal government, Administrative agencies, Administrative decisions, Remedies, Judicial decisions, Legal aspects, Public rights.

Defendant had been granted an exclusive franchise to build and operate a toll bridge over navigable state waters. The franchise was conditioned on approval by the state road department and the United States War Department. In an action of quo warranto, the state sought the ouster of defendant from the project on the grounds that such an exclusive franchise was beyond the authority of the statute allowing private licenses for such projects to be granted. The Supreme Court of Florida, holding that navigable waters and lands underlying them are held by the state in trust for its citizens, granted the petition for ouster. The court also ruled that when the state delegated its power to the county, certain limitations on the power were inherent in the grant. Disallowance of the ability to create an exclusive franchise was such a limitation. (Barker-Florida)

CITY OF SHREVEPORT V WILKINSON (CONSTITUTIONALITY OF ORDINANCE DENYING ACCESS TO LANDOWNER'S HOME).
182 La 783, 162 So 621-622 (1935).

Descriptors: *Louisiana, *Water supply, *Supervisory control (Power), *Cities, Local governments, Governments, State governments, Federal government, Legal aspects, Judcial decisions, Lakes, Land, Real property, Water pollution, Legislation, Water pollution control, Adjudication procedure, Navigable waters, Regulation.

Defendant was arrested pursuant to a city ordinance prohibiting passage of boats on a lake at night. The state had conveyed the bed of the lake to plaintiff city and delegated to the city the right to enforce regulations to protect the lake's water from contamination as a water supply. Defendant had erected a recreation home on an island in the lake and was arrested while conveying guests to the shore. Defendant contended that the city ordinance was unconstitutional as an unreasonable exercise of the police powers of the state. The Supreme Court of Louisiana affirmed a judgment for defendant. The ordinance was valid on its face as a reasonable exercise of the delegated power to protect the water supply. However, its rigid enforcement against a landowner, denying him access to his home, was unreasonable. Boats were not prohibited from traversing the lake in the daylight hours and little could be gained by prohibiting passage by defendant at night. (Dye-Florida)
W71-02169

ILHENNY V BROUSSARD (DIVERSION OF WATERS FROM NAVIGABLE STREAMS).
172 La 895, 135 So 669-670 (1931).

Descriptors: *Louisiana, *Diversion, *Navigable waters, *Alteration of flow, Obstruction to flow, Remedies, Legal aspects, Adjudication procedure, Judicial decisions, Navigation, Navigable waters, Streams, Canals, Structures, Flow, Natural streams, Running waters, Public rights, Watercourses (Legal).

Plaintiff sought to enjoin defendant from using his private navigable canal. Defendant contended that plaintiff had diverted so much water into his canal from a previously navigable watercourse that the watercourse was no longer navigable. Defendant contended that plaintiff's diversion authorized the public to make free use of the waters in their new artificial channel. Plaintiff contended that the navigability of the natural stream was in no way diminished. The Supreme Court of Louisiana affirmed a judgment for plaintiff. Plaintiff's canal was private, and defendant was not authorized to trespass on it. If the natural watercourse had in fact been rendered non-navigable, plaintiff might have been enjoined from further diversion. Defendant's proper remedy was appealed to the Secretary of War, whose powers included regulation of navigable streams, or a suit to enjoin plaintiff from diverting so much water as to impede the navigability of the natural watercourse. (Dye-Florida)

FLORIDA EAST COAST RY V ACHESON (LIABILITY FOR OBSTRUCTION TO NAVIGATION).
135 So 551-553 (Fla 1931).

Descriptors: *Florida, *Accidents, *Ships, *Navigable waters, Adjudication procedure, Legal aspects, Hazards, Judicial decisions, Admiralty, Oceans, Piles (Foundations), Structures, Railroads, Damages.

Plaintiff ran his boat into a piling in a navigable channel. Plaintiff sought damages, introducing evidence that defendant railroad had placed pilings in the channel 16 years prior to the accident. The Supreme Court of Florida reversed a judgment for plaintiff. The court stated that some negligence on the part of defendant had to be shown which directly contributed to the injury complained of. The court held that evidence that defendant once placed pilings in the channel was not sufficient to sustain a verdict for plaintiff without a showing that it was one of defendant's pilings which was encountered. (Dye-Florida)
W71-02171

VOLENTINE V HOUSEMAN (LIABILITY FOR OBSTRUCTING DRAINAGE DITCH).
130 So 863-864 (La 1930).

Descriptors: *Louisiana, *Ditches, *Surface drainage, *Obstruction to flow, Legal aspects, Judicial decisions, Damages, Drainage, Surface waters, Surface runoff, Channels, Channel flow, Flow, Crops, Erosion, Overflow, Culverts, Riddance (Legal aspects), Highways.

Plaintiff landowner sued for damage to his land and crops allegedly caused when defendant landowner obstructed a ditch, thereby causing surface water to overflow plaintiff's land. Defendant denied that the overflow was his fault. Plaintiff's land was lower than defendant's, and the two tracts were separated by a street. A natural drain had been converted into a ditch which carried surface water through defendant's land and through a culvert under the street. A continuation of the ditch carried the water from plaintiff's land. The Court of Appeal of Louisiana, in affirming a judgment for plaintiff, found that defendant, in clearing his land of lumber and brush, had placed the debris in his ditch and it clogged the culvert, causing water to flow over the street rather than through the ditch and to flood plaintiff's land. Defendant thus was liable for obstructing the natural flow since an upper proprietor may not increase the burden of the servitude of a lower estate. (Morris-Florida)
W71-02172

SCRANTON-PASCAGOULA REALTY CO V CITY OF PASCAGOULA (ARTIFICIAL CHANNEL MAY BECOME WATERCOURSE BY PRESCRIPTION).
128 So 73-76 (Miss 1930).

Descriptors: *Mississippi, *Watercourses (Legal), *Artificial watercourses, *Culverts, Channel improvement, Legal aspects, Judicial decisions, Remedies, Bayous, Cities, Local governments, Legislation, Channels, Channel flow, Concrete structures, Drainage systems, Drainage, Prescriptive rights.

Plaintiff landowner sought an injunction against defendant city to prevent construction of an enlarged culvert beneath a city street. Plaintiff, whose land would be damaged by discharge from the concrete culvert, claimed it violated a statute which allowed the city to change the channels of watercourses only after voter approval. Defendant contended

that the culvert was not a watercourse and that it was not changing the channel. The Supreme Court of Mississippi, in reversing a lower court disallowance of the injunction, found that the old culvert was constructed by a ship building company as a drainage substitute when it filled in part of the adjoining bayou. It was thus originally an artificial channel, but by prescription had become a watercourse. The new culvert would be larger and carry a greater volume of water, thus amounting to a change of the channel. This the city could not do under the statute. (Morris-Florida)
W71-02173

MARTIN V LOUISIANA PUB UTIL CO (RIGHTS OF PARTIES UNDER WATER CONTRACT).
127 So 470-472 (La 1930).

Descriptors: *Louisiana, *Contracts, *Water contracts, *Prescriptive rights, Sewers, Contract administration, Judicial decisions, Legal aspects, Drainage, Drains, Sewage, Aqueducts, Conduits, Waste water disposal, Utilities.

Plaintiff brought action for the restoration of services from defendant utilities company on the theory that he had acquired by prescription the servitude of draining the refuse water from his private residence through a sewer owned by defendant. Plaintiff contended that in years past he had contracted with defendant's predecessor for the use of the sewer for drainage on the condition that he would buy his water from defendant's predecessor, that he had complied with the contract and that therefore he had obtained a servitude on the sewer now owned by defendant. Defendant denied such an agreement and any resulting prescriptive right. The court ruled that plaintiff had simply had a contract with the predecessor of defendant, that defendant had assumed no obligation thereunder and that plaintiff could not have obtained a prescriptive right as claimed under the contract. The judgment for defendant was affirmed. (Price-Florida)
W71-02174

BAKER V VOSS (TITLE TO BEDS OF NAVIGABLE WATERS).
259 NW 413-415 (Wis 1935).

Descriptors: *Wisconsin, *Ownership of beds, *Navigable waters, *Access routes, Public rights, Lakes, Streams, Boundaries (Property), Beds, Beds under water, State governments, Riparian rights, Relative rights, Remedies, Judicial decisions, Legal aspects.

Plaintiffs sought to enjoin defendant from interfering with plaintiffs' access to an allegedly navigable lake which lay within the boundaries of defendant's land. The lake was joined to another, smaller lake by a shallow, narrow stream, and only a small portion of the second lake was outside of defendant's property. The neighboring landowners allowed the public to enter upon the smaller lake, but defendant erected a fence across the stream, thus preventing entry to the larger lake. The trial court found all the waters in question to be navigable and granted the injunction. Affirming, the Supreme Court of Wisconsin ruled that the state has title to the beds of all navigable waters, whether meandered or not. An injunction will lie against interference with the public rights in such navigable waters. (Barker-Florida)
W71-02175

ERICKSON V COUNTY OF STEARNS (LIABILITY OF COUNTY FOR DAMAGES FROM DAM OPERATION).
252 NW 219-221 (Minn 1934).

Descriptors: *Minnesota, *Dam construction, *Water levels, *Flood damage, Damsites, Dams, Operation and maintenance, Height, Lakes, Local governments, Legislation, Administrative agencies, Elevation, Jurisdiction, State jurisdiction, Land, Riparian land, Floods, Flooding, Remedies, Judicial decisions, Legal aspects.

Plaintiff riparian landowner brought an action for damages caused by defendant county's alleged improper maintenance of a dam on a certain lake. The major portion of the lake lay within another county, but a small part was within defendant's boundaries. Under Minnesota law, the state delegated its power over control of water levels in navigable waters to the several counties, and petition was made to defendant county to establish a dam to control the level in the portion of the lake within its boundaries. The dam was constructed by the state game and fish department, with defendant agreeing to pay half the costs. Plaintiff's property was flooded as a result of the dam, and the dam was removed when defendant required the game and fish department to do so. Defendant denied liability for plaintiff's damage under the doctrine of ultra vires. The trial court accepted the defense that defendant could not be liable since it had no authority over the dam's maintenance, and the case was dismissed. Affirming, the Supreme Court of Minnesota ruled that the legislature could not have attempted to give a county control over a lake, the major portion of which lay in another county. Therefore, defendant had no interest in the lake, and any attempt to exercise an interest was ultra vires. (Barker-Florida)
W71-02176

HAASE V KINGSTON CO-OPERATIVE CREAMERY ASS'N (OWNERSHIP OF LAND UNDER ARTIFICIAL LAKE).
250 NW 444-445 (Wis 1933).

Descriptors: *Wisconsin, *Ownership of beds, *Relative rights, *Land tenure, Beds, Beds under water, Dams, Damsites, Ponds, Ponding, Public rights, Recreation, Ice, Lake ice, Riparian rights, Artificial watercourses, Water utilization, Remedies, Judicial decisions, Legal aspects.

Plaintiff landowner sought to recover the value of ice taken by defendant from a pond on plaintiff's property. Plaintiff's predecessor had constructed a dam whereby the pond was created. The public had been allowed full access to the pond. Defendant argued that such public access had vested title to the lake and the land beneath it in the state by adverse possession, thus giving the public the right to harvest the ice. The Supreme Court of Wisconsin, in affirming the trial court's decision for plaintiff, ruled that a landowner may permit the public to enjoy an artificial body of water, and such allowance may ripen into a dedication which the owner may not abolish. However, such dedication does not constitute adverse possession in the state. Ownership in the lake and underlying property was held to remain in plaintiff, and recovery for the value of the ice was allowed. (Barker-Florida)
W71-02177

FLAMBEAU RIVER LUMBER CO V GETTLE (RIGHT OF LUMBER COMPANY TO HAVE RIVER NAVIGABLE FOR DRIVING LOGS).
236 NW 671-679 (Wis 1931).

Descriptors: *Wisconsin, *Lumbering, *Impounded waters, *Reservoirs, Alteration of flow, Discharge (Water), Legal aspects, Judicial decisions, Dams, Saw mills, Equalizing reservoirs, Navigation, Navigable rivers, Reservoir operation, Water levels, Administrative agencies, Riparian rights, Water rights.

The Railroad Commission, of which defendant was a member, issued an order authorizing the retention of all the flow of a river, except 150 cubic feet per second, during the time when logs were being driven upon said river. Plaintiff lumber company was forced to abandon its log drives. Plaintiff brought an action to have the Commission's order vacated, alleging that plaintiff was deprived of its right of navigation upon the river. Plaintiff also alleged that 1300 cubic feet of water per second was needed to conduct log drives. Defendant alleged that the Commission was empowered to control drawing of water from river reservoirs in order to maintain uniform flow. The Supreme Court of Wisconsin affirmed the lower court's decision vacating the Railroad Commission's order. The court held that plaintiff was entitled to water at times and in quantities necessary to make the river navigable for driving logs. The court also held that it was unauthorized to determine the quantity of water reasonably necessary in the river for log driving, such determination being an administrative matter. (Powell-Florida)
W71-02178

DELTA FISH AND FUR FARMS V PIERCE (STATUS OF WATERS PREVIOUSLY ADJUDGED NON-NAVIGABLE).
234 NW 881-886 (Wis 1931).

Descriptors: *Wisconsin, *Navigable waters, *Public rights, *Non-navigable waters, Adjudication procedure, Judicial decisions, Legal aspects, Relative rights, Land, Real property, Recreation, Hunting, Fishing, Diversion, Drainage districts, Streams, Rivers, Navigation.

Plaintiff muskrat framing company sought to restrain defendants from trespassing on its inundated land for the purpose of hunting and fishing. Defendants contended the water on plaintiff's land was navigable and therefore subject to public recreation. Plaintiff's property had formerly been covered by the waters of a navigable stream which had been diverted under an action brought by a local drainage district. The court in that action found that no navigable water would remain on plaintiff's property after the diversion. In reversing a judgment for defendants, the Supreme Court of Wisconsin held that the question of the navigability of the waters on plaintiff's property was res judicata. The proceeding brought by the drainage district was in rem and conclusive of all questions therein adjudicated. Some petitioners in the proceeding had argued the exact issue presented by defendants. Since the waters were adjudged non-navigable, no rights thereafter existed in the public to trespass on plaintiff's land. (Dye-Florida)
W71-02179

PFANNEBECKER V CHICAGO RI AND P RY (LIABILITY FOR DAMAGES RESULTING FROM TWO OR MORE CAUSES).
226 NW 161-164 (Iowa 1929).

Descriptors: *Iowa, *Obstruction to flow, *Adjudication procedure, *Damages, Remedies, Legal aspects, Judicial decisions, Flow, Floods, Flooding, Precipitation excess, Streams, Railroads, Alteration of flow, Bridges, Crops, Overflow, Banks, Flood damage, Rain water, Structures.

Plaintiff's property lay in a valley through which passed a stream. Defendant railroad constructed an embankment and bridge across the valley downstream from plaintiff. During a period of heavy rains, plaintiff's fields were flooded and his crops destroyed. Plaintiff brought action against defendant for damages, contending that the floodwaters were turned from their natural course by defendant's embankment and backed onto his property. The Supreme Court of Iowa reversed a judgment for plaintiff. Plaintiff's own evidence suggested that part of his damage resulted from normal overflow of the stream. Plaintiff was unable to segregate with any certainty the damage caused by defendant's embankment and that which would have otherwise occurred. Despite instructions by the trial judge that if any damage resulted from causes other than defendant's embankment plaintiff was not entitled to a verdict, the jury returned a verdict for plaintiff. The court held that the jury was in error. The extent of defendant's liability as established by plaintiff was too speculative to warrant a judgment. (Dye-Florida)
W71-02180

PIKE RAPIDS POWER CO V SCHWINTEK (SPECIFIC PERFORMANCE OF CONTRACT TO CONVEY FLOWAGE RIGHTS).
223 NW 612-614 (Minn 1929).

Descriptors: *Minnesota, *Dams, *Backwater, *Contracts, Design flood, Maximum probable flood, Land tenure, Real property, Flooding, Flood damage, Hydroelectric plants, Lumber, Judicial decisions, Legal aspects.

Plaintiff power company sought specific performance of a contract against defendant riparian landowner for the conveyance of certain flowage rights. Defendant's predecessor sold flowage rights to plaintiff over part of his land and agreed to convey flowage rights for any remaining land which might be overflowed for $50 an acre. The dam caused flowage over 35 more acres than originally conveyed, but defendant refused to convey the flowage rights for this additional land upon plaintiff's tender of the agreed price. Defendant contended that: (1) there was no meeting of the minds; (2) there was no consideration for the conveyance; (3) he adversely possessed the lands; and (4) specific performance would be inequitable. The court found that defendant had failed to sustain the burden of showing an inadequate meeting of minds. Defendant's contention of no consideration was rejected since the payment of $50 an acre for the additional land was obviously adequate consideration. Defendant's additional contentions were rejected as frivolous, and the lower court's decision for plaintiff was affirmed. (Hart-Florida)
W71-02181

BEAVERTON POWER CO V WOLVERINE POWER CO (BREACH OF ORAL CONTRACT TO CONVEY FLOWAGE RIGHTS).
222 NW 703-705 (Mich 1929).

Descriptors: *Michigan, *Dams, *Backwater, *Contracts, Design flood, Maximum probable flood, Land tenure, Real property, Flooding, Flood damage, Claims (Contracts), Hydroelectric plants, Damages, Compensation, Judicial decisions, Legal aspects, Adjudication procedure, Relative rights, Competing uses.

Plaintiff power company sought specific performance of an alleged contract with defendant power company to release flowage rights to certain riparian farmland. Defendant assured plaintiff that its dam would not back water to the point of the Weinboldt and Hunter farms, which were located across a river from one another. Defendant owned both farms. Relying upon defendant's assurance, plaintiff purchased the Hunter farm outright, and purchased the Weinboldt farm subject to defendant's flowage rights thereon. Plaintiff contended that defendant had agreed to release the Weinboldt flowage rights for $600. Defendant alleged that plaintiff had agreed to sell flowage rights on the Hunter farm if defendant's dam backed water over it. Both the alleged agreements were oral. The court determined that flowage rights were interests in land and could only be purchased by a written instrument under seal. Accordingly, the court refused to enforce the rights asserted by either party. However, the court awarded plaintiff more than the value of the land overflowed by defendant's dam since it was purchased with defendant's assurance that such land would not be overflowed. (Hart-Florida)
W71-02182

ANDERSON V OTTER TAIL POWER CO (LIABILITY FOR BREACH OF COVENANT TO PROVIDE POWER FROM DAM).
220 NW 404-406 (Minn 1928).

Descriptors: *Minnesota, *Dams, *Contracts, *Flooding, Judicial decisions, Legal aspects, Land tenure, Real property, Water supply, Water contracts, Dam construction, Damsites, Adjudication procedure.

Plaintiff landowner sued defendant power company for damages for breach of covenant. Plaintiff owned property containing a dam. Plaintiff sold the property to defendant's predecessor, who agreed to provide 20 horsepower to plaintiff from that dam or any future dam which might be built. Plaintiff continued to operate the dam, but permitted it to fall into disrepair. Defendant subsequently purchased the tract and built another dam downstream, flooding the old dam. Plaintiff contended that defendant was required by the covenant to erect a new dam on the original damsite. Plaintiff further alleged that flooding of the damsite created a right of damages and that defendant was required to provide the specified power from the lower dam. Defendant contended that the covenant did not run with the land and that it did not require erection of a new dam. The court refused to decide whether the covenant ran with the land since it held that the terms of the covenant clearly provided no obligation to build a new dam. The court also determined that the covenant did not create a right of damages or right to water power. The lower court's decision for plaintiff was reversed. (Hart-Florida)
W71-02183

CITY OF BARABOO V RAILROAD COMM'N (JUDICIAL REVIEW OF ADMINISTRATIVE ORDER TO LOWER DAM HEIGHT).
218 NW 819-820 (Wis 1928).

Descriptors: *Wisconsin, *Dams, *Administrative agencies, *Legislation, Water levels, Power head, Height, Tailwater, Water level fluctuations, State governments, Cities, Judicial decisions, Legal aspects, Adjudication procedure, Administrative decisions, Regulation, Supervisory control (Power), Navigable waters.

Plaintiff city brought action to set aside an order of defendant commission requiring plaintiff to lower its dam two inches. The dam was authorized by legislation. Among other things, plaintiff contended that it had a right to maintain a 14 ft. dam, whereas the dam which defendant had ordered lowered was only 12 1/2 ft. high. To establish this contention, plaintiff had offered evidence that the dam was higher at a time before the authorizing legislation for the present dam was enacted, but the trial court refused to consider this evidence. The Supreme Court of Wisconsin pointed out that even if the higher level were established, plaintiff could only maintain the waterhead the legislature authorized. A state may refuse permission to a riparian owner to build a dam in a navigable stream or it may attach conditions to its consent. The court held that defendant's order was proper and affirmed the lower court's decision for defendant. (Hart-Florida)
W71-02184

ANGELO V RAILROAD COMM'N (CONSTITUTIONALITY OF CONTRACT TO REMOVE MARL FROM LAKEBED).
217 NW 570-577 (Wis 1928).

Descriptors: *Wisconsin, *Contracts, *Riparian rights, *Ownership of beds, Beds under water, Legislation, Navigable waters, Lakes, Administrative agencies, Administrative decisions, State governments, Eminent domain, Permits, Lake beds, Lake soils, Navigation, Marl, Calcareous soils, Calcium compounds, Caliche, Grants, Judicial decisions, Legal aspects.

Plaintiff littoral landowners brought action to have the acts of defendant Railroad Commission which granted a right to remove marl from a navigable lake declared unconstitutional. Defendant was authorized by legislation to contract for removal of material from navigable lake beds and to determine compensation to be paid the state therefor. Plaintiffs contended that any removal contract would unconstitutionally violate their riparian rights. The court noted that: (1) the state constitution declared a public trust in navigable waters for navigation, but not to the land thereunder; (2) a riparian owner on a navigable lake does not hold title to the lakebed, because title to such beds is in the state; (3) in absence of a legislative declaration, whether a lake is navigable is a fact question; and (4) the state may only destroy riparian rights through exercise of the eminent domain power. Since the littoral landowners did not have title in the lakebed, the court concluded that the statute was not an improper exercise of the police power and held that defendant could properly execute a contract for removal of marl without violating plaintiffs' riparian rights. However, the lower court's decision for defendant was reversed on other grounds. (Hart-Florida)
W71-02185

MILLER V PERKINS (OBSTRUCTION OF SURFACE RUNOFF).
216 NW 27-29 (Iowa 1927).

Descriptors: *Iowa, *Diversion, *Obstruction to flow, *Surface runoff, Natural flow, Natural flow doctrine, Culverts, Ditches, Judicial decisions, Legal aspects, Diversion structures, Diversion dams, Drainage, Overflow, Right-of-way, Railroads, Tile drains, Backwater, Crop response, Surface drainage.

Plaintiff sought to enjoin defendant from obstructing the natural flow of surface runoff from plaintiff's dominant estate. Defendant had constructed a ditch between the two pieces of property to prevent the overflow from coming onto his property. The parties stipulated that the ditch should have been maintained so as not to cause water to be backed up onto plaintiff's property. There was disagreement as to just how said ditch was to be maintained. Defendant's tenant had constructed a dam that also caused water to back up to plaintiff's injury, but did so only when defendant's ditch was improperly maintained. The court ruled that defendant could prevent the surface water from flowing over his property if in doing so he did not prejudice plaintiff. The case was remanded to have determined the issue of the sufficiency of defendant owner's ditch and to consider the need for enjoining the maintenance of defendant's tenant's dam. (Price-Florida)
W71-02186

CITY OF MILWAUKEE V STATE (SALE OF SUBMERGED LANDS TO AID NAVIGATION).
214 NW 820-832 (Wis 1927).

Descriptors: *Wisconsin, *Navigation, *Ownership of beds, *Public rights, Legislation, Judicial decisions, Legal aspects, Navigable waters, Lake Michigan, Shores, Condemnation, Contracts, Lakes, Cities, Relative rights, Harbors, Land tenure, Mississippi River, Great Lakes, Land reclamation, Local governments, State governments, Public health.

Plaintiff city brought action to quiet title to certain submerged lands at the edge of Lake Michigan. Plaintiff claimed the land through a grant from the state legislature. Defendant state contended that the land had to be held in trust for the public and be utilized only in aid of navigation. Plaintiff had agreed to convey title to the land to a private corporation in exchange for a piece of property owned by said corporation which plaintiff considered vital to the successful construction of port facilities. After considerable deliveration, the court found that the granting of the land to the corporation and the subsequent construction of a pier thereon would not be a violation of the trust doctrine but rather a necessary step to be taken in the aid of navigation and commerce. The judgment of the lower court in favor of plaintiff was affirmed. (Price-Florida)
W71-02187

MELANDER V FREEBORN COUNTY (DAMAGES TO LAND AND CROPS AS A RESULT OF DAM CONSTRUCTION).
212 NW 590-591 (Minn 1927).

Descriptors: *Minnesota, *Lakes, *Dams, *Water levels, Navigable waters, Meanders, Judicial decisions, Legal aspects, Watersheds (Basins), Public rights, Flooding, Administration, Dam construction, Erosion, Crops, Obstruction to flow, Outlets, High water mark, Discharge (Water), Floodwater, Local governments.

Plaintiffs were riparian landowners upon a navigable lake. Their land was usually tillable, but portions of it was marshy and flooded when the level of the lake was high. Defendant county built a dam across the outlet of the lake to maintain the water at its 'usual' level. Plaintiffs brought an action for damages, claiming that the dam held the water higher than state law authorized. The trial court found that the dam was in no way an obstruction to flow and that plaintiffs' lands and crops were never flooded as a result of the dam construction. The height of the water was found to be controlled by the subcrests of the dam and not by that balance of the dam extending above the height of the subcrest. The Supreme Court of Minnesota affirmed the lower court's decision for defendant, finding that the dam held the water at a level no higher than that which nature had prior to the dam's construction. Defendant had complied substantially with state statutes in building the dam to maintain the water at its natural level. (Barnett-Florida)
W71-02188

THE COLOMBO (FEDERAL STATUTE PROHIBITING POLLUTION OF NEW YORK CITY HARBOR).
28 F2d 1004-1005 (SD NY 1928).

Descriptors: *New York, *Admiralty, *Water pollution, *Navigable waters, Legislation, Harbors, Ships, Oil, Oil wastes, Sludge, Judicial decisions, Legal aspects, Oily water, Adjudication procedure, Accidents, Federal government, United States, Water pollution control, Water pollution sources.

The United States brought libel action against a steamship for dumping oil into New York harbor in violation of a federal act prohibiting the discharge of injurious deposits into the harbor or adjacent waters. The court dismissed the action, holding that the statute must be strictly construed and cannot be said to be violated when a barge pumped valuable oil into the sea through a valve on the ship which unknowingly had been left open. (Duss-Florida)
W71-02189

MATTER OF FORD (COMPENSATION FOR DEPRESSED LAND VALUES WHERE REDUCED WATER SUPPLY UPSET RIVER'S ECOLOGY).
313 NYS2d 42-52 (App Div 1970).

Descriptors: *New York, *Eminent domain, *Water supply, *Compensation, Land tenure, Easements, Real property, Land appraisal, Land use, Right-of-way, Dams, Cities, Administrative agencies, Fishing, Swimming, Boating, Ecology, Balance of nature, Rivers, Judicial decisions, Legal aspects, Damages, Water resources, Water shortage, River flow.

The Board of Water Supply of the City of New York appealed from a decision affirming the report of commissioners of appraisal in eminent domain proceedings. Appellant had condemned water from a river to supply its inhabitants. The subsequent impairment of the river flow upset the ecology of the river, destroying its usefulness for swimming, boating and fishing. Accordingly, the market values of properties downstream from appellant's dam were depressed. In one instance respondent claimed indirect damage to a non-riparian tract, contending that it was the dominant tenement in an appurtenant right-of-way to the river. Determining that the right-of-way did not apply to that tract, the court disallowed compensation. The court also found that two other tracts for which respondent had claimed compensation were conveyed prior to appellant's condemnation and disallowed compensation for these tracts. The commissioners' orders were affirmed in part and reversed in part. (Hart-Florida)
W71-02190

THOMPSON V WATER RESOURCES COMM'N (JUDICIAL REVIEW OF DREDGING PERMIT).
267 A2d 434-438 (Conn 1970).

Descriptors: *Connecticut, *Dredging, *Landfills, *Permits, Administrative agencies, Administrative decisions, State governments, Decision making, Channels, Streams, Backfill, Land development, Marshes, Ecology, Balance of nature, Legislation, Legal aspects, Judicial decisions.

Plaintiff landowner brought action to repeal defendant commission's grant of a dredge permit to an adjoining landowner. The adjoining landowner wished to dredge and fill his riparian property in order to subdivide it for high-grade residences. He intended to use the dredged material to fill in an artificial channel and a concave area along his shore. He applied to defendant for a dredge permit as required by statute. The statute required defendant, in rendering the decision, to consider the area's ecology, the rights of other owners, and navigation. The permit was opposed by 60% of the neighboring landowners, who contended that the area's basic ecology would be upset by the dredging. Defendant conducted a public hearing and concluded that the proposed dredging would injure the ecology only slightly and that certain aspects of the ecology would be improved. Plaintiff contended that defendant's only legal decision was to deny the permit. The court found that defendant had properly examined all required considerations and that the evidence amply supported defendant's decision. The lower court's decision for defendant was affirmed. (Hart-Florida)
W71-02191

JACKVONY V POWEL (PUBLIC PASSAGE BETWEEN HIGH AND LOW WATER MARKS).
21 A2d 554-558 (RI 1941).

Descriptors: *Rhode Island, *Public rights, *Beaches, *Access routes, Boundaries (Property), Local governments, Administrative decisions, Community development, Judicial decisions, Land tenure, Legal aspects, Legislation, Proprietary power, Recreation, Relative rights, Riparian land, State governments, High water mark, Low water mark, Barriers.
Identifiers: *Constitutionality, Fences.

By special act the Rhode Island legislature clothed defendant City Commission of Newport with authority to take charge of and control the beachfront within the city limits, including the shores thereof between the high and low water marks. Pursuant to this act, the city proposed to fence in the beach within the city limits down to the low water mark. Plaintiff attorney general sued to enjoin such construction on the grounds that the special act was unconstitutional. The state constitution provided that the people would continue to enjoy all the rights and privileges of the shore. The court held that such rights and privileges included the right to public passage along the shore, subject, possibly, to reasonable regulation. The act was found to be unconstitutional in that the powers it vested in the commission were too broad and unrestricted to assure that public passage would not be materially impaired. (Clarke-Florida)
W71-02192

HOLYOKE WATER POWER CO V WHITING AND CO (UNAUTHORIZED USE OF WATER SUPPLY).

276 Mass 528, 177 NE 568-574 (1931).

Descriptors: *Massachusetts, *Water utilization, *Water contracts, *Water supply, Dams, Mill dams, Industrial plants, Canals, Water rates, Water rights, Relative rights, Artificial use, Grants, Industrial production, Dam design, Networks, Network design, Remedies, Adjudication procedure, Judicial decisions, Legal aspects, Contracts.

Plaintiff water power company sought to enjoin defendant from using water supplied by plaintiff in a manner different than the stated restrictions in certain grants of water rights from plaintiff to defendant. Plaintiff alleged that defendant used water on lands to which the supply was not appurtenant, used amounts of water in excess of the grants, was planning to use the supply for purposes prohibited in the grants and operated its water gates during hours not contemplated in the grants. Defendant argued that the alleged improper uses were not expressly prohibited by the grants. Ruling that grants such as those in question must be interpreted in light of all the normal material circumstances and not in light of the words alone, the Supreme Judicial Court of Massachusetts granted the injunction sought by plaintiff. The court stated that use of water for unauthorized purposes is a sufficient ground for equitable relief. (Barker-Florida)
W71-02193

BELKUS V CITY OF BROCKTON (LIABILITY FOR FLOOD DAMAGE FROM BLOCKED STREAM).
184 NE 812-15 (Mass 1933).

Descriptors: *Massachusetts, *Flood damage, *Drainage practices, *Remedies, Cities, Local governments, Legislation, Streams, Drainage, Drainage systems, Floods, Flooding, Damages, Water levels, Pipes, Obstruction to flow, Adjudication procedure, Judicial decisions, Legal aspects.

In an action to recover for flood damages, plaintiff contended that defendant city negligently operated its drainage system. After the city had improved a series of watercourses in order to facilitate better drainage, pipes were laid in streams where required. Plaintiff claimed that the water levels of such streams were raised and that resulting backwater flooded the basement of his building. Defendant claimed that it was acting pursuant to legislation, and any damages should be recoverable on the theory of a taking, not under tort action. Finding that the damages were caused by the negligence of defendant, the Supreme Judicial Court of Massachusetts ruled that tort was the proper action in such a case. The court further ruled that the measure of damages in a temporary nuisance was the combination of the amount spent by plaintiff to remedy the damage and the diminution of rental value while the injury continued. (Barker-Florida)
W71-02194

CAPE ROMAIN LAND AND IMPROVEMENT CO V GEORGIA-CAROLINA CANNING CO (OWNERSHIP OF LAND BETWEEN HIGH AND LOW WATER MARKS).
146 SE 434-440 (SC 1928).

Descriptors: *South Carolina, *Ownership of beds, *Low water mark, *High water mark, Legal aspects, Judicial decisions, Remedies, Damages, Tidal waters, Tides, Navigable waters, Bays, Navigable rivers, Boundaries (Property), Coastal marshes, Wetlands, Public rights, State governments, Tides, Prescriptive rights.

Plaintiff land company sought to restrain defendant oyster companies from trespassing on lands plaintiff claimed to own and also sought damages for prior trespasses. Defendants, who had leased the lands from the state, contended that the lands were between the high and low water marks of navigable waters and thus were owned by the state in trust for the people. The Supreme Court of South Carolina affirmed a lower court's decision for defendants. The court stated that title to land on tidal waters runs to the high water mark, the limit of the flux of

the usual tide, unless otherwise shown. The court held that plaintiff failed to produce sufficient evidence to show either a grant or adverse possession to the low water mark. The fact that plaintiff's deed specified marshland was insufficient since marshland can be dry in some seasons. A dissenting opinion noted that of 34,290 acres of marshland plaintiff's predecessors purchased from the state, only 6.2 acres were above the high water mark. Thus, although the deeds did not specify that title was to extend to the low water mark, that construction would be more reasonable. (Morris-Florida)
W71-02195

LANGERIN V FLETCHER (INTERPRETATION OF 'BANK' AS PROPERTY BOUNDARY).
273 Mass 543, 174 NE 194-196 (1931).

Descriptors: *Massachusetts, *Boundaries (Property), *Banks, *Ravines, Legal aspects, Judicial decisions, Remedies, Ownership of beds, Watercourses (Legal), Streams, Channels, Streambeds, Riparian land, Boundary disputes, Adjudication procedure.

Petitioner sought to register title to a ravine through which a small brook formerly flowed. Petitioner previously had owned land on both sides of the brook, but later granted title to land on the south side to the predecessors in title of respondent. The deed to such land specified the grant was 'to the southerly bank of a brook.' Respondents contended this meant to the actual high water mark of the water, but petitioners claimed it meant only to the top of a high bank at the edge of the ravine. The Supreme Judicial Court of Massachusetts affirmed a lower court opinion that the deed was abmiguous, and thus evidence was properly admitted which showed that petitioner intended to grant only to the edge of the top of the ravine. Where a word in a deed is ambiguous, the meaning must be obtained from the instrument as a whole and the surrounding circumstances. A grant of land bounded by a bank of a stream generally excludes the bed if such bank has any width apart from the bed. (Morris-Florida)

WHITE V KNICKERBOCKER ICE CO (OWNERSHIP OF BEDS AS AFFECTED BY PROPERTY DESCRIPTION).
254 NY 152, 172 NE 452-455 (1930).

Descriptors: *New York, *Easements, *Boundaries (Property), *Ownership of beds, Banks, Legal aspects, Judicial decisions, Remedies, Lakes, Riparian land, Riparian waters, Riparian rights, Beds under water, Navigable waters, High water mark, Watercourses (Legal), Access routes.

Plaintiff sought to establish an easement over defendant ice company's land to have access to a certain lake. The respective titles of each party's property came from a common grantor. Plaintiff claimed that the grantor had reserved title to the lakebed when he transferred title to the strip of land along the lake which defendant owned. Plaintiff claimed such a reservation would naturally have established an easement for access to the lakebed. Defendant conceded an easement would have been established by reserving title to the lakebed but asserted the deed language 'to the lake' and 'along the side' of the lake carried title to the center of the lake. The Court of Appeals of New York, in reversing a lower court decision for plaintiff, held that where a description in a conveyance of riparian land is so framed as to 'touch' the water, rather than run the boundary on dry land, there is a presumption that it carries title to the center of the body of water. The court found that the word 'side' as used in the deed from the common grantor to defendant's predecessor 'touched' the water and thus did not reserve title to the lakebed to the grantor. (Morris-Florida)

TILLSON V CRANE BROOK CO (LIABILITY FOR THE NEGLIGENT LOWERING OF WATER LEVELS).
269 Mass 493, 169 NE 512-513 (1930).

Descriptors: *Massachusetts, *Great ponds, *Withdrawal, *Water levels, Diversion, Damages, Pumping, Relative rights, Competing uses, Judicial decisions, Legal aspects, Dams, Flumes, Low water mark, Bogs, Cranberries, Permits, Canals, Bench marks, Administration, Water level fluctuations.

Plaintiff brought an action to recover damages for the willful or negligent lowering of a great pond which allegedly prevented him from pumping sufficient water therefrom to overflow his cranberry bogs. Plaintiff alleged that defendant removed the flashboards from its flume for the purpose of lowering the water in the pond below the established low water mark. The Supreme Judicial Court of Massachusetts affirmed the lower court's holding for defendant, finding that there was insufficient evidence to warrant a finding for plaintiff that the lowering of the water level in the pond was a result of defendant's negligence. (Barnett-Florida)
W71-02198

YASKILL V THIBAULT (LIABILITY OF LOWER RIPARIAN OWNER FOR BLOCKING STREAM).
273 Mass 266, 173 NE 504-505 (1930).

Descriptors: *Massachusetts, *Natural flow doctrine, *Obstruction to flow, *Watercourses (Legal), Flood damage, Riparian land, Banks, Riparian rights, Waste water disposal, Water pollution, Cesspools, Natural streams, Ponds, Surface waters, Walls, Dams, Diversion dams, Water control, Legal aspects, Judicial decisions, Remedies.

Plaintiff riparian owners sought an injunction against defendant lower riparian owner to require removal of an obstruction which caused water to flood plaintiff's lands. Defendant constructed a cement wall on his land, causing water to back up which ordinarily had flowed away naturally. Defendant contended the water was not a natural stream because there was an area between a pond and a river in which the water spread over level land before returning to a defined bed. Defendant also sought to defend on the basis that plaintiffs had polluted the water by allowing cesspools to drain into it. The Supreme Judicial Court of Massachusetts upheld the lower court's finding that the course was well-defined enough to make it a natural stream. The court also rejected the pollution defenses, stating that such pollution was an independent wrongful act not related to the wrong and injury suffered by plaintiffs. (Morris-Florida)

PUBLIC UTILITIES COMM'N V EAST PROVIDENCE WATER CO (RIGHT OF WATER COMPANY TO RAISE RATES).
136 A 447-455 (RI 1927).

Descriptors: *Rhode Island, *Public Utilities, *Water rates, *Water rights, Administrative agencies, Water supply, Water utilization, Domestic water, Industrial water, Water users, Public rights, Judicial decisions, Legal aspects, Cities, Legislation, Municipal water.

The Rhode Island Public Utilities Commission instituted an investigation into the reasonableness of proposed increased rates filed by a water company and subsequently approved them. The town and fire district affected by the rate increase appealed this approval to the Rhode Island supreme court, and the court reversed. Among the important factors in the court's reversal was evidence that the water company had divested itself of a pond and the water rights in the pond, and also had allowed two companies to pump water from the pond without payment of compensation. The court stated that, when the pond and water rights were acquired by the water company as a public utility, they became devoted to public use. The company could not divest itself of ownership unless such action was clearly in good faith and the property was not necessary for public use. The water company had argued that those taking water without compensation had a right because they were located on the shores of the bond. However, the court rejected this contention. The water rights were exclusively in the owner of the pond. (Duss-Florida)

A METHODOLOGY FOR FLOOD PLAIN DEVELOPMENT AND MANAGEMENT.
TRW Systems Group, Redondo Beach, Calif.

Available from NTIS as AD-704 716, $3.00 in paper copy, $0.95 in microfiche. Army Engineer Institute for Water Resources, IWR Report 69-3, December 1969. 185 p. Contract DACW31-68-C-0042.
Identifiers: *Urban planning, Floods, *Floods, Control, Protection, Industries, Hazards, Roads, Dams, Construction, Arizona, Nevada, Reno (Nevada), Tuscon (Arizona), *Flood plains, *Flood plain management.

A methodology is presented by which the consequences (mainly economic in nature) of choosing various flood plain management alternatives may be evaluated so as to achieve a stated set of objectives. The methodology is commonly known as a trade-off analysis. It is illustrated by two case studies, one for the Reno, Nevada area, and the other in the Tuscon, Arizona area.

PRINCIPLES AND PROCEDURES IN FLOOD PLAIN MANAGEMENT,
Tennessee Valley Authority, Knoxville.
James E. Goddard, and John W. Weathers.
In: Proceedings, American Society of Civil Engineers, Journal of the Hydraulic Division, Vol 95 No HY4, p 1321-1326, July 1969.

Descriptors: *Flood plains, *Methodology, *Management, *Planning, *Flood control, Coordination, Water resources, Watershed management, Cities.
Identifiers: *Flood plain management, Metropolitan areas, Implementation.

Comprehensive flood plain management is defined as the planning and action to determine, implement, and revise, as needed, plans, for the wise and best use of flood plains and their water resources for the welfare of our nation. The necessity and purpose of changing from the traditional approach is briefly stated. Principles of wise management are presented for communities, cites, metropolitan areas, small watersheds, and large watersheds. Procedures for planning and implementation for the various types of areas ore outlined and examples cited. Flood plain regulations and their role is reviewed. The critical role of close coordination of effort by local, states, and Federal interests is stressed. (Davis-Chicago)

AMORTIZATION OF NONCONFORMING USES IN FLOOD PLAINS,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
William R. Walker.
Journal of the Urban Planning and Development Division, Proceeding of the American Society of Civil Engineers, Vol 96, UP1, p 1-16, March 1970. 10 ref.

Descriptors: *Amortization, *Flood damage, *Flood plains, *Legal aspects, *Flood plain zoning, *Non-structural alternatives, Planning, City planning, Flood zoning.
Identifiers: *Flood plain management, *Flood damage reduction.

The majority of courts appears to sustain zoning ordinances with amortization provisions for eliminating nonconforming uses if the amortization periods is reasonable and the detriment to the individual is small in relation to the benefits to the public. Condemnation, abandonment, prohibiting or limiting extensions and repairs, and amortization are four methods used to eliminate nonconforming uses. Amortization is presented as the best method of removing nonconformities in the flood plain for purposes of reducing flood damages. Some of the prevalent theories of the court and a brief review of the most cited cases are presented to bring about a better understanding of zoning with an amortization plan. (Davis-Chicago)

6G. Ecologic Impact of Water Development

CONCEPTS AND UTILITIES OF ECOLOGIC MODEL,
Water Resources Engineers, Inc., Walnut Creek, Calif.
Carl W. Chen.
In: Proceedings, American Society of Civil Engineers, Journal of the Sanitary Engineering Division, Vol 96, No SA5, p 1085-1097, October 1970. 7 fig, 3 tab, 19 ref.

Descriptors: *Ecology, *Ecosystems, *Model studies, *Mathematical models, Eutrophication.
Identifiers: *Ecologic model, Acquatic ecosystem.

Basic components of an aquatic ecosystem are modified continuously by such ecologic processes as photosynthesis, respiration, zooplankton grazing, fish predation, nutrient recycling, sedimentation and various transport phenomena. A set of differential equations describing these processes can be assembled and operated simultaneously to model physical, chemical and biological behavior of such ecosystem. Preliminary experiments with an ecologic model of this type indicate the reasonableness of the technique. It is concluded that model development and application will greatly aid a more fundamental understanding of eutrophication processes and their control. (Davis-Chicago)

07. RESOURCES DATA

7A. Network Design

SATELLITE (ERTS-A) NETWORK OF GROUND DATA SENSORS: A USER-ORIENTED EXPERIMENT,
Geological Survey, St. Louis, Mo. EROS Program.
Jaems F. Daniel.
Preprint No. 29, Paper presented at National Symposium on Data and Instrumentation for Water Quality Management, Madison, Wisconsin Univ, July 1970. 13 p, 1 fig, 3 tab, 6 ref.

Descriptors: *Satellities (Artificial), *Networks, *Data collections, *Remote sensing, Geology, Hydrology, Water resources, Meteorological data, Meteorology, Hydrologic data.
Identifiers: ERTS.

The intent of providing ground sensor data concurrently with and in the interim of successive image sets from the ERTS-A satellite is to improve the qualitative, semi-quantitative and quantitative interpretations of that imagery. A network of a relatively small number of stations with maximum areal application to provide that data has been designed and sites have been selected. Important to that network are hydrologic sensors as they relate to visual interpretation of imagery and management of water resources. A localized network of sensors to test real-time applications of satellite relayed data will have water quality sensors as a basic ingredient. (Knapp-USGS)

THE SIMULATION OF THE MOVEMENT OF AN INTERFACE BETWEEM SALT AND FRESH WATERS IN A COASTAL AQUIFER BY THE AID OF AN RC ANALOG,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
G. Dagan.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 111-119, 1969. 9 p, 9 fig, 3 ref.

Descriptors: *Analog models, *Resistance networks, *Saline water-freshwater interfaces, Model studies, Groundwater movement, Simulation analysis, Flow, Porous media.
Identifiers: *Coastal aquifers.

Resistance-capacitance (RC) networks are usually used to simulate the linearized equations of groundwater flow in unconfined aquifers. A similar linerization gives a system of two equations for the flow of fresh and salt waters, separated by an interface, in coastal aquifers. A double resistance network connected by capacitors is proposed to model this system. The voltage difference between the two subnetworks is proportional to the interface elevation. Other different types of analog networks are reviewed. (Knapp-USGS)

A CONDUCTIVITY BRIDGE FOR THE MEASUREMENT OF SALINITY OF SEA WATER,
Woods Hole Oceanographic Institution, Mass.
Alvin L. Bradshaw, and Karl E. Schleicher.
Available from NTIS as AD-699 901, $3.00 in paper copy, $0.95 microfiche. Technical report, No. WHOI-REF-56-20, Mar 1956. 66 p, 17 fig, 14 ref. Bu Ships Contract NObsr-43270.
Identifiers: *Salinometers, Design, Operation, Electrical conductance, Fixed resistors, Capacitors, Wiring diagrams, Impedance bridges, Salinity, Measurement, Sea water.

A sea-going conductivity bridge (Salinometer) for measuring the salinity of sea water is described in considerable detail. In principle, the salinity of an unknown sample is determined by comparing its conductivity with that of a sample of known salinity at the same temperature. The calibration of the bridge is found empirically. The instrument consists of a constant temperature bath, a 1000 cycle impedance bridge using glass conductivity cells in two of its arms, a phase detector to convert the 1000 cycles output of the bridge to DC and a balancing mechanism to complete automatically the fine adjustment in bridge balance. It operates from a a 110 v60 cycle power source.

Identifiers: *Water resources research, Stanford Watershed Model.

Simulation models of river basin hydrology are briefly reviewed. Simulation models employ functions which are chosen with a view to describing the hydrologic process with reasonable accuracy and yet are susceptible to rapid solution on the digital computer. Development of the Stanford Watershed Model has had a significant impact on hydrologic education at Stanford. The contributions of SWM to hydrologic education at Stanford have occurred in a number of ways. Basically these may be grouped under three headings: organizing instruction around the flow diagram of the Stanford Watershed Model as a basic functional description of the hydrologic cycle; providing greater opportunity for students to explore hydrologic processes via digital simulation; and providing a base for a variety of research projects in hydrology. In addition to its use as a basis of discussion, the SWM permits rapid determination of the effects of various factors on the hydrologic process. Starting from some reference conditions one may investigate the effect of altering rainfall amount or intensity, antecedent soil moisture, potential evaporation, number of precipitation stations, changes in land use, changes in channel conditions and many other factors. The consequences of such changes on the streamflow hydrograph, soil moisture, actual evapotranspiration or suspended sediment outflow may be determined for a single storm or during a month or year. If snow is involved, the effect of altering wind, dewpoint, insolation or initial snowpack on patterns of snowmelt or streamflow may be evaluated. (Knapp-USGS)

Identifiers: Computer graphics.

Computing time-dependent power spectra is an important method for studying non-stationarities in signals. An efficient procedure for computing such spectra and displaying them immediately is requisite for effective application. The method presented is based on a data window which moves along the signal in unit increments. The spectrum is updated for each new sample. All spectra are displayed on a computer graphic terminal and the algorithm was deliberately constructed to make computer graphic display efficient. (Woodard-USGS)

Descriptors: *Sedimentation, *Erosion, *Channel erosion, *Turbidity currents, *Ocean currents, Channel flow, Ocean circulation, Turbidity, Sediments, Channel morphology, Graduation, Profiles, Contiental slope, Marine geology, Littoral drift, Sediment transport, Alaska, Pacific Ocean.
Identifiers: Abyss, Aleutian trench, Axial profile, Graphs, Tectonic activity (Aleutians).

The SEAMAP deep-sea channel is a relic feature on the Aleutian abyssal plain south of the Aleutian trench. Along most of its 370-km length it has well-developed levees that are generally asymmetrical and differ in height. Typically the channel is about 50 m in depth and/6km in width. From its northern end on the south wall of the Aleutian trench the channel floor rises towards the southwest from a depth of 4800 m to a minimum depth of 4590 m near its midpoint. Continuing in the same direction it deepens again to 4750 m. This gradient reversal precludes turbidity currents from flowing through the channel and supports the thesis that the Aleutian abyssal plain is a relic feature that has been cut off from its supply of turbidite material by the downbowing of the Aleutian trench. The channel apparently has been destroyed by slumping on the south wall of the trench north of the 4800-m countour. For much of its length, it is subparallel to the trench and from a topographic standpoint occupies the crest of the outer ridge south of the trench. (Woodard-USGS)

SOME RULES USED FOR THE OBSERVATION OF CONCRETE DAMS,
Consulpresa S. A., Madrid (Spain).
J. L. Serafim, and M. Guerreiro.
Water Power, Vol 22, No 5/6, p 181-189, May-June, 1970. 9 p, 7 fig, 1 tab, 11 ref.

Descriptors: Dams, *Concrete dams, *Performance, Instrumentation, Data collections, Structural behavior, Safety, Inspection, Foreign countries, Operation and maintenance, Control systems, Displacements, Deformation, Seepage, Settlement (Structural), Measuring instruments, Measurement, Behavior, Uplift pressure.
Identifiers: Procedures, Reports, Spain.

Experience gained in observing the performance of concrete dams in Spain over a 5-yr period is described. Typical cases presented are: (1) existing dams with and without observation systems; (2) control of the behavior of dams from the first total loading; and (3) observations of dams instrumented by a department organized for such work. Procedures followed in each case are indicated, special attention being given to the organization of the observation work, inspection of the dam, and study of special problems and their consequences at the time of first loading. Observation methods and a procedure to simplify and reduce the work of calculations and diagrams are indicated. Present observation techniques make possible the behavior control of any dam not having an observation system, regardless of age or type. Recommended procedure for establishing the observation of a dam is: (1) assemble relevant design and construction documents; (2) inspect the dam; (3) report on the

type of observation system to be installed; (4) elaborate the observation plan; and (5) install the apparatus and fulfill the program of readings and measurements. (USBR)

Identifiers: Manapouri Project, New Zealand, Blasting, Construction methods, Tunnel supports.

The Manapouri turbines discharge to the sea through a 6-1/4-mi-long tailrace tunnel that is a concrete-lined, 30-ft-dia horseshoe section with a flat invert. A surge chamber and shaft accommodate any surge action. Tunnel design, preliminary construction work, excavation methods, drainage and pumping problems, blasting and mucking procedures, and tunnel lining operations are described. Preliminary on-shore work started at Deep Cove, New Zealand, in Sept 1963, with the first shot being fired in Feb 1964, and the tunnel ready for service at the end of Aug 1969. Seven major fault zones were encountered in the tunnels length. (USBR)

Descriptors: Dams, Contrete dams, *Buttress dams, Dam foundations, *Dam construction, Preliminary investigations, *Dam design, Concrete placing, Design criteria, River basin development, Water resources development, Foreign construction, Project planning, Construction, Concrete control, Scheduling, Planning, Design flood.
Identifiers: Great Britain, *Clywedog Dam, Great Britain, Construction control, Construction methods.

Clywedog Dam is a 220-ft-high, 730-ft-long concrete buttress dam located on the Clywedog River in Great Britain. The history and description of the project from initial planning to the first filling of the reservoir are presented. The basic aims of the structural design of the dam were: (1) the effective slenderness ratio of buttresses should not exceed about 10; (2) based on conventional linear analysis, maximum principal compressive stress should not exceed 490 lb/sq in. and there should be no tension; (3) the ratio of horizontal thrust from the water to the weight of a buttress should not exceed 0.85 at the foundation; and (4) loads on the foundation should not exceed 18 tons/sq ft. Linear analysis was checked by a more eleborate finite element analysis which was shown to be advisable by readings of stress and strain gages installed during construction. Construction planning, procedures, and control are described. The bulk of concrete in the dam was placed by a 10-ton cableway equipped with a fixed-head mast and a tail carriage that traveled along a track long enough for the burden rope to cover the entire dam area. Concrete was specified by strength, and few problems were encountered with temperature control using ordinary portland cement. (USBR)

RUMANIAN IRRIGATION.

Engineering News Record, Vol 185, No 23, p 13, December 3, 1970. 1 p.

Descriptors: *Irrigation systems, *Irrigation engineering, *Hydraulic design, Economics, Operation and maintenance, Canals, Pipes, Automatic control, Penstocks.
Identifiers: Rumania, Danube Plain.

A $52 million irrigation system under construction in Rumania's Danube Plain, southwest of Bucharest, will ultimately provide water to 200,000 acres. Crop output could be more than doubled by the system. London-based consultants say water will be pumped from the Danube River into an unlined canal that crosses the floodplain. An automatic main pumping station with 8 pumps will force water at 1,530 cfs up a 3-mile long steel penstock with a static lift of 232 ft. The water will flow in lined gravity canals 5 miles to a second pumping station where 5 pumps will lift the water 85 ft through a 2-mile long penstock into the final distribution level. The system will be automated for maintaining constant volume, and 156 secondary pumping stations located throughout the system will help monitor the flow of water. In the event of power failure or too much water in any part of the works, wiers will close automatically to reduce or stop the flow. (Lang-USGS)

RELATIVE EFFECT OF WAVES GENERATED BY LARGE SHIPS AND SMALL BOATS IN RESTRICTED WATERWAYS,
California Univ., Berkeley, Hydraulic Engineering Lab.
M. M. Das.
Available from NTIS as AD-704 298, $3.00 in paper copy, $0.95 in microfiche. Report No. HEL-12-9, November 1969. 41 p, 6 tab, 64 fig, 64 ref. Army DACW72-68-C-0034.
Identifiers: *Ships, *Water waves, *Boats, Water waves, Hydrodynamics, Insland waterways, Harbors, Erosion, Piers, Floating docks, Cargo ships, Energy, Velocity.

The peak wave energy in a system of waves resulting from the passage of a ship is important in engineering problems such as bank erosion, the motion of moored vessels, and forces on fixed and floating docks. With respect to bank erosion, the question often asked is whether the single passage of a large ship is more damaging than numerous passages of small pleasure craft. The study was conducted to determine the relative importance of the peak energy resulting from the passage of a cargo ship and a pleasure cruiser. The characteristics of the waves generated by these vessels moving at various speeds in deep and shallow water were determined from model studies. A numerical example is given in which prototype values of peak wave energy were predicted from the model data, and then ratios of the peak energies computed. The importance of ship speed is evident in these comparisons.

DETRIMENTAL EFFECTS OF NATURAL SOIL AND WATER ELEMENTS ON DRAINAGE PIPE STRUCTURES IN ALABAMA,
Geological Survey, Tuscaloosa, Ala. Water Resources Div.
Luther W. Hyde, Victor M. Shamburger, Jesse S. Ellard, and Rubin E. Pate.
Available from NTIS as PB-189 373, $3.00 in paper copy, $0.95 in microfiche. Alabama Highway Research Report No. HPR-40, 1969. 152 p, 7 tab, 80 ref, 35 fig.
Identifiers: *Roads, Surface properties, *Skidding, Test equipment, *Trailers, Design, Friction, Towing vehicles. Water, Vibration, Velocity, Recording

systems, Control panels, Power, Calibration, Bituminous coatings, Asphalt, Concrete, Louisiana, Evaluation Skid numbers, *Skid resistance.

Field studies were conducted in Alabama on soil and water parameters to determine their relationship to culvert pipe corrosion. The types of culvert materials, investigated included concrete, galvanized steel, bituminous-coated galvanized steel, aluminum, bituminous-coated aluminum, pitch-impregnated fiber, cast iron, and vitrified clay. Water parameters measured included pH, oxidation-reduction potential, dissolved oxygen, resistivity, etc. Soil parameters determined were pH, oxidation-reduction potential, resistivity, and geologic conditions. Soil parameters generally were less significant than water parameters in the corrosion of culverts. A graphical method based on pH, resistivity, and dissolved oxygen content of water was devised for estimating life expectancy of steel pipe. Galvanized pipe is not recommended for use in run-off water of low resistivity, low pH or high dissolved oxygen content unless effectively coated with bituminous material. Aluminum pipe was found to be less affected by acidic waters than galvanized steel but less resistant to abrasion effects. With the exception of areas affected by acid mine drainage, concrete pipe was highly resistant to corrosion. Pitch-fiber pipe as well as corrugated cast iron and vitrified clay performed exceptionally well.

HYDRAULIC MODEL STUDIES OF SILVER JACK DAM SPILLWAY STILLING BASIN, BOSTWICK PARK PROJECT, COLORADO,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
T. J. Rhone.
Available from NTIS as PB-190 279, $3.00 in paper copy, $0.95 in microfiche. REC-OCE-70-3, January 1970. 22 p, 11 fig, 2 ref.
Identifiers: Silver Jack Dam, Bostwick Park (Colorado), *Stilling basins, *Spillways, *Dams, Hydraulic models, Colorado, Design, Model tests, Pipes, Baffles.

A massive landslide destroyed the nearly completed spillway stilling basin at Silver Jack Dam in Colorado. A circular curve in an inclined plane was used to connect the undamaged approach conduit and the relocated stilling basin. Hydraulic model studies were performed to assure satisfactory flow conditions in the conduit and stilling basin under limited tailwater conditions and with unsymetrical approach flow resulting from a circular curve in the upstream conduit. A deflector vane was installed in the crown of the tunnel downstream from the curve to prevent the flow from crossing over the top and sealing the portal. Vanes were developed for the stilling basin approach chute to improve flow distribution in the basin. Unique daffle blocks were developed to provide good energy distribution in a basin that had insufficient tailwater depth to form a conventional hydraulic jump. Pressure measurements were made on the conduit bend, conduit vane, chute vanes, and baffle blocks.

OPEN CHANNEL EXPANSIONS FITTED WITH LOCAL HUMP,
Sir George Williams Univ., Montreal (Quebec); And Indian Inst. of Science, Bangalore.
A. S. Ramamurthy, S. Basak, and P. R. Rao.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 96, No HY5, p 1105-1113, May 1970. 9 p, 6 fig, 1 tab, 7 ref, 2 append.

Descriptors: Channels, Channel erosion, Channel flow, Reynolds number, *Flow separation, *Expansion, Open channel flow, Hydraulics, Subcritical flow, Fluid mechanics, Transition flow, *Transitions (Structures), *Open channels, Deceleration, Velocity distribution, Laboratory tests, Erosion control, Flow control, Eddies, Roughness (Hydraulic).
Identifiers: Eddy currents.

Flow in channel expansions tends to separate while subjected to the adverse pressure gradient associated with flow deceleration. Flow separation causes eddying and erosive attack on the downstream channel. Tests show that a local hump set in the bottom profile of an expansion decreases the incidence of flow separation and diminishes erosive action. The specific energy diagram is used to describe the action of the hump. Sectional views of normalized velocity contours for a test flume with and without humps at several values of Reynolds number are presented. Plan views of normalized velocity distribution curves for the test flume with and without humps are presented for large Reynolds numbers. (USBR)

PRESSURE SURGE ATTENUATION UTILIZING AN AIR CHAMBER,
Kentucky Univ., Lexington.
D. J. Wood.
Proc Amer Soc Civ Eng, J Hydraul Div, Vol 96, No HY5, p 1143-1156, May 1970. 14 p, 10 fig, 10 ref, 2 append.

Descriptors: Water hammer, Hydraulics, *Surges, *Unsteady flow, Fluid mechanics, Oscillation, Pulsating flow, *Air chambers, *Attenuation, Analysis, Performance tests, Pipelines, Pipe flow, Closed conduit flow, Analytical techniques.
Identifiers: Wave propagation, Transient flow, Pressure waves, Surge waves, Pipeline surges.

The effect of a single air chamber on the propagation of a pressure surge in a line is investigated. The pressure surge is generated by rapid closure of a downstream value. A distributed parameter wave analysis and a lumped parameter slug flow analysis are formulated to describe the transient flow situation. Short-term effects are not predicted by a lumped parameter analysis, but are important; the magnitude of the short-term surge may be many times greater than that predicted by a lumped parameter analysis. The optimum design of an air chamber is possible, and is dependent on short-term effects. Experimental results were in close agreement with those predicted. The performance of an air chamber must be evaluated relative to a specific application; an accurate transient analysis is necessary and can be accomplished using the approach described. (USBR)

SURGE AND AIR ENTRAINMENT IN PIPELINES,
Bureau of Reclamation, Denver, Colo.
L. H. Burton, and D. F. Nelson.
Pap, Inst Contr Flow Closed Conduits, Colo State Univ, Aug 1970. 40 p, 25 fig, 9 ref.

Descriptors: *Air entrainment, *Surges, *Pipelines, Closed conduits, Closed conduit flow, Distribution systems, Fluid flow, Control, Vents, Upstream, Check structures, Oscillation, Air traps, Analysis, Control systems, Water conveyance.
Identifiers: *Coachella Distribution System, Calif, *Canadian River Project, Tex, Pipestands.

The Bureau of Reclamation has constructed 2 closed conduit water conveyance systems using upstream control. They are the Coachella Valley Distribution System in southern California and the Canadian River Project in northwestern Texas. Operational problems in the 2 systems, laboratory and field tests conducted before and after construction, and solutions adopted for surge and air entrainment problems during design and construction are reviewed. Problems in upstream control systems have been more severe than in downstream control systems. An upstream control system is feasible for economical reasons where the topography lends itself to such a system. Past experience and better tools for analysis will reduce the magnitude of future problems in upstream control systems. Future systems are discussed, including methods of analysis for surging and air entrainment, and types of strucutres that may be used. (USBR)

PREDICTION OF ORIFICE DISCHARGE AND HEAD LOSS ALONG A SMALL DIAMETER TERMINAL PERFORATED PIPE,
New Mexico State Univ., University Park. Dept. of Civil Engineering.
Frank H. Jones.
M. S. Thesis, New Mexico State University, March 1969. 45 p, 10 fig, 7 tab, 21 ref, 1 append. OWRR Project A-006-NMEX (2).

Descriptors: *Head loss, *Subsurface irrigations, *Plastic pipes, *Orifices, Irrigation water, Pipes, Orifice flow, Pipe flow, Darcy-Weisbach equation, Equations, Discharge coefficients.
Identifiers: Perforated pipes, Head loss prediction.

A prediction equation was developed to be used to predict the head loss occurring along a one-half inch perforated polyethelene plastic pipe, the leading type used in subsurface irrigation systems. An equation which was developed experimentally shows the head loss to be approximately 70% of that predicted by a measured value of the Darcy-Weisbach friction factor on a similar unperforated pipe. A prediction equation was also developed for orifice flow through the pipe perforations. Orifices were drilled with a thirty-thousandths of an inch diameter bit and the coefficient of discharge was found to be 0.612. It was found that with careful preparation, the Christiansen uniformity coefficient of ninety to ninety-five percent could be obtained for orifices under the same head. (Knapp-USGS)

SOME MORPHOMETRICAL RELATIONSHIPS IN THE MIDDLE AND LOWER REACHES OF THE AMU DARYA,
Sredneazuatsjuu Bauchno-Issledovatelskii Institut Irrigatsii, Tashkent (USSR).
A. M. Mukhamedov, and H. A. Ismaghilov.
In: Proceedings 13 th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 5-1 (Seminars), Science Council of Japan, Kyoto, p 191-194, 1969. 4 p, 1 fig, 2 tab, 7 ref.

Descriptors: *Channel morphology, *Alluvial channels, Rivers, Sediment transport, Bed load, Sediment load, Suspended load, Scour, Erosion, Discharge (Water), Sediment discharge.
Identifiers: Amu Darya River (USSR).

The Amu Darya is the largest river of Central Asia. Flood discharges of the Amu Darya River vary from 5,000 to 10,000 cu m/sec. Low water discharges vary from 200 to 300 cu m/sec. The difference between the flood level and the low water level amounts to 2.5 to 3 m. The river carries a very large amount of suspended sediments and bedload. Long-term mean density of suspended sediment in the lower reaches is 2.56 kg/cu m, while the highest density of suspended sediment is as high as 13 kg/cu m. The channel is in a state of continuous change due to a steep slope (0.00015-0.00035), high velocities of the flow (up to 2.5 to 3.5 m/sec.), instability of the hydrograph throughout the year, and especially during the high water period, and an extreme instability of the channel, which is formed of erodible fine sands of 0.10 to 0.0 mm diameter. (Knapp-USGS)

Science Council of Japan, Kyoto, p 195-200, 1969. 6 p, 2 fig, 3 ref.

Descriptors: *Hydraulic models, *Hydraulic similitude, *Sediment transport, Alluvial channels, Model studies, Sands, Density, Discharge (Water), Sediment discharge, Sedimentary structures.
Identifiers: Movable-bed models.

To study problems of river bed deformation on rivers with structures of economic importance, it is often necessary to use movable-bed models. Techniques developed for the study of stream hydraulics on rigid models cannot be applied easily to movable-bed models. For good scaling, sand must be replaced by lighter material or water discharge must be increased relative to that estimated by F number, which depends to some degree on intuition. The type of substitute affects the shape of dunes and the rate of sediment transport; therefore it is not easy to choose what substitute to use. Methods of calculating sediment density and water discharge relationships for the best scale factors are briefly discussed. (Knapp-USGS)

Descriptors: *Sand waves, *Meanders, *Sediment transport, *Bed load, *Uniform flow, Sands, Turbulent flow, Regime, Hydraulic models, Alluvial channels, Open channel flow, Channel morphology.
Identifiers: Japan, Transverse water-surface oscillations.

A mathematical analysis was made of the length and height of sand waves formed on a movable bed in open channels under the condition of uniform flow. The mean length of alternating bars in straight channels and the meander length of meandering streams are related to the flow parameters using the oncept of transverse oscillations of the water surface. The height of sand waves in the equilibrium state for the low flow regime is determined by the flow parameters using the shallow-water approximation for the fluid and the continuity equation for sediment transport. The theory seems to give a reasonable explanation of the variation of the height of sand waves with the flow conditions. These analytical results are compared with experimental data obtained from measurements in experimental flumes and in rivers, with generally good agreement. (Knapp-USGS)

French resume included. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 5-1 (Seminars), Science Council of Japan, Kyoto, p 277-280, 1969. 4 p, 1 fig, 2 ref. NSF Research Grant GK-0549.

Descriptors: *Roughness (Hydraulic), *Variability, *Stream erosion, *Degradation (Stream), Sediment transport, Model studies, Flumes, Sediments, Particle size, Particle shape, Equations.

The variation of roughness during a degradation study in a laboratory flume was found to be the same as that of the equilibrium flow. During degradation, the form resistance increased for sand finer than 0.6 mm and decreased for sand coarser than 0.6 mm. At the end of degradation, Shield's criterion for incipient motion was valid for sand coarser than 0.6 mm when the bed was plane and it was not valid for sand finer than 0.6 mm when the bed was rippled. Oleg F. Vasiliev.
In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 5-3 (General Lectures, Records of Congress, Social Events and Study Tours), Science Council of Japan, Kyoto, p 39-84, 1969. 46 p, 94 ref.

Descriptors: *Sediment transport, *Open channel flow, *Rheology, *Hydrodynamics, *Theoretical analysis, Reviews, Mathematical studies, Equations, Erosion, Runoff, Streamflow, Turbulent flow, Flow rates, Sediment load, Suspended load, Sediment distribution, Settling velocity, Gravity, Sedimentation, Particle size, Diffusion, Fluid mechanics, Viscosity, Foreign projects.
Identifiers: *USSR, *International Association for Hydraulic Research.

A review of hydrodynamic theories of sediment transport in open-channel flow is presented from material developed primarily from research that has been done in the Soviet Union. Methods of deriving equations related to two-phase flow are described. In the thirties the turbulent diffusion theory was developed in application to the movement of suspended load in open channels, first by V.M. Makkaveyev (1931) and M.P. O'Brien (USA,1933), and later was published on by others. The chief shortcoming of the theory is that it considers suspended particles as a passive substance which, is carried by, but exerts no dynamic response on the flow of the transporting fluid. Significant progress in establishment of a theory of turbulent multicomponent flows came about in the fifties with publication by F. I. Frankle's theory and work by others. (Woodard-USGS)

French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 3 (Subject C), Science Council of Japan, Kyoto, p 233-240 1969. 8 p, 3 fig.

Descriptors: *Harbors, *Silting, *Saline water intrusion, Mixing, Sedimentation, Stratified flow, Density currents, Saline water-freshwater interfaces, Dredging, Channel improvement, Desilting, Hydraulic models, Model studies.
Identifiers: Cochin (India).

The Port of Cochin, on the west coast of India has an approach channel 21,000 ft. long and 450 ft. wide, which is maintained to a depth of -32 ft. In order to accommodate super tankers, it is proposed to deepen the channel to -45 ft. and widen it to 600 ft. Because the flood discharges of the various rivers find their way into the sea through the harbor area, strong density effects result from mixing tidal and fresh water flows. The formation of a salt water wedge is responsible for the high rate of siltation at Cochin. The effects of deepening and widening the channel were studied in a saline water model with a fresh water discharge of 66,000 cfs. As a result of the proposed deepening, the salt water wedge would move upstream and there would be an increase in the quantity of maintenance dredging. (Knapp-USGS)

Descriptors: *Tidal effects, *Estuaries, *Currents (Water), Water circulation, Sediment transport, Scour, Sedimentation, Dams, Streamflow, Regime, Hydroelectric plants, Hydroelectric power, Tailwater, Mathematical models.
Identifiers: Douro River (Portugal).

The construction of a dam 20 Km upstream of the mouth of the Douro river, near Oport city in Portugal will sensibly affect the tidal regime of its estuary, resulting as the most noticeable consequence, in a diminished natural flushing ability of the tidal currents. Tidal propagation in the estuary was studied by a finite-difference method. The natural flushing ability of the mouth of the river during dry season, for a spring tide, with a constant turbine discharge, is of the order of 50% of that corresponding to the natural river regime. This value falls to 20% when the turbine discharge is concentrated in a four hour period during low-water. Flushing increases to 120% when the discharge period is centered over mid-ebb. (Knapp-USGS)

DIGITAL COMPUTER CALCULATION OF UNSTEADY OPEN-CHANNEL FLOW (FRENCH),
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
Andre Chervet, and Pierre Dalleves.
In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 1 (Subject A), Science Council of Japan, Kyoto, p 259-266, 1969. 8 p, 6 fig, 6 ref.

Descriptors: *Computer programs, *Unsteady flow, *Open channel flow, *Flood forecasting, *Waves (Water), Discharge (Water), Model studies, Surf, Bores, Hydrographs, Surges.
Identifiers: Method of characteristics.

An example is given of the use of digital computers in the numerical treatment of unsteady flow in open channels. A computer program was written at the Swiss Federal Laboratory for Hydraulic Research to calcuiate the flood resulting from the sudden release of storage water. It also calculates the propagation of long waves on a beach. The computation is carried out by the method of characteristics. The program calculates the path of the wave-front, the flooded areas, water levels, and discharge at any time and distance. In order to determine the limits of validity for the computing method, a comparison between the results of computation and model studies was made for the sudden release of storage water in an extremely steep and irregular alpine valley. The results of computation are in good agreement with the measured values. (Knapp-USGS)

ON THE SIMULATION OF RIVER-BED VARIATION BY CHARACTERISTICS,
Public Works Research Inst., Tokyo (Japan).
Kyozo Suga.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 1, (Subject A), Science Council of Japan, Kyoto, p 289-296, 1969. 8 p, 4 fig, 2 ref.

Descriptors: *Unsteady flow, *Streamflow forecasting, *Mathematical studies, *Open channel flow, Waves (Water), Surges, Channel morphology, River beds.
Identifiers: Method of characteristics.

The characteristics method was applied to river-bed analysis for the cases of unsteady flow in rectangular channels and steady flow in compound channels. In normal calculation of river-bed variation, water current is often treated as steady flow with sufficient precision, even when flood waves and tidal levels are considered. However, when release of stored water is the source of unsteadiness, as in collapse of dams or the break of estuary sandy areas, no simplifications in basic equations are desirable. (Knapp-USGS)

DETERMINATION OF COEFFICIENTS OF HYDRAULIC LOSS FOR UNSTEADY OPEN CHANNEL FLOW (FRENCH),
Technische Universitaet, Dresden (East Germany).
Marcel Bahler.
In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 1 (Subject A), Science Council of Japan, Kyoto, p 181-188, 1969. 9 p, 2 fig, 2 tab.

Descriptors: *Unsteady flow, *Open channel flow, Mathematical studies, Equations, Head loss, Stage-discharge relations, Dam failure, Floods, Flood forecasting, Waves (Water), Surges, Simulation analysis, Model studies, Hydraulic models, Bores.
Identifiers: Unsteady open-channel flow.

In general, coefficients of hydraulic losses based on steady flow are used in the calculation of unsteady flow in open channels. This, theoretically as well as in practice, results in errors. In this paper a method is described for the determination of the coefficients of unsteady flow. Experiments which simulate the sudden and complete break of dams confirm the theoretical assumptions. (Knapp-USGS)

SIMULATION OF THE BAVARIAN REACH OF THE DANUBE RIVER,
Technische Hochschule, Munich (West Germany).
Wolfram Bauch.
French summary. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 1 (Subject A), Science Council of Japan, Kyoto, p 385-394, 1969. 10 p, 4 fig, 1 ref.

Descriptors: *Simulation analysis, *Mathematical models, *Flood routing, Streamflow forecasting, Water levels, Floods, Water management (Applied), River training, Navigation, Flood control.
Identifiers: Danube River.

The training works of the Bavarian part of the Danube River are planned to obtain better conditions for navigation. The necessary width and depth of the channel can only be achieved by means of banking. The result is an acceleration of the movement of flood waves. In order to know in advance the flood-conditions due to the training works, a mathematical model is used which simulates flood-wave-propagation. An example for application of the mathematical model is given in a 60 km reach of the river for the 1954 flood. (Knapp-USGS)

SUBCRITICAL FLOW AT OPEN CHANNEL STRUCTURES - OPEN CHANNEL EXPANSIONS,
Utah Water Research Lab., Logan.
Lloyd H. Austin, Gaylord V. Skogerboe, and Ray S. Bennett.
Available from the NTIS as PB-195 928, $3.00 in paper copy, $0.95 in microfiche. Utah Water Research Laboratory Report PRWG71-1, August 1970. 78 p, 51 fig, 7 tab, 24 ref, append. OWRR Project No B-018-UTAH (1).

Descriptors: *Open channel flow, *Subcritical flow, *Model studies, *Channel morphology, *Ex-

pansion, Mathematical studies, Equations, Flow characteristics, Head loss, Flow rates, Velocity, Flow profiles.
Identifiers: *Specific energy.

Analyzing the hydraulics of open channel constrictions has been modified to allow the analysis of energy loss in open channel expansions. The modified subcritical flow technique has been compared with previous methods of analysis using data collected in the laboratory on open channel expansions with vertical walls, and triangular-shaped baffles. Also, a design procedure for such baffled outlet structures has been developed. The expansion ratio has a significant influence upon the hydraulic characteristics of open channel expansions. As the expansion ratio is increased, the degree of nonuniformity of velocity distributions in the expansion structure will increase with consequent increases in energy loss. Any flow instability at the inlet will become more aggravated as the flow moves through the expansion. Thus, the flow at the outlet will be improved if uniform flow with uniform velocity distribution occurs at the inlet. Although such ideal flow conditions cannot usually be expected under field conditions, they can serve as a goal for the hydraulic engineer. (Woodard-USGS)

EXPERIMENTAL STUDIES OF FLOWS WITH HIGH SOLID PARTICLE CONCENTRATIONS,
M. V. Pechenkin.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2 (Subject B), Science Council of Japan, Kyoto, p 157-164, 1969. 8 p, 4 fig, 1 tab, 9 ref.

Descriptors: *Sediment transport, *Pipe flow, *Design flow, Mathematical studies, Equations, Closed conduit flow, Turbulent flow, Pipelines, Sediment distribution, Hydraulics, Kinetics, Suspended load, Particle size, Flow rates, Foreign projects.
Identifiers: *Leningrad (USSR).

Experimental studies by the Laboratory of Hydraulic Transport of Solids in Leningrad, U.S.S.R., on the turbulence characteristics in pipe flows with high sediment concentrations resulted in establishing the relationship between the distribution of suspended particle concentrations and vertical fluctuating velocity components. Experimental studies of flows with high concentrations established the influence of particle concentration on the fluctuation characteristics of the fluid motion. Integration of the continuity equation for the solid phase of the suspension flow incorporating experimental relationships led to a calculation formula for sediment distribution over the depth of a horizontal flow. The formula is valid for the whole range of concentration values from zero to maximum value. (Woodard-USGS)

UNIFORM TURBIDITY CURRENT EXPERIMENTS,
Norges Tekniske Hoegskole, Trondheim. River and Harbor Lab.
Einar Tesaker.
French summary. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2 (Subject B), Science Council of Japan, Kyoto, p 1-8, 1969. 8 p, 6 fig, 1 tab, 4 ref.

Descriptors: *Turbidity currents, *Test procedures, *Hydraulic models, *Mathematical studies, Flumes, Clays, Slurries, Sands, Flow, Velocity, Density, Slopes, Discharge (Water), Sediments, Interfaces, Turbidity, Equations, Foreign projects.

An experimental study of continuous turbidity currents was made in a 10 m long tank with a submerged, tiltable flume. Clay slurries with varying amounts of fine sand were discharged continuously during two minute periods into the upper part of the flume. Apparently uniform turbidity currents with well defined interface were created. Velocity and density distributions were measured in sections normal to the flow. Characteristic parameters include slope, discharge, and sediments. Nearly linear density distributions were found in many of the runs. Maximum velocities occurred in the lower third of the currents. Data for the bed and interface shear and the apparent eddy viscosity were caluclated. A discussion of some of the results, and comments to the application of existing 'stability' criteria to turbidity currents are included. (Woodard-USGS)

A STUDY OF THE AIR-WATER INTERFACE IN AIR-ENTRAINED FLOW IN OPEN CHANNELS,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
John M. Killen, and Alvin G. Anderson.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2 (Subject B), Science Council of Japan, Kyoto, p 339-347, 1969. 9 p, 4 fig, 10 ref.

Descriptors: *Air-water interfaces, *Air entrainment, *Flow, *Open channels, Boundaries (Surfaces), Methodology, Electrodialysis, Flow characteristics, Electrodes, Channel morphology, Diffusion, Equilibrium, Turbulence, Equations.
Identifiers: *Analytical expression.

Experimental evidence indicates that the upper boundary of an air-entrained flow is a connected wavy surface rather than a cloud of discrete water droplets. Air is drawn through the rough surface by a process of overturning waves and surface rollers. This entrained air is carried downward by turbulent diffusion against the buoyant forces until an equilibrium is reached giving a stable air concentration distribution. The interface between air and water remains intact and very rough over a great range of flow conditions. The surface waves or irregularities are of random amplitude and of the same order as the total depth of flow. The statistical properties of the interface measured by an electrical probe are described by an analytical expression and related to average air concentrations. (Woodard-USGS)

REPRESENTATION OF NON-GRANULAR BOUNDARIES IN HYDRAULIC MODELS,
Department of State Hydraulic Works, Ankara (Turkey). Research Section.
Yuksel Sayman.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2 (Subject B), Science Council of Japan, Kyoto, p 131-138, 1969. 8 p, 4 photo.

Descriptors: *Sediment transport, *Model studies, *Hydraulic models, *Structure, *Construction materials, *Bentonite, Boundaries (Surfaces), Design, Flow, Spillways, Sediment discharge, Research and development, Foreign projects.
Identifiers: *Ankara (Turkey).

The attributes of bentonite as a material for hydraulic-model boundaries in sediment transport studies is discussed from tests made in the Research Department of the State Hydraulic Laboratories in Ankara, Turkey. Bentonite, a clay substance, can be applied to represent a concrete mass or a rocky block in river beds or rocky bank slopes of river channels and is more suitable than using noncohesive granular materials in large models. By using bentonite, a researcher has an advantage of realizing his ideas on the model in a very short time. He can improve a lot of new variants during a test by breaking off the water of the model for short periods and making necessary troweling, etc., on the bentonite bodies. Examples of applicaton and effects of bentonite in hydraulic models are presented. (Woodard-USGS)

R. Acaroglu, and Walter H. Graf.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2 (Subject B), Science Council of Japan, Kyoto, p 199-202, 1969. 4 p, 2 fig, 5 ref.

Descriptors: *Sediment transport, *Beds under water, *Open channels, *Closed conduit flow, Slopes, Flow rates, Velocity, Dynamics, Turbulent flow, Resistance, Boundaries (Surfaces), Sediment distribution, Hydraulics, Sediments, Particle size.
Identifiers: *Bed forms, *Hydraulic resistance.

Depending on the kind of conveyance system, the determination of the kinds of sediment transport and the related bed forms may serve different purposes. This paper presents two graphs as follows: Figure 1, Typical slope and velocity relationship for free surface flows; Figure 2, Typical slope and velocity relationship for closed conduits. The striking similarities between the slope and mean flow velocity relationships shown in Figures 1 and 2 give valuable support to the existence of a close interrelation between the mechanisms of the two different sediment transport phenomena. (Woodard-USGS)

DISTRIBUTION OF SUSPENDED MATTER AND SIMILARITY CRITERIA IN SETTLING BASINS,
Technical Univ. of Istanbul (Turkey). Dept. of Hydraulic and Water Power.
Kazim Cecen, Mehmetcik Bayazit, and Mutlu Sumer.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 215-225, 1969. 11 p, 5 fig, 6 ref.

Descriptors: *Sedimentation, *Hydraulic similitude, *Hydraulic models, Mathematical models, Diffusion, Turbulence, Dimensional analysis, Settling velocity, Froude number, *Settling basins.
Identifiers: *Sedimentation models.

A mathematical model was established for the settling of suspended grains in a turbulent flow using the law of conservation of matter and employing the assumptions made by Taylor and Elder for turbulent diffusion. The solution of this equation gives an expression for the suspension concentration in a settling basin. This expression is used to determine

the similarity criteria for settling basins. The distribution of concentration is found to depend on three nondimensional variables. Models of settling basins must have Froude similarity, and the settling velocity of the grains must be scaled in the same way as the flow velocity. (Knapp-USGS)

Gyorgy Kovacs.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 25-38, 1969. 14 p, 5 fig, 2 tab, 11 ref.

Descriptors: *Darcys law, *Groundwater movement, Particle size, Particle shape, Porosity, Permeability, Hydraulic conductivity, Hydraulic models, Model studies, Viscosity, Mathematical studies, Froude number, Turbulent flow.
Identifiers: *High-velocity groundwater flow.

The general validity of Darcy's law is discussed; the best formula for calculating Darcy's hydraulic conductivity is the Kozeny-Carman equation. About 300 data from 14 experimental series executed in 4 different laboratories were used for the investigation of homodisperse samples of spheres. Equations of movement characterizing different types of seepage are derived as a function of Reynold's number. The differences are caused by the grains contacting each other not only at a single point, but on various surfaces. Thus the total active surface of grains is smaller than that taken into account for determination of the shape coefficient, and, therefore the samples represent another shape coefficient which differs from the calculated one. Identifiers: *USSR.

Two methods for studying flow characteristics of solids with fluids in pipelines are presented. The first is based on the measurements of the instantaneous velocities and the liquid-solid component consistence in an arbitrary flow point by means of photographs and motion pictures. The second method is based on the hydrodynamic tube measurements of the average longitudinal velocity of a small volume mixture in arbitrary part of two-phase flow. Comparison of the results showed a possibility of an application of the hydrodynamical tubes for the measurements in the two-phase flows. (Woodard-USGS)

THEORETICAL DESCRIPTION OF FREE SURFACE TWO-PHASE FLOW OVER A WAVY BED,
Universidad Central de Venezuela, Caracas. Hydraulics Lab.
Marco Falcon.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 2, (Subject B), Science Council of Japan, Kyoto, p 139-146, 1969. 8 p, 8 ref.

Descriptors: *Sediment transport, *Theoretical analysis, *Free surfaces, *Flow, *Streambeds, Model studies, Channel morphology, Channel flow, Mathematical studies, Equations, Analytical techniques, Sediment load, Suspensions, Particle size, Bed load, Turbulent flow, Flow rates, Flow resistance, Fluid mechanics.
Identifiers: *Wavy channel bed, Erodible bed, Two-dimensional diffusion equation, Caracas (Venezuela).

In Caracas, Venezuela, an analytic model of free surface flow carrying suspended sediment over an erodible bed together with a two-dimensional sediment diffusion equation was used to study the interaction of the sediment and fluid phases. The free surface flow model is based on the potential flow over a two-dimensional, slowly moving, wavy bed with a sinusoidal profile of varying amplitude. The effect of the bed forms on the concentration of sediment within the flow is found and used to obtain the sediment transport rate and the phase shift between it and the bed form profile. Expressions are also found for the rate of amplitude growth and rate of longitudinal displacement of the bed forms. (Woodard-USGS)

A THEORY OF TURBULENCE IN STRATIFIED FLUIDS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Mechanics.
Robert R. Long.
Journal of Fluid Mechanics, Vol 42, Part 2, p 349-365, June 1970. 21 ref.

Descriptors: *Stratified flow, *Turbulence, *Density stratification, Fluid mechanics.
Identifiers: *Richardson number, *Density gradient.

The theoretical analysis of an idealized experiment in which turbulence of a patchy nature is precurred to exist in regions of large Richardson numbers, is presented in this paper. The theory for turbulent flow over a flat plate which is moved and cooled in such a way as to produce constant vertical fluxes of momentum and heat is developed. It is indicated that in a coordinate system fixed in the plate the mean velocity increases linearly with height z above a turbulent boundary layer and the mean density decreases as Z cu, so that the Richardson number is large far from the plate. For this theory the curvature of the density profile states that when the curvature is negative a volume of fluid, thoroughly mixed by turbulence, will tend to flatten out, at a new level well above the original center of mass, thereby transporting heat downward. When the curvature is positive a mixed volume of fluid will tend to fall a similar distance, again transporting heat downward. The relationship between the curvature of the density profile and the transfer of heat suggests that the density gradient near the level of a point of inflection of the density curve will increase locally as time goes on. It is concluded that in natural circumstances, it appears that layers of strong shear and density gradient will tend to

form wherever the curvature of the density profile changes sign. (Herrera-Vanderbilt)

STATISTICAL PROPERTIES OF TURBULENT DENSITY FLUCTUATIONS,
IIT Research Inst., Chicago, Ill.
L. N. Wilson, and R. J. Damkevala.
Journal of Fluid Mechanics, Vol 43, Part 2, p 291-303, August 1970. 10 fig, 7 ref.

Descriptors: *Turbulent flow, *Mass-density fluctuations, *Refractive index, *Density gradient.
Identifiers: *Crossed-beam technique, *Schlieren instrument, *Density fluctuations.

This paper presents the study of the local refractive index fluctuations from which mass-density fluctuations can be inferred directly, both being local properties of a fluid, by employing the crossed-beam correlation technique. The refractive index changes are monitored by using the crossed-beam as a Schlieren instrument, the signals obtained then being a measure of refractive index gradients. Since crossed-beam geometry results in an over integral in the cross-flow direction, these gradients tend to be integrated out and no independent scale-length estimates are then required. Some analysis and experimental results concerning the crossed-beam Schlieren instrument and a description of it is presented. It is established that density fluctuations are related isentropically to the pressure fluctuations, which in turn are driven by inertial fluctuations. A conclusion is that optical cross-correlation techniques can be used with Schlieren instruments to obtain density fluctuation statistics in turbulent flows. (Herrera-Vanderbilt)

LOW-FREQUENCY MODULATION OF THERMAL INSTABILITY,
Imperial Coll. of Science and Technology, London (England). Dept. of Mathematics.
S. Rosenblat, and D. M. Herbert.
Journal of Fluid Mechanics, Vol 43, Part 2, p 385-398, August 28, 1970. 5 fig, 7 ref.

Descriptors: *Temperature gradient, *Buoyancy force, *Flow boundaries.
Identifiers: *Thermal instability, *Temperature fluctuations, *Rayleigh number, Boussinesq equation, *Disturbances in flow.

According to Venezian's paper, an incompressible viscous fluid is confined between parallel horizontal planes, and is of infinite horizontal extent. An equilibrium state is maintained under the action of a vertical temperature gradient, which combines a uniform component together with a component varying sinusoidally in time. It is found that this equilibrium is unstable to small disturbances at certain values of the relevant parameters. A solution is obtained by an approximation method based on the smallness of the amplitude ratio in order to determine the modulating effect of the oscillation on the stability characteristics of the mean gradient. It is concluded that for a certain class of disturbances, those of which linearization is valid and whose initial values are independent of frequency, the periodicity criterion is a sufficient condition for instability. (Herrera-Vanderbilt)

MASS OF HEAT TRANSFER FROM A SOLID BOUNDARY TO A TURBULENT FLUID,
Institut Politehnic Bucuresti (Rumania).
E. Ruckenstein.
Int. Journal of Heat and Mass Transfer, Vol 13, p 1283-1291, Pergamon Press. 10 ref.

Descriptors: *Mass transfer, *Heat transfer, Turbulence, Boundary processes, Turbulent flow, Laminar flow, Temperature, Energy equation, Momentum equation, Diffusion, Reynolds number.
Identifiers: Turbulent heat, Prandtl's equation.

The problem of turbulent heat or mass transfer from a solid boundary is treated by dividing the turbulent flow into two regions. For the region in the immediate vicinity of the wall one uses a physical model proposed previously by the author. In the model one considers the turbulent motion as a succession along the wall of quasi-steady laminar motions each of them having a short path. Compared to the preceding treatment, in the present one takes into account various forms of dependence of the shear stress on the distance y to the wall. For a constant shear stress the case of the turbulent motion in a pipe is obtained, while for a shear stress proportional to y that of turbulent separated flows near the separation point. For the fully turbulent region, Prandtl's equation for the turbulent kinetic energy is used and on its basis one obtains an equation for the turbulent diffusion coefficient and for the mass transfer flux. The equation for the turbulent kinetic energy has allowed to propose a procedure for obtaining information concerning the length x sub o of the laminar path. The form of dependence of the shear stress on the distance from the wall has a great influence on the manner in which the mass transfer coefficient depends on the diffusion coefficient, viscosity and fluid viscosity. (Novotny-Vanderbilt)

THE STABILITY OF STRATIFIED SHEAR FLOWS,
Essex Univ., Colchester (England). Dept. of Mathematics.
M. R. Collyer.
Journal of Fluid Mechanics, Vol 42, Part 2, p 367-377, June 22, 1970. 4 fig, 1 tab, 7 ref.

Descriptors: *Stratified flow, *Shear flow, *Stability, *Jet flow, *Density stratification, Fluid mechanics.
Identifiers: *Richardson number, *Wave equation, *Neutral curve.

In this paper, the study of small perturbations of a parallel shear flow U (z) in an inviscid, incompressible stably stratified fluid of rho (z), for which the principal measure of stability is the Richardson number R, is being presented. A discussion for an arbitrary velocity and density profile is presented, to determine whether a curve of neutral stability has adjacent unstable regions in an (alpha, R) plane, where alpha is the wave number of disturbance. Neutral curves bounding unstable regions are then obtained for a triangular jet flow in conjunction with various density distributions. A comparison is also made between the stability characteristic of jet and shear flows with corresponding density structures and is concluded that the possibility of no unstable waves develop for certain values of N in the uppermost layer appears to be its principal distinction. It is also concluded that: It's evident for any combination of velocity and density profiles studied, the flow is unstable if R A1/4 at any level, unless the unstable wavelengths cannot be excited due to restrictions imposed by the boundary conditions. (Herrera-Vanderbilt)
W71-02061

CHANNEL FLOW INDUCED BY A TRAVELLING THERMAL WAVE,
Colorado Univ., Boulder. Dept. of Aerospace Engineering Sciences.
Chuen-Yen Chow.
Journal of Fluid Mechanics, Vol 43, Part 2, p 419-429, August 1970. 7 fig, 7 ref.

Descriptors: *Thermal conductivity, *Fluid velocity, Channel flow, Fluid motion, Reynolds number.
Identifiers: *Traveling thermal wave, *Induced motion, *Prandtl number, *Thermal boundary conditions.

According to Davey's analysis the results were presented only for the limiting cases in which the frequency of flame rotation was either very low or very high. The purpose of this work is to fill in this gap, within which the fluid speed is much greater and reaches a maximum, and to show the change in mean velocity profile as the frequency increases. The effect of thermal boundary conditions of the flow and shear stress is also analyzed. It was found in previous analysis that the induced fluid motion does not exert a net shear force on either plate when the fluid is bounded by two parallel plates. It is shown in this paper that this is the result of the assured thermal boundary conditions. An analysis is carried out linearized under the assumption that the induced motion is slower than the speed of the heat source. Experiments showed that a mean fluid motion can be induced in a channel by a traveling thermal wave, this mean motion being always in a direction opposite to that of the thermal wave. An analysis is presented to indicate that the induced mean motion is always in a direction opposite to that of the thermal wave and its magnitude increases rapidly with decreasing Prandtl number is zero. (Herrera-Vanderbilt)

DISCUSSION OF DISPERSIVITY TENSOR FOR TURBULENT UNIFORM CHANNEL FLOW,
California Univ., Berkeley.
Hugo B. Fischer.
In: Proceedings, American Society of Civil Engineers, Journal of Hydraulics Division, p 1096-1100, April 1970. 2 fig, 1 tab, 3 ref.

Descriptors: *Channel flow, *Turbulent flow, *Uniform flow, *Diffusion, *Dispersion, Eddies, Turbulence.
Identifiers: *Fickian transport coefficient.

This paper presents a discussion of the work presented by Gedeon Dagan in September, 1969, where the author points out that turbulent mixing coefficient may be considered to be a second order tensor. It is said that neither form can provide an exact representation of the diffusive effects of turbulence, but that in many cases the nature of the physical process is such that the averaged scaler representation is at least as correct as, and sometimes, more correct than, the tensor. It is also discussed that according to the author's conclusion, in three dimensional turbulent flow, the isovels represent a principal axis for a mixing tensor for both mass and momentum. The writer of this discussion does not agree, because whereas the local orientation of the isovels does not reflect the concentration distribution at some distance from a point, the concentration distribution at some distance does affect the local mass transport. Examples and analysis of these discussions are presented. (Herrero-Vanderbilt)

THE NUKES ARE COMING.

Quest, Vol 8, No 2, p 2-21, Apr 1970. 20 p, 12 fig, 1 tab.

Descriptors: Electric powerplants, *Electric power production, Coals, *Nuclear powerplants, *Hydroelectric power, Planning, Safety, Cooling water, Nuclear wastes, Inter-basin transfers, Scheduling, Construction, Transmission lines, Locations, Thermal pollution, Radiation hazards, Cooling towers.
Identifiers: *Nuclear power, *Hydroelectric resources, Nuclear fuels, Pacific Northwest-Southwest Intertie, Nuclear radiation, Fossil fuels.

The Pacific Northwest is about to begin a new era of electric power production. Hydroelectric expansion is nearly at an end, with only a few sites remaining that meet the requirements for a hydro dam. Sites meeting the physical criteria for hydro dam installations are subject to controversy among power-producing agencies, conservationist organizations, and sportsmen groups. Regional power deficits predicted for as early as 1973-74 are alarming. Coal-fired and nuclear-fueled powerplants and attendant problems are discussed. Radioisotope leakage, natural radiation levels, somatic and genetic hazards of radiation, reactor safeguards, and problems of storing spent uranium fuel are reviewed. With the ever-increasing demand for electric energy, nuclear power appears to be the coming source in the Pacific Northwest. (USBR)

Identifiers: Switzerland, *Shotcrete, Underground cavities, *Hongrin Power plant, Switzerland, Tunnel supports, Anchor cables.

The Hongrin underground pumped storage station in Switzerland used prestressed rock anchors and shotcrete lining in the underground powerplant, 450 by 100 ft in plan and with arched ceiling 90 ft high, a total excavated volume of 2.9 million cu ft. Stabilization with prestressed rock anchors is distinguished from the more conventional lining methods by the fact that prestressing creates an active arch in the rock, making it act as its own structural support. Such a structure adapts to rock deformation until the whole mass stabilized completely. Excavation began in small longitudinal galleries following the contour of the arched ceiling; the galleries were made large enough to permit drilling and installing rock anchors, but small enough to minimize scaffolding and bracing. Other advantages of the excavation technique include less rock overbreak, lower labor costs, and improved crew safety. Details of the prestressed rock anchors and the 10-step procedure used in constructing the powerplant are described. (USBR)

COLLECTION OF RECENT USSR NEWSPAPER ARTICLES ON POWER GENERATION AND TRANSMISSION IN THE SOVIET UNION.

USR Power Generation and Transmission, Transl from Russ, Bur Reclam Transl 716, July 1970. 132 p, 26 fig, 6 map.

Descriptors: *Reviews, Foreign construction, Extra high voltage, Extra long distance, *Transmission (Electrical), Electric power, *Power system operations, *Electric power production, Electric powerplants, Electric power costs, Multiple-purpose projects, Project planning, Geography, Powerhouses.
Identifiers: USSR, *Power grids, Power interchange, Interties, International cooperation.

A collection of recent Soviet newspaper articles on the electric power generation and transmission aspects of the efforts of the USSR to meet energy needs is presented. The articles have been translated, and in the case of longer articles of marginal interest, have been abstracted to review Soviet accomplishments of the last decade and plans for the future. The result is a general picture of a huge country with difficult geography trying to stretch the energy ruble to include thermal, hydraulic, tidal, geothermal, and nuclear powerplants, and to transmit the energy produced over long transmission lines across plains, mountains, deserts, taiga forest, and permafrost tundra. Unification of sectional power systems by ehv interties into the United Power System of European Russia was achieved during the last decade; gradual extension to the whole country is the goal for the seventies. Providing power from the energy-rich areas of Siberia to European Russia with enough surplus to export to the Comecon countries via the Mir 400-kv line is a constant problem because the demand for electrical energy and the population are growing not only in the western highly industrialized areas but also in the developing Siberian and Central Asian regions. GRAND COULEE 230- AND 115-KV PIPE-TYPE CABLE SYSTEMS,
Bureau of Reclamation, Denver, Colo.
J. J. Ray, and R. J. Mueller.
Conf Pap No 70 CP 559 - PWR, Inst Elec Electron Eng Summer Power Meet and EHV Conf, Los Angeles, Calif, July 1970. 7 p, 10 fig, 3 ref.

Descriptors: *Electric cables, *Installation, Coolants, Temperature, Aesthetics, Electric power, *Transmission (Electrical), High pressure, Field tests, Costs, Electric insulation, Electrical equipment, Design.
Identifiers: *Pipe-type cables, *Cooling systems, *Insulating oil, *High voltage, Cable terminations, Grand Coulee Powerplant, Wash.

Modification work to existing Grand Coulee electrical facilities consists of six 230-kv and two 115-kv pipe-type cable circuits to serve as the transformer circuits between the powerplants and the 230-kv consolidated switchyard and 115-kv switchyard on the west bank. The circuits replace the original 19 overhead transformer circuits. Design and installation of the high-pressure oil, pipe-type cable systems for Grand Coulee Left and Right Powerplants required consideration of unusual parameters such as the 650 ft of elevation difference between terminals, restricted circuit routing, and variable ambient conditions. The resulting cable construction details, pothead configuration, oil circulation, and cable cooling systems are described. Critical time schedules for energization introduced factors into the installation work, which complicated an already difficult job. Innovative procedures and equipment are described and the effectiveness of skid wire design and cable pulling lubrication are analyzed. (USBR)

PHENOMENON AND MECHANISM OF FROST HEAVING,
Cold Regions Research and Engineering Lab., Hanover, N.H.
C. W. Kaplar.
Highw Res Rec, No 304, p 1-13, 1970. 13 p, 13 fig, 1 tab, 22 ref.

Descriptors: *Frost heaving, *Frost action, Freezing, *Frozen soils, *Frozen ground, Soils, Laboratory tests, Soil structure, Soil pressure, *Heaving, Ice, Soil mechanics, Soil water, Highways, Bibliographies, Negative pressure, Soil water movement.

Identifiers: Liquid films, Ice lenses, Subpressure.

A mechanistic explanation of frost action in soils, based on the hypothesis that liquid films existing between particles and an ice lens are the focal centers of energy for the heaving process, is presented. An explanation of the development of suction forces in unfrozen liquid below the ice lens is presented, and experimental data are provided for closed and open systems. The effect of heat extraction and freezing penetration rates on rate of heaving is discussed. Laboratory data indicate 2 critical rates of freezing: (1) maximum heave rate, and (2) minimal heave rate equal to volume expansion of void water. The role of soil structure in frost susceptibility is discussed. Changes in frost heaving rates can be effected by the addition or removal of either or both coarse aggregate or soil fines. Suggestions are offered for approaches to soil modification to reduce heaving. (USBR)

LOW-TEMPERATURE EFFECTS ON THE COMPACTION AND STRENGTH OF A SANDY CLAY,
Purdue Univ., Lafayette, Ind.
W. H. Highter, A. G. Altschaeffl, and C. W. Lovell, Jr.
Highw Res Rec, No 304, p 45-51, 1970. 7 p, 4 fig, 2 tab, 17 ref.

Descriptors: *Cold weather construction, Earthworks, *Embankments, Soil mechanics, *Compaction, Soil strength, Clays, Statistical analysis, Dry weight, Compressive strength, Axial strain, Temperature, Laboratory tests, Construction, Compaction tests, Bibliographies, Soil structure, Pore water pressures.
Identifiers: Undrained shear strength.

With the feasibility of increased cold weather earthwork as a practical motivation, the compaction and strength characteristics of a sandy clay were studied in the laboratory over a temperature range of 35 to 85 deg F. The soil was compacted at 3 effort levels and at 4 water content levels for each effort level. The strength and stiffness of soil tested at one temperature but compacted at different temperatures increased with increasing compaction temperature. For soil compacted at the same temperature, the strength and stiffness increased with decreasing test temperature. Conclusions were (1) low temperature compaction reduces unit weight and as-compacted undrained strength; (2) compacted samples are stronger and stiffer when tested at low temperatures; (3) low temperature compaction effects can be compensated by increasing the compaction effort; (4) observed trends are probably seated in the factors of soil structure and pore water pressure; and (5) there seems to be no major deterrent to compaction of clayey soils in a cold, but unfrozen, condition. (USBR)

DESIGN AND PERFORMANCE OF PROVISIONS FOR FOUNDATION SEEPAGE CONTROL AT GARDINER DAM,
A. S. Ringheim.
Eng J, Can, Vol 53, No 4, p 17-25, Apr 1970. 9 p, 8 fig, 1 tab, 5 ref, disc.

Descriptors: Dams, *Dam foundations, Dam design, *Earth dams, Cutoff trenches, Seepage, Filters, Previous blankets, Drainage systems, Relief wells, Underseepage, Impervious blankets, Foreign construction, Foreign design practices, Performance, Underwater construction, Drains.

Gardiner Dam is a 210-ft-high, zoned earthfill embankment located in south-central Saskatchewan, Canada. Bedrock at the damsite is impervious Bearpaw Shale that outcrops near river level on both sides of the river. In the river channel, up to 110 ft of stratified pervious sand overlies bedrock. Right abutment overburden is dense, glacial till with layers and pockets of pervious materials. Overburden on the left abutment consists of up to 60 ft of interbedded sand, silt, and clay overlain by 40 to 50 ft of clean, free draining sand and gravel. Several alternatives for seepage control are discussed, including a positive cutoff trench to bedrock, steel sheet piling, and an impervious reservoir blanket. Seepage control measures adopted for the river channel section of the dam were: (1) a reservoir blanket covering the full width of the river and extending 1200 ft upstream from the dam, and (2) a filter blanket and pressure relief wells under the downstream toe of the dam. For the remaining portions of the dam, a positive cut-off trench was constructed to bedrock, and filter blankets and toe drains were constructed under the downstream embankment zones. Provisions for seepage under the spillway and locations and physical features of the entire seepage control system are presented. (USBR)

STABILIZATION OF HYDRAULIC BACKFILL WITH PORTLAND CEMENT: INCLUDING RESULTS WITH OTHER ADDITIVES,
Bureau of Mines, Spokane, Wash.
D. R. Corson.
Report No. RI 7327, Bur Mines, Jan 1970. 33 p, 20 fig, 9 tab, 18 ref.

Descriptors: Soil stabilization, Soil engineering, Soil mechanics, Soil strength, Soil cement, Soil tests, *Hydraulic fills, Effects, Earth materials, Backfill, *Portland cements, *Stabilization, Bibliographies, Compressive strength, Permeability, Admixtures, Regression analysis, Strength, Laboratory tests, Gradation, Cements, Density.
Identifiers: Compression tests, Triaxial tests, Permeability tests, Cement content.

Tests to determine the effect on the strength and permeability of hydraulic backfill by addition of varying amounts of Type I portland cement are described. Unconfined compression, triaxial compression, and permeability test data, and data from tests to determine effects of moist curing and fill densification on strength are given. Two strength prediction equations based on the physical and mineralogical properties of the materials were formulated. The equations accounted for 96 and 99% of the data variability, and yielded reasonable estimates of cemented strengths of materials having properties within the range of those used in the analysis. Gradation and cement content are the primary factors affecting sample strength; silica content is significant only in rich (5 to 1) sand-cement mixes. Triaxial tests showed higher strength for well-graded material and higher cohesion for fine material. Samples moist-cured in plastic bags had significantly lower strengths than comparable samples cured in room atmosphere. An increase in dry density of approximately 10 lb/cu ft resulted in 7-day strength increases of 25 to 67% Permeability decreased with increases in cement content and curing time. Has 18 references. DISTRIBUTION OF STRESSES IN DISCONTINUOUS LAYERED SYSTEMS,
Coyne et Bellier, Paris (France).
V. Maury.
Water Power, Vol 22, No 5/6, p 195-202, May/June 1970. 8 p, 10 fig, 1 tab, 10 ref.

Descriptors: *Stress distribution, Stress analysis, Discontinuities, *Rock foundations, *Rock mechanics, Dam foundations, Deformation, Model studies, Stability, Theoretical analysis, Photoelasticity, Model tests, Interferometers, Models, Research and development, Friction, Foreign research.
Identifiers: Rock interfaces, Photoelastic interferometer, Comparative studies, France, Photoelastic model material.

Because of the complexity of determining stress patterns in rock foundations, deformation and stability of rock foundations for dams are based on approximate assumptions. Rock is assumed to be a continuum even though the fundamental characteristic of rock is that of discontinuity. A research program to investigate the stress distribution in discontinuous systems under applied loads is described. A theoretical method of analysis suitable for calculating stresses in stratified systems for cases of perfect bonding or perfect sliding between layers is presented. The method cannot be used for cases of friction between layers. Tests of photoelastic and interferometric models were used to check the theoretical analysis and to investigate the effect of different degrees of friction between layers. Assumptions used in the theoretical analysis that need refinement to reflect accurately the state of stress can be identified by comparing theoretical and experimental results. Then the model can be used to examine the change in mode of reaction when there is friction between layers. (USBR)

FAST-RESPONSE EQUIPMENT FOR ACOUSTIC LOGGING,
V. G. Gratinskii.
Phys Solid Earth, No 12, p 768-774, Dec 1969. 7 p, 6 fig, 15 ref.

Descriptors: *Borehole geophysics, Boreholes, Geophysics, Analogs, Seismographs, Oscilloscopes, Rock properties, *Acoustic equipment, Drill holes, *Logging (Recording), *Subsurface investigations, Exploration, Bibliographies.
Identifiers: *Acoustic logging, Geophysical logging, Probes (Instruments), Elastic waves.

An experimental model of a type of fast response equipment for investigating physical and mechanical properties of rocks in boreholes was developed. The equipment records in analog form a maximum of information on the acoustic signals at individual points of a borehole and obtains continuous diagrams indicating the variation of the most important signal parameters along the profile. All observations are made while the probe moves at a constant rate in the borehole. The equipment has improved characteristics of the acoustic elements lowered into the borehole emitters, pickups, and acoustic insulators. Field tests showed that the equipment works reliably even in profile sections which greatly complicate the investigatons, namely in rocks characterized by low velocities and high absorption of the elastic waves. CONCRETE PLACEMENT (SPLIT LEVEL - NO VERTICAL JOINT SCHEME),
O. R. Lunn.
Pap, Conf Rapid Constr Concr Dams, Asilomar, Calif, Mar 1970. 15 p, 5 fig.

Descriptors: *Concrete dams, *Concrete placing, Concrete construction, Mass concrete, Temperature control, Dam construction, Dams, Construction costs, Monoliths, Construction joints, Construction, Cooling, Vertical joints, *Formwork (Construction), Lifts (Construction).
Identifiers: *Construction methods, Precast concrete forms, Cost savings.

A method of constructing concrete dams using insulated, precast concrete panels as upstream and downstream forms and a concrete placing method that eliminates vertical joints is presented. Technical and construction advantages of using the precast concrete forms are tabulated. The concrete placing method consists of placement of 65-ft-wide blocks or monoliths in 5-ft lifts with overlapping edges. To minimize the slope area of the overlapping edges, a split-level concept is used, consisting of placing alternate blocks and keeping the difference of top elevation of adjacent blocks at one-half lift height. Pipe cooling is provided for temperature control. The method allows an almost level surface throughout construction, making the top of the dam a safer place to work; concrete placement is easier and can be expected to result in more consistent quality; all formwork on top of the dam consists of placing precast panels; and continuous placing of concrete by belt conveyors is more feasible. Estimated savings using the method is one dollar per cu yd of concrete for large dams. (USBR)

TECHNOLOGY OF CONSTRUCTING CANALS WITH POLYMER MEMBRANE LININGS,
V. V. Zherebtsov, T. A. Chapurskaia, and V. I. Romashkevich.
Transl from Russ, Bur Reclam Transl 840, July 1970. 30 p, 5 fig, 4 tab, disc. Gidrotekh melior, No 6, p 17-25, 1969, and No 2, p 23-24, 1970.

Descriptors: *Canal design, Earth handling equipment, Lower cost canal linings, *Excavation, *Foreign construction, *Buried membranes, Canals, *Canal linings, Impervious membranes, Trenches, Comparative costs, Canal embankments, Polymers, Mechanization, Soil compaction, Polyethylenes, Costs, *Canal construction, Construction materials, Construction.
Identifiers: USSR, *Construction methods, Seepage control, Protective coverings, Plastic film.

With the objective of maximum mechanization, construction technology for placing polyethylene membrane linings in canals has been developed in the USSR. The trench and the perimeter methods were developed for canals in thorough and partial cuts for cohesive, nonsettling soils having high seepage coefficients. The perimeter method can also be used in rocky soils by constructing a layer of fine-grained soil on which to place the membrane. Both methods are described, including sequence of operations and construction equipment. Basic operations for the trench method are: (1) excavate the trench for membrane placement, (2) place the membrane, (3) backfill the trench, and (4) excavate the canal cross section. Basic operations for the perimeter method are: (1) excavate the canal cross section, (2) place the membrane, and (3) place the earth cover. Canal construction in several standard sizes was studied for the methods. Construction output per man-day was about the same as mechanized construction of monolithic concrete linings. Excluding earthwork costs, monolithic concrete lings cost 1.5 to 3 times more than polyethylene membrane linings. A discussion is included suggesting that earthwork costs could be cut in half and hand trimming eliminated by using rotary screw excavators. (USBR)

A TRACER STUDY OF PRESCALING DEPOSITION OF SCALE FORMING COMPOUNDS ON CONTROLLED SURFACES,
North American Rockwell Corp., Canoga Park, Calif. Atomics International Div.
Howard L. Recht.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D.C. 20402. Price $0.40. Office of Saline Water Research and Development Progress Report No. 521.

Descriptors: *Scaling, *Calcium Sulfate, *Radioactivity, *Heat Exchangers, Tracers, Desalination, Distillation, Scaling, Corrosion.
Identifiers: Autoradiography, Nucleation, Induction, Radioactive Calcium.

The chemistry and physics were studied of the induction period in the heterogeneous nucleation of heat-exchanger scale to elucidate the mechanism and energetics of the surface influenced processes which are occurring, Solutions of calcium sulfate tagged with radioactive calcium-45 were placed in contact with metal wafers which served as models for heat exchanger surfaces. The level of surface radioactivity after rinsing was related to the amount of calcium sulfate adsorbed on the metal surface. The amounts so adsorbed, at concentration levels below that of bulk deposition can be measured quantitatively. Experiments conducted over a range of solution concentrations, temperatures, and exposure periods yielded adsorption isotherms and adsorption rates. Adsorption studies were conducted on copper and on 90-10 Copper-Nickel alloy. Surfaces were prepared by grinding, polishing, ultrasonic cleaning and thermal etching in the temperature range 125 to 225 F. (Fillian-OSW)

W. C. Cooley, and L. L. Clipp.
Trans Amer Soc Mech Eng, J Eng Ind, Vol 92, Ser B, No 2, p 281-287, May 1970. 7 p, 14 fig.

Descriptors: *High pressure, *Jets, *Rock excavation, Tunneling, *Underwater excavation, Research and development, Fragmentation, Mining, Kinetic energy, Overbreak, Shock waves, Penetration.
Identifiers: *Jet piercing, Rock breakage, Pulsating jets, Wear, Tooling, Rapid excavation, Undersea aqueduct (Collective).

Research on pulsed high-pressure water jets in their application to breaking rock is reviewed. Experiments show the input energy per unit volume required to fracture various types of rock as a function of the pertinent variables. The stagnation pressure of the liquid jets was varied from 50,000 to 5 million psi. Theories of jet penetration through water and air are compared with experimental results. The feasibility and potential advantages of using pulsed water jet equipment for ocean-floor excavation are discussed. Conclusions are that pulsed water cannons offer a promising potential for remote-controlled or manually controlled underwater excavation. The operating jet pressure should be optimum for the type of rock being excavated. Much research and development is needed to optimize a complete underwater excavation system. Potential advantages of continuous remote-control-led operation, flexibility of operation, and absence of tools that wear out make the system attractive for further investigation. (USBR)

CRITERIA FOR RECOGNITION OF ESTUARINE WATER POLLUTION BY AERIAL REMOTE SENSING,
W71-01900 05B

AEROBIC CONDITIONS
OPERATING CHARACTERISTICS OF TWO AEROBIC-ANAEROBIC DAIRY MANURE TREATMENT SYSTEMS,
W71-02011 05D

ON-SITE COMPOSTING OF POULTRY MANURE,
W71-02013 05D

AEROBIC TREATMENT
FERMENTATION INDUSTRY-PHARMACEUTICAL, CORN, SUGAR, (LITERATURE REVIEW),
W71-01760 05D

MEAT AND POULTRY PROCESSING WASTES (LITERATURE REVIEW),
W71-01761 05D

WASTE TREATMENT BY AEROBIC TECHNIQUES,
W71-01765 05D

CANNING (LITERATURE REVIEW),
W71-01977 05D

AEROBIC TREATMENT OF SWINE WASTE,

W71-02010 05D

AEROSOLIC DUST
EOLIAN SEDIMENT INFLUENCE ON PEDOGENESIS DURING THE QUATERNARY,
W71-01709 02G

AGRICULTURAL ENGINEERING
AN ENGINEERING-ORIENTED MODEL OF WATERSHED HYDROLOGY,
W71-01821 02A

AGRICULTURAL POLLUTION
SEEPAGE OF FEEDYARD RUNOFF WATER IMPOUNDED IN PLAYAS,
W71-01705 05A

AIR CHAMBERS
PRESSURE SURGE ATTENUATION UTILIZING AN AIR CHAMBER,
W71-01732 08B

AIR ENTRAINMENT
SURGE AND AIR ENTRAINMENT IN PIPELINES,
W71-01737 08B

A STUDY OF THE AIR-WATER INTERFACE IN AIR-ENTRAINED FLOW IN OPEN CHANNELS,
W71-01926 08B

AIR POLLUTION
COMMENTARY IN SOVIET PERIODICALS ON ENVIRONMENTAL POLLUTION,
W71-01688 05G

DIVISION OF ISOTOPES DEVELOPMENT RESEARCH AND DEVELOPMENT PROJECTS 1969.
W71-01881 05A

AIR SPACE
MICROCLIMATE BEFORE AND AFTER IRRIGATION,
W71-01720 02I

AIR-WATER INTERFACES
A STUDY OF THE AIR-WATER INTERFACE IN AIR-ENTRAINED FLOW IN OPEN CHANNELS,
W71-01926 08B

ALABAMA
GREENFIELD V POWELL (TITLE TO ACCRETED PROPERTY).
W71-01668 06E

FLOOD PLAIN INFORMATION, BIG WILLIS CREEK, VICINITY OF GADSDEN, ALABAMA.
W71-01916 04A

BURKE V SOUTHERN BELL TEL AND TEL CO (LIABILITY OF UTILITY COMPANY FOR OBSTRUCTION OF RIVER).
W71-02161 06E

GULF STATES STEEL CO V LAW (LIABILITY FOR FLOOD DAMAGE BY DAM OWNER).
W71-02166 06E

ALGAE
MACROPHYTES OF THE SAKHALIN SEA COAST,
W71-01699 02L

THE VEGETATION OF SUPERFICIAL IRONSTONE HARDPANS IN SIERRA LEONE,
W71-01710 02G

WATER QUALITY CONTROL WITH SYNTHETIC POLYMERIC FLOCCULANTS,
W71-01899 05D

ALGAL MATS
THE VEGETATION OF SUPERFICIAL IRONSTONE HARDPANS IN SIERRA LEONE,
W71-01710 02G

ALKALINE SOILS
DIAGNOSIS OF SODIC CONDITIONS IN SALINE-ALKALI SOILS OF WESTERN RAJASTHAN,
W71-01706 02G

ALKALINE WATER
ALKALINITY AND FORMATION OF ZEOLITES IN SALINE ALKALINE LAKES,
W71-01903 02H

ALKYLPOLYGLYCOL ETHERS
STUDIES ON THE ACTION OF HIGH CONCENTRATIONS OF ALKYLPOLYGLCYCOL ETHERS ON FISH (GERMAN),
W71-01860 05C

ALLUVIAL CHANNELS
SOME MORPHOMETRICAL RELATIONSHIPS IN THE MIDDLE AND LOWER REACHES OF THE AMU DARYA,
W71-01779 08B

A BASIC CAUSE OF A BRAIDED CHANNEL,
W71-01781 02J

ALL-CONCENTRATE RATION
COPROPHAGY AND USE OF ANIMAL WASTE IN LIVESTOCK FEEDS,
W71-02024 05D

ALTERATION OF FLOW
CHESAPEAKE AND O RY V RICE (LIABILITY FOR DAMAGE TO LAND FROM DRAIN OBSTRUCTION).
W71-02130 06E

ILHENNY V BROUSSARD (DIVERSION OF WATERS FROM NAVIGABLE STREAMS).
W71-02170 06E

AMBIENT FLUID
EFFLUENT FROM A SLOT INTO STAGNANT OR MOVING AMBIENT FLUID OF GREATER DENSITY,
W71-01961 05G

AMINES
AMMONIA AND AMINES COMPONENTS OF SWINE-BUILDING ODOR,
W71-02041 05A

AMMONIA
PERVAPORATION OF VOLATILE POLLUTANTS FROM WATER USING SELECTIVE HOLLOW FIBERS,
W71-01759 05D

AMMONIA AND AMINES COMPONENTS OF SWINE-BUILDING ODOR,
W71-02041 05A

AMORTIZATION
AMORTIZATION OF NONCONFORMING USES IN FLOOD PLAINS,
W71-02151 06F

ANAEROBIC CONDITIONS
ANAEROBIC TREATMENT OF WASTES,
W71-01758 05D

OPERATING CHARACTERISTICS OF TWO AEROBIC-ANAEROBIC DAIRY MANURE TREATMENT SYSTEMS,
W71-02011 05D

PRIMARY TREATMENT OF SWINE WASTES BY LAGOONING,
W71-02014 05D

DESIGN CRITERIA FOR ANAEROBIC LAGOONS FOR SWINE MANURE DISPOSAL,
W71-02015 05D

ANAEROBIC DIGESTION
ANAEROBIC TREATMENT OF WASTES,
W71-01758 05D

DIGESTION FUNDAMENTALS APPLIED TO DIGESTER RECOVERY--TWO CASE STUDIES,
W71-01856 05D

CANNING (LITERATURE REVIEW),
W71-01977 05D

CATTLE-MANURE TREATMENT TECHNIQUES,
W71-02016 05D

ANAEROBIC LAGOONS
PRIMARY TREATMENT OF SWINE WASTES BY LAGOONING,
W71-02014 05D

CATTLE-MANURE TREATMENT TECHNIQUES,
W71-02016 05D

ANALOG COMPUTERS
A STEADY STATE OPTIMAL DESIGN OF ARTIFICIAL INDUCED AERATION IN POLLUTED STREAMS BY THE USE OF PONTRYAGIN'S MINIMUM PRINCIPLE,
W71-02095 05G

ANALOG MODELS
THE SIMULATION OF THE MOVEMENT OF AN INTERFACE BETWEEM SALT AND FRESH WATERS IN A COASTAL AQUIFER BY THE AID OF AN RC ANALOG,
W71-01941 07A

ANALOGS
TECHNIQUES TO EVALUATE THE TRANSIENT PERFORMANCE OF CABLES AND JOINTS,
W71-01729 08C

ANALYTIC TECHNIQUES
MATHEMATICAL MODELS OF LOCATION A REVIEW,
W71-02111 06A

SYSTEMS ANALYST'S VIEW OF NOISE AND URBAN PLANNING,
W71-02145 06A

ANALYTICAL EXPRESSION
A STUDY OF THE AIR-WATER INTERFACE IN AIR-ENTRAINED FLOW IN OPEN CHANNELS,
W71-01926 08B

ANALYTICAL TECHNIQUES
THE APPLICATION OF PHASE SELECTIVE ALTERNATING CURRENT POLAROGRAPHY TO THE ANALYSIS OF HEAVY METALS IN WATER,
W71-01895 05A

DESIGN OF A HYDROLOGIC CONDITION SURVEY USING FACTOR ANALYSIS.
W71-02085 04D

CHAPTER VI SPECIAL PROBLEMS OF METROPOLITAN WATER RESOURCES ANALYSIS.
W71-02136 06B

CHAPTER X, DEVELOPMENT OF A RESEARCH PROGRAM ON THE EVALUATION PROCESS.
W71-02140 06B

ANCHORS
PRESTRESSED ROCK ANCHORS AND SHOTCRETE FOR LARGE UNDERGROUND POWERHOUSE,
W71-01735 08C

THE GEORGIE (LIABILITY FOR DAMAGE FROM INJURY TO SUBMARINE COMMUNICATIONS CABLE).

W71-02165 06E

ANEMOMETERS
THE TURBULENCE WITH FINE PARTICLES IN UPWARD FLOW,
W71-01938 02J

ANGIOSPERMS
IS ANY ANGIOSPERM AN OBLIGATE HALOPHYTE,
W71-01714 02I

ANIMAL PATHOLOGY
STUDIES ON THE ACTION OF HIGH CONCENTRATIONS OF ALKYLPOLYGLCYCOL ETHERS ON FISH (GERMAN),
W71-01860 05C

ANKARA(TURKEY)
REPRESENTATION OF NON-GRANULAR BOUNDARIES IN HYDRAULIC MODELS,
W71-01927 08B

ANNUAL COST
ECONOMIC EVALUATION OF LIQUID-MANURE DISPOSAL FOR CONFINEMENT FINISHING OF HOGS,
W71-02028 05E

ANTIMYCIN A
INTERACTION OF ANTIMYCIN A AND ROTENONE IN FISH BIOASSAYS,
W71-01862 05C

TOXICITY OF RHODAMINE B AND FLUOREXCEIN SODIUM TO FISH AND THEIR COMBATABILITY WITH ANTIMYCIN A,
W71-01863 05C

AQUARIA
THE USE OF COPPER SULFATE AS A MEDICAMENT FOR AQUARIUM FISHES AND AS AN ALGAECIDE IN MARINE MAMMAL WATER SYSTEMS,
W71-01868 05C

AQUIFERS
GROUNDWATER IN THE POTOMAC RIVER BASIN,
W71-01815 02F

AREA PLANNING AND DEVELOPMENT
A MASTER PLAN REPORT FOR THE ATLANTIC COUNTY NEW JERSEY PLANNING BOARD, WATER AND SEWER STUDIES.
W71-01875 05D

ARID LANDS
DIAGNOSIS OF SODIC CONDITIONS IN SALINE-ALKALI SOILS OF WESTERN RAJASTHAN,
W71-01706 02G

MICROCLIMATE BEFORE AND AFTER IRRIGATION,
W71-01720 02I

ARKANSAS
POINSETT LUMBER AND MFR CO V UNITED STATES (COMPENSATION FOR PHYSICAL INVASION OF PRIVATE PROPERTY BY GOVERNMENT PROJECTS).
W71-02114 06E

ANDERSON V REAMES (RIPARIAN RIGHTS OF LAKE PROPERTY OWNER)
W71-02119 06E

KILGO V COOK (OWNERSHIP OF BEDS OF NON-NAVIGABLE STREAMS).
W71-02125 06E

ARTIFICIAL PRECIPITATION
LARGE SCALE DYNAMIC EFFECTS OF CLOUD SEEDING,
W71-01672 03B

ARTIFICIAL RECHARGE
ARTIFICIAL GROUNDWATER RECHARGE THROUGH BASINS IN THE TEXAS HIGH PLAINS,
W71-01719 04B

STUDY OF GRCUNDWATER MOUNDS UNDER SPREADING AREAS,
W71-01936 04B

ARTIFICIAL WATERCOURSES
SCRANTON-PASCAGOULA REALTY CO V CITY OF PASCAGOULA (ARTIFICIAL CHANNEL MAY BECOME WATERCOURSE BY PRESCRIPTION).
W71-02173 06E

ASSETS
SWINE MANURE -- LIABILITY OR ASSET,
W71-02047 05D

ASSIMILATION
COMPARATIVE PHOTOSYNTHESIS, GROWTH AND TRANSPIRATION OF TWO SPECIES OF ATRIPLEX,
W71-01708 02I

ASYMMETRIC MEMBRANES
SECOND REPORT ON DEVELOPMENT OF IMPROVED CELLULOSE ACETATE MEMBRANES FCR REVERSE OSMOSIS,
W71-01746 03A

ATLANTIC COUNTY(NEW JERSEY)
A MASTER PLAN REPORT FOR THE ATLANTIC COUNTY NEW JERSEY PLANNING BOARD, WATER AND SEWER STUDIES.
W71-01875 05D

ATLANTIC PACIFIC INTEROCEANIC CANAL
BIOENVIRONMENTAL AND RADIOLOGICAL-SAFETY FEASIBILITY STUDIES ATLANTIC-PACIFIC INTEROCEANIC CANAL. DARIEN FISH DIETARY,
W71-01884 05C

ATTENUATICN
PRESSURE SURGE ATTENUATION UTILIZING AN AIR CHAMBER,
W71-01732 08B

ATTITUDES
ACCESSIBILITY AND ENVIRONMENTAL QUALITY,
W71-02155 06B

AUSTRALIA
PRODUCTIVITY STUDIES ON HEATH VEGETATION IN SOUTHERN AUSTRALIA. THE USE OF FERTILIZER IN STUDIES OF PRODUCTION PROCESSES,
W71-01712 02I

THE ANALYSIS OF THE FLOW OF LAYERED FLUIDS,
W71-01959 02L

AVERAGE DAILY GAIN
UTILIZATION OF ANIMAL WASTE AS FEED FOR RUMINANTS,
W71-02023 05D

AVERAGE FLOW
MEAN ANNUAL RUNOFF AS RELATED TO CHANNEL GEOMETRY OF SELECTED STREAMS IN CALIFORNIA,
W71-01906 02E

BACKWATER
HOGAN V PENNSYLVANIA RR (ALLEGEDLY INADEQUATE CONDUIT NOT PROXIMATE CAUSE OF FLOODING).
W71-01874 06E

PIKE RAPIDS POWER CO V SCHWINTEK (SPECIFIC PERFORMANCE OF CONTRACT TO CONVEY FLOWAGE RIGHTS).
W71-02181 06E

BEAVERTON POWER CO V WOLVERINE POWER CO (BREACH OF ORAL CONTRACT TO CONVEY FLOWAGE RIGHTS).
W71-02182 06E

BACTERIA
PLAQUING AND IMMUNOLOGICAL METHODS FOR DETECTION AND IDENTIFICATION OF ENTEROVIRUSES,
W71-01651 05A

CONTROL MECHANISMS OPERATIVE IN A NATURAL MICROBIAL POPULATION SELECTION FOR IT'S ABILITY TO DEGRADE L-LYSINE,
W71-01838 05D

WATER QUALITY CONTROL WITH SYNTHETIC POLYMERIC FLOCCULANTS,
W71-01899 05D

BAGGING
POULTRY MANURE MARKETING,
W71-02030 05D

BANK EROSION
LOUISVILLE AND N RR V SALTZER (RAILROAD'S LIABILITY FOR BANK EROSION CAUSED BY REROUTING OF RIVER).
W71-01744 06E

BANKS
COLE V PITTSBURGH AND L E RR (LOCATION OF BOUNDARY ON NON-NAVIGABLE STREAM).
W71-02089 06E

LANGERIN V FLETCHER (INTERPRETATION OF 'BANK' AS PROPERTY BOUNDARY).
W71-02196 06E

BARRIERS
MICROMETEOROLOGICAL INVESTIGATIONS OF THE ENERGY BUDGET EFFECT OF SUMMER WINDS,
W71-01889 02D

BASE FLOW
AN EVALUATION OF STREAMFLOW TIMING FROM SMALL WATERSHED IN NORTHEASTERN UNITED STATES,
W71-01917 02E

BASIN PLANS
CHAPTER II PREPARATION OF REGIONAL, BASIN AND STATE PLANS,
W71-02122 06B

BEACHES
JACKVONY V POWEL (PUBLIC PASSAGE BETWEEN HIGH AND LOW WATER MARKS).
W71-02192 06E

BED FORMS
THE EFFECT OF BED FORMS ON THE HYDRAULIC RESISTANCE,
W71-01931 08B

BED LOAD
ON THE GEOMETRICAL CHARACTERISTICS OF SAND WAVES,
W71-01783 08B

BEDS UNDER WATER
THE EFFECT OF BED FORMS ON THE HYDRAULIC RESISTANCE,
W71-01931 08B

CITY OF COVINGTON V STATE TAX COMM'N (ASSESSMENT OF SUBMERGED LAND FOR TAXING PURPOSES).
W71-02127 06E

BEET PROCESSING INDUSTRY
AN ECONOMIC STUDY OF THE EFFECT OF MUNICIPAL SEWER SURCHARGES ON INDUSTRIAL WASTES,
W71-01897 05G

BENEFICIAL USE
TOTAL DOLLAR BENEFIT OF WATER POLLUTION CONTROL,
W71-02116 05G

BENEFITS
TOTAL DOLLAR BENEFIT OF WATER POLLUTION CONTROL,
W71-02116 05G

STORM WATER FOR FUN AND PROFIT,
W71-02150 06B

BENTONITE
REPRESENTATION OF NON-GRANULAR BOUNDARIES IN HYDRAULIC MODELS,
W71-01927 08B

BERYLLIUM
RAPID ANALYTICAL METHODS FOR THE INVESTIGATION OF METALS AND INORGANIC RAW MATERIALS. XII. DETERMINATION OF TRACE AMOUNTS OF BERYLLIUM IN MINERAL WATERS AND MINERALS,
W71-01990 02K

BIBLIOGRAPHIES
COASTAL/ESTUARINE POLLUTION, AN ANNOTATED BIBLIOGRAPHY,

CHEMICAL OXYGEN DEMAND
CONTROL MECHANISMS OPERATIVE IN A NATURAL MICROBIAL POPULATION SELECTION FOR IT'S ABILITY TO DEGRADE L-LYSINE,
W71-01838 05D

DESIGN CRITERIA FOR ANAEROBIC LAGOONS FOR SWINE MANURE DISPOSAL,
W71-02015 05D

MODELING FEEDLOT RUNOFF POLLUTION,
W71-02040 05B

CHLORIDE
FLOCCULATION OF COLLOIDS WITH POLYELECTROLYTES IN AQUEOUS SALT SOLUTIONS,
W71-01901 05D

CHLORINATION
DISINFECTION (LITERATURE REVIEW),
W71-01764 05D

CHLORINE
DISINFECTION (LITERATURE REVIEW),
W71-01764 05D

CHROMIUM FOAM FRACTIONATION
FOAM SEPARATIONS FOR INDUSTRIAL WASTES PROCESS SELECTION,
W71-01843 05D

CITIES
URBAN PLANNING AND DEVELOPMENT OF RIVER CITIES,
W71-02153 06B

CITY OF SHREVEPORT V WILKINSON (CONSTITUTIONALITY OF ORDINANCE DENYING ACCESS TO LANDOWNER'S HOME).
W71-02169 06E

CITY PLANNING
PLANNING STANDARDS FOR STORM DRAINAGE,
W71-02146 04A

COMMUNITY DECISION STRUCTURE AND URBAN PLANNING PROCESS,
W71-02152 06B

URBAN PLANNING AND DEVELOPMENT OF RIVER CITIES,
W71-02153 06B

CIVIL ENGINEERING
COST-EFFECTIVENESS ANALYSIS OF CIVIL ENGINEERING SYSTEMS NEW YORK CITY'S PRIMARY,
W71-02083 06B

CLARIFICATION
SINGLE-STAGE LIME CLARIFICATION OF SECONDARY EFFLUENT,
W71-01969 05D

CLAYS
SOIL MOISTURE CHARACTERISTICS OF INDIAN GRUMOSOLS AS RELATED TO WHEAT PRODUCTION UNDER UNIRRIGATED CONDITIONS,
W71-01703 03F

CLOGGING
INFLUENCE OF DOMESTIC WASTE WATER PRETREATMENT ON SOIL CLOGGING,
W71-01847 05D

CLOSED CONDUIT FLOW
THE EFFECT OF BED FORMS ON THE HYDRAULIC RESISTANCE,
W71-01931 08B

CLOSED SYSTEMS PLANNING
STORM WATER FOR FUN AND PROFIT,
W71-02150 06B

CLYWEDOG DAM
THE CLYWEDOG RESERVOIR PROJECT,
W71-01738 08A

COACHELLA DISTRIBUTION SYSTEM
SURGE AND AIR ENTRAINMENT IN PIPELINES,
W71-01737 08B

COAL MINE WASTE
COAL AND COAL MINE DRAINAGE (LITERATURE REVIEW),
W71-01768 05D

COAL MINES
NORTH-EAST COAL CO V HAYES (LIABILITY FOR DAMAGES TO FARM BY COAL MINE).
W71-01733 06E

COAL AND COAL MINE DRAINAGE (LITERATURE REVIEW),
W71-01768 05D

COASTAL AQUIFERS
THE SIMULATION OF THE MOVEMENT OF AN INTERFACE BETWEEM SALT AND FRESH WATERS IN A COASTAL AQUIFER BY THE AID OF AN RC ANALOG,
W71-01941 07A

COASTS
COASTAL/ESTUARINE POLLUTION, AN ANNOTATED BIBLIOGRAPHY,
W71-01788 05C

COATED POROUS SUPPORTS
MEMBRANES FOR REVERSE OSMOSIS BY DIRECT CASTING ON POROUS SUPPORTS,
W71-01747 03A

COHO SALMON
INFLUENCE OF DISSOLVED OXYGEN AND CARBON DIOXIDE ON SWIMMING PERFORMANCE OF LARGEMOUTH BASS AND COHO SALMON,
W71-01866 05C

COLD WEATHER CONSTRUCTION
LOW-TEMPERATURE EFFECTS ON THE COMPACTION AND STRENGTH OF A SANDY CLAY,
W71-01727 08D

COLIFORMS
DUCK-PROCESSING WASTE,
W71-01994 05B

TREATMENT OF DUC. WASTES AND THEIR EFFECTS ON WATER QUALITY,
W71-02021 05D

COLLOIDS
FLOCCULATION OF COLLOIDS WITH POLYELECTROLYTES IN AQUEOUS SALT SOLUTIONS,
W71-01901 05D

COLORADO
AREAWIDE SEWERAGE MASTER PLAN REPORT PHASE I - INVENTORY SUMMARY REPORT.
W71-01679 05D

AREAWIDE SEWERAGE MASTER PLAN REPORT FOR THE DENVER METROPOLITAN AREA. PHASE I (INVENTORY).
W71-01687 05D

COMBINED SEWERS
COMBINED SEWER CONSIDERATIONS BY PHILADELPHIA,
W71-02120 05D

COMBUSTION
DESTRUCTION OF CHICKEN MANURE BY INCINERATION,
W71-02020 05D

COMMERCIAL WATERWAY DISTRICTS
A STUDY OF VARIOUS PROCEDURES UTILIZED BY SELECTED WATER-ORIENTED SPECIAL DISTRICTS WHICH ARE COMMON TO ALL OF THEM,
W71-01657 06E

COMMUNITY INFLUENTIALS
COMMUNITY DECISION STRUCTURE AND URBAN PLANNING PROCESS,
W71-02152 06B

COMPACTION
LOW-TEMPERATURE EFFECTS ON THE COMPACTION AND STRENGTH OF A SANDY CLAY,
W71-01727 08D

COMPATIBILITY
TOXICITY OF RHODAMINE B AND FLUOREXCEIN SODIUM TO FISH AND THEIR COMBATABILITY WITH ANTIMYCIN A,
W71-01863 05C

COMPENSATION
VILLAGE OF ORRVILLE V GOCHNAUER (MEASURE OF DAMAGES FOR STREAM POLLUTION).
W71-01691 06E

POINSETT LUMBER AND MFR CO V UNITED STATES (COMPENSATION FOR PHYSICAL INVASION OF PRIVATE PROPERTY BY GOVERNMENT PROJECTS).
W71-02114 06E

LOUISIANA DELTA CATTLE CO V UNITED STATES (LIABILITY FOR PROJECTED DAMAGES FROM PROPOSED IMPROVEMENT).
W71-02118 06E

MATTER OF FORD (COMPENSATION FOR DEPRESSED LAND VALUES WHERE REDUCED WATER SUPPLY UPSET RIVER'S ECOLOGY).
W71-02190 06E

COMPOSITE MEMBRANES
SECOND REPORT ON DEVELOPMENT OF IMPROVED CELLULOSE ACETATE MEMBRANES FOR REVERSE OSMOSIS,
W71-01746 03A

COMPOSITE REVERSE OSMOSIS MEMBRANES
MEMBRANES FOR REVERSE OSMOSIS BY DIRECT CASTING ON POROUS SUPPORTS,
W71-01747 03A

COMPOSTING
ON-SITE COMPOSTING OF POULTRY MANURE,
W71-02013 05D

COMPUTER PROGRAMS
DIGITAL COMPUTER CALCULATION OF UNSTEADY OPEN-CHANNEL FLOW (FRENCH),
W71-01800 08B

DIGITAL SIMULATION IN HYDROLOGY AND ITS ROLE IN HYDROLOGIC EDUCATION,
W71-01820 07C

THE ENCROACHMENT OF THE SALT WATER IN KOITO RIVER MOUTH RESERVOIR,
W71-01942 02L

DIFCOR - A PROGRAM TO SOLVE NONLINEAR EQUATIONS,
W71-02080 06A

OPTIMIZATION BY THE PATTERN SEARCH METHOD,
W71-02081 06A

SYSTEM SIMULATION FOR ANALYSIS AND DESIGN,
W71-02082 06A

COMPUTERS
COMPUTERS IN FLOOD CONTROL PLANNING,
W71-02141 06B

CONCRETE DAMS
SOME RULES USED FOR THE OBSERVATION OF CONCRETE DAMS,
W71-01722 08A

CONCRETE PLACEMENT (SPLIT LEVEL - NO VERTICAL JOINT SCHEME),
W71-01723 08F

CONCRETE PLACING
CONCRETE PLACEMENT (SPLIT LEVEL - NO VERTICAL JOINT SCHEME),
W71-01723 08F

CONCRETE POLYMER COMPOSITIES
DIVISION OF ISOTOPES DEVELOPMENT RESEARCH AND DEVELOPMENT PROJECTS 1969.
W71-01881 05A

CONDUCTIVITY
DISPOSAL OF HOUSEHOLD WASTES IN THE SOIL,
W71-02008 05D

CONDUITS
HOGAN V PENNSYLVANIA RR (ALLEGEDLY INADEQUATE CONDUIT NOT PROXIMATE CAUSE OF FLOODING).
W71-01874 06E

CONFERENCES
GEOMORPHOLOGY,
W71-01830 02J

CONNECTICUT
WATER RESOURCES INVENTORY OF CONNECTICUT - PART 4. SOUTHWESTERN COASTAL RIVER BASINS,
W71-01912 02E

RICHARDSON V TUMBRIDGE (NON-USE OF EASEMENT NOT TANTAMOUNT TO ABANDONMENT).
W71-01928 06E

SOZANSKA V TOWN OF STRATFORD (DRAINAGE OF SURFACE WATER DISCHARGED FROM PUBLIC STREETS).
W71-02094 06E

THOMPSON V WATER RESOURCES COMM'N (JUDICIAL REVIEW OF DREDGING PERMIT).
W71-02191 06E

CONSTITUTIONALITY
JACKVONY V POWEL (PUBLIC PASSAGE BETWEEN HIGH AND LOW WATER MARKS).
W71-02192 06E

CONSTRUCTION
EVALUATION OF SOILS AND PERMAFROST CONDITIONS IN THE TERRITORY OF ALASKA BY MEANS OF AERIAL PHOTOGRAPHS, VOLUME I,
W71-01665 02C

EVALUATION OF SOILS AND PERMAFROST CONDITIONS IN THE TERRITORY OF ALASKA BY MEANS OF AERIAL PHOTOGRAPHS, VOLUME II.
W71-01666 02C

CONSTRUCTION MATERIALS
REPRESENTATION OF NON-GRANULAR BOUNDARIES IN HYDRAULIC MODELS,
W71-01927 08B

SECTION III ALTERNATIVE PLANS.
W71-02158 06A

CONSTRUCTION METHODS
CONCRETE PLACEMENT (SPLIT LEVEL - NO VERTICAL JOINT SCHEME),
W71-01723 08F

TECHNOLOGY OF CONSTRUCTING CANALS WITH POLYMER MEMBRANE LININGS,
W71-01739 08G

CONTINENTAL SHELVES
BOTTOM TOPOGRAPHY AND SEDIMENT TEXTURE NEAR THE COLUMBIA RIVER MOUTH,
W71-01698 02L

CONTRACTS
STRONG V TRUSTEES OF FREEHOLDERS AND COMMONALTY (INTERPRETATION OF DEED CONVEYING UPLANDS AND LOWLANDS).
W71-02046 06E

MARTIN V LOUISIANA PUB UTIL CO (RIGHTS OF PARTIES UNDER WATER CONTRACT).
W71-02174 06E

PIKE RAPIDS POWER CO V SCHWINTEK (SPECIFIC PERFORMANCE OF CONTRACT TO CONVEY FLOWAGE RIGHTS).
W71-02181 06E

BEAVERTON POWER CO V WOLVERINE POWER CO (BREACH OF ORAL CONTRACT TO CONVEY FLOWAGE RIGHTS).
W71-02182 06E

ANDERSON V OTTER TAIL POWER CO (LIABILITY FOR BREACH OF COVENANT TO PROVIDE POWER FROM DAM).
W71-02183 06E

ANGELO V RAILROAD COMM'N (CONSTITUTIONALITY OF CONTRACT TO REMOVE MARL FROM LAKEBED).
W71-02185 06E

CONTROL
CONTROL MECHANISMS OPERATIVE IN A NATURAL MICROBIAL POPULATION SELECTION FOR IT'S ABILITY TO DEGRADE L-LYSINE,
W71-01838 05D

A NEW APPROACH TO CONTROLING BIOLOGICAL PROCESSES,
W71-01854 05D

DIGESTION FUNDAMENTALS APPLIED TO DIGESTER RECOVERY--TWO CASE STUDIES,
W71-01856 05D

CHAPTER IV OPTIMUM INVESTMENT IN WATER POLLUTION CONTROL.
W71-02134 06B

CONVECTION
DIFFUSION OF HORIZONTAL BUOYANT JET DISCHARGED AT WATER SURFACE,
W71-01790 05B

MATHEMATICAL SIMULATION OF TWO-DIMENSIONAL HORIZONTAL CONVECTIVE-DISPERSION IN WELL-MIXED ESTUARIES,
W71-01798 02L

COOLING SYSTEMS
GRAND COULEE 230- AND 115-KV PIPE-TYPE CABLE SYSTEMS,
W71-01743 08C

COOLING TOWERS
SPECIAL REPORT COOLING TOWERS.
W71-02064 05D

COOLING TOWER DESIGN CRITERIA AND WATER TREATMENT,
W71-02073 05D

CONTROL OF COOLING TOWER MIST,
W71-02074 05D

COOLING WATER
HEAT REJECTION REQUIREMENTS OF THE U. S.,
W71-02062 05C

CHANGING EMPHASIS IN THE SITING OF STEAM ELECTRIC POWER STATIONS,
W71-02063 05C

SPECIAL REPORT COOLING TOWERS.
W71-02064 05D

COPPER SULFATE
THE USE OF COPPER SULFATE AS A MEDICAMENT FOR AQUARIUM FISHES AND AS AN ALGAECIDE IN MARINE MAMMAL WATER SYSTEMS,
W71-01868 05C

COPROPHAGY
COPROPHAGY AND USE OF ANIMAL WASTE IN LIVESTOCK FEEDS,
W71-02024 05D

CORN STARCH
FLOCCULATION OF COLLOIDS WITH POLYELECTROLYTES IN AQUEOUS SALT SOLUTIONS,
W71-01901 05D

COST
CHARGES FOR TREATING INDUSTRIAL WASTE WATER IN MUNICIPAL PLANTS,
W71-01851 05D

COST ANALYSIS
ECONOMICS OF LIQUID-MANURE DISPOSAL FROM CONFINED LIVESTOCK,
W71-02029 05D

COSTS
ECONOMIC TRANSPORT OF DIGESTED SLUDGE SLURRIES,
W71-01844 05D

AN ECONOMIC STUDY OF THE EFFECT OF MUNICIPAL SEWER SURCHARGES ON INDUSTRIAL WASTES,
W71-01897 05G

EFFLUENT MANAGEMENT BY JUDICIOUS INTEGRATION OF VARIOUS PROCESSES AND UTILIZATION OF TREATMENT PLANT BEYOND DESIGN CAPACITY,
W71-01985 05D

MANURE MANAGEMENT - COSTS AND PRODUCT FORMS,
W71-02037 05D

SWINE MANURE -- LIABILITY OR ASSET,
W71-02047 05D

SECTION III ALTERNATIVE PLANS.
W71-02158 06A

COST-BENEFIT ANALYSIS
AN ECONOMIC REAPPRAISAL OF THE TOLEDO BEND MULTIPLE-PURPOSE PROJECT,
W71-01652 06B

GUIDELINES FOR ESTABLISHING ECONOMIC AND ENGINEERING FLOOD CRITERIA,
W71-02079 06C

COST-EFFECTIVENESS ANALYSIS OF CIVIL ENGINEERING SYSTEMS

NEW YORK CITY'S PRIMARY,
W71-02083 06B

CHAPTER VIII, MULTIPLE-OBJECTIVE PLANNING, BENEFIT-COST ANALYSIS AND DISCOUNT RATE.
W71-02138 06B

COTTON
SUBSURFACE APPLICATION AND SHALLOW INCORPORATION OF HERBICIDES CN COTTON,
W71-01704 02I

COWTOWNS
PROBLEMS OF CATTLE FEEDING IN ARIZONA AS RELATED TO ANIMAL-WASTE MANAGEMENT,
W71-02027 05D

CROP MANAGEMENT
SUBSURFACE APPLICATION AND SHALLOW INCORPORATION OF HERBICIDES CN COTTON,
W71-01704 02I

THE INFLUENCE OF TILLAGE PRACTICES ON YIELDS AND WEED CONTROL IN SAFFLOWER,
W71-01711 02I

CONTROL OF WILD CANE IN SOYBEANS,
W71-01713 03F

CROP PRODUCTION
SOIL MOISTURE CHARACTERISTICS OF INDIAN GRUMOSOLS AS RELATED TO WHEAT PRODUCTION UNDER UNIRRIGATED CONDITIONS,
W71-01703 03F

SUBSURFACE APPLICATION AND SHALLOW INCORPORATION OF HERBICIDES ON COTTON,
W71-01704 02I

THE INFLUENCE OF TILLAGE PRACTICES ON YIELDS AND WEED CONTROL IN SAFFLOWER,
W71-01711 02I

CROP RESPONSE
CONTROL OF WILD CANE IN SOYBEANS,
W71-01713 03F

CROSSED-BEAM TECHNIQUE
STATISTICAL PROPERTIES OF TURBULENT DENSITY FLUCTUATIONS,
W71-02057 08B

CRUSTACEA
THE CYCLOPID FAUNA OF THE LITTORAL ZONE OF RYBINSK RESERVOIR,
W71-01663 02H

CULTIVATION
THE INFLUENCE OF TILLAGE PRACTICES ON YIELDS AND WEED CONTROL IN SAFFLOWER,
W71-01711 02I

CULVERTS
ELLERSON FLORAL CO V CHESAPEAKE AND O RY (LIABILITY FOR FLOODING CAUSED BY EXTRAORDINARY RAINFALL).
W71-01770 06E

SCRANTON-PASCAGOULA REALTY CO V CITY OF PASCAGOULA (ARTIFICIAL CHANNEL MAY BECOME WATERCOURSE BY PRESCRIPTION).
W71-02173 06E

CURRENTS(WATER)
STUDY OF THE INFLUENCE OF A DAM, BUILT IN A TIDAL ESTUARY, CN ITS TIDAL CHARACTERISTICS,
W71-01797 08B

POLYPHASE CURRENTS WITH NONUNIFORM SEDIMENTS AND THE PHYSICS CF RIVER FLOW,
W71-01929 02J

CYANIDES
REMOVAL OF ORGANIC NITRILES FROM WASTE WATER SYSTEMS,
W71-01840 05D

CYCLOPIDS
THE CYCLOPID FAUNA OF THE LITTORAL ZONE OF RYBINSK RESERVOIR,
W71-01663 02H

CYTOKININS
THE INFLUENCE OF GROUNDWATER SALINITY ON PLANT GROWTH,
W71-01701 02F

DAIRY MANURE
OPERATING CHARACTERISTICS OF TWO AEROBIC-ANAEROBIC DAIRY MANURE TREATMENT SYSTEMS,
W71-02011 05D

DAM CONSTRUCTION
THE CLYWEDOG RESERVOIR PROJECT,
W71-01738 08A

ERICKSON V COUNTY OF STEARNS (LIABILITY OF CCUNTY FOR DAMAGES FROM DAM OPERATION).
W71-02176 06E

DAM DESIGN
THE CLYWEDOG RESERVOIR PROJECT,
W71-01738 08A

DAM FAILURE
WINCHESTER WATER WORKS CO V HOLLIDAY (WATER COMPANY'S LIABILITY FOR DAMAGES RESULTING FROM BUILDING OF A FLASHBOARD DAM).
W71-02131 06E

DAM FOUNDATIONS
DESIGN AND PERFORMANCE OF PROVISIONS FOR FOUNDATION SEEPAGE CONTROL AT GARDINER DAM,
W71-01736 08D

DAMAGES
VILLAGE OF ORRVILLE V GOCHNAUER (MEASURE OF DAMAGES FOR STREAM POLLUTION).
W71-01691 06E

NORTH-EAST COAL CO V HAYES (LIABILITY FOR DAMAGES TO FARM BY COAL MINE).
W71-01733 06E

CHICAGO, ST L AND N O RR V HICKS (RAILROAD'S LIABILITY FOR FLOOD DAMAGE CAUSED BY ERODED EMBANKMENT).
W71-01963 06E

BENNETT V CUPINS (LIABILITY FOR DIVERSION OF SURFACE WATER).
W71-02058 06E

SIMONSON V ALDEN TOWNSHIP (LIABILITY FOR DRAINAGE OF SURFACE WATER).
W71-02077 06E

DAVIS V GARDEN HILLS CORP (PROPER MEASURE OF DAMAGES FOR POLLUTION OF STREAM).
W71-02093 06E

THE GEORGIE (LIABILITY FOR DAMAGE FROM INJURY TO SUBMARINE COMMUNICATIONS CABLE).
W71-02165 06E

PFANNEBECKER V CHICAGO RI AND P RY (LIABILITY FOR DAMAGES RESULTING FROM TWO OR MORE CAUSES).
W71-02180 06E

DAMS
WASHINGTON WATER CO V PARRETT (DAMAGES FROM DAM OVERFLOW).
W71-01811 06E

LINDENMUTH V SAFE HARBOR WATER POWER CORP (EASEMENT FOR FLOODING CAUSED BY DAM CONSTRUCTION).
W71-01924 06E

DE KALB COUNTY V TENN ELEC POWER CO (LIABILITY FOR FLOOD DAMAGE CAUSED BY DAM OVERFLOW DURING UNPRECEDENTED FLOOD).
W71-01965 06E

NIAGARA FALLS POWER CO V WATER POWER AND CONTROL COMM'N (RIGHTS OF STATE IN GRANTED LANDS).
W71-02038 06E

LITTLE FALLS FIBRE CO V HENRY FORD AND SONS (LIABILITY OF LICENSEE FOR MAINTENANCE OF FLASHBOARDS ON FEDERAL DAM).
W71-02159 06E

GULF STATES STEEL CO V LAW (LIABILITY FOR FLOOD DAMAGE BY DAM OWNER).
W71-02166 06E

PIKE RAPIDS POWER CO V SCHWINTEK (SPECIFIC PERFORMANCE OF CONTRACT TO CONVEY FLOWAGE RIGHTS).
W71-02181 06E

BEAVERTON POWER CO V WOLVERINE POWER CO (BREACH OF ORAL CONTRACT TO CONVEY FLOWAGE RIGHTS).
W71-02182 06E

ANDERSON V OTTER TAIL POWER CO (LIABILITY FOR BREACH OF COVENANT TO PROVIDE POWER FROM DAM).
W71-02183 06E

CITY OF BARABOO V RAILROAD COMM'N (JUDICIAL REVIEW OF ADMINISTRATIVE ORDER TO LOWER DAM HEIGHT).
W71-02184 06E

MELANDER V FREEBORN COUNTY (DAMAGES TO LAND AND CROPS AS A RESULT OF DAM CONSTRUCTION).
W71-02188 06E

DAN REGION PROJECT FOR WASTE WATER REUSE
THE OUTLOOK FOR WASTE WATER UTILIZATION IN ISRAEL,
W71-02104 05D

DAN REGIONAL SCHEME
SOFT WATER SUPPLY FOR URBAN CONSUMPTION, A FEASIBILITY STUDY,
W71-02106 05F

DARCYS LAW
RELATIONSHIP BETWEEN VELOCITY OF SEEPAGE AND HYDRAULIC GRADIENT IN THE ZONE OF HIGH VELOCITY,
W71-01947 08B

THE LINEAR AND NON-LINEAR REGIMES OF THE FILTRATION LAW AND THEIR CONSEQUENCES IN GEOHYDRAULIC PROBLEMS,
W71-01948 02F

SEEPAGE LAW FOR MICROSEEPAGE,
W71-01950 04A

DARCY'S LAW
GENERAL CHARACTERIZATION OF DIFFERENT TYPES OF SEEPAGE,
W71-01935 04A

DATA COLLECTIONS
SATELLITE (ERTS-A) NETWORK OF GROUND DATA SENSORS A USER-

CRIENTED EXPERIMENT,
W71-01772 07A

DEAERATION
DECARBONATION AND DEAERATION OF WATER BY USE OF SELECTIVE HOLLOW FIBERS,
W71-01756 05D

DECARBONATION
DECARBONATION AND DEAERATION OF WATER BY USE OF SELECTIVE HOLLOW FIBERS,
W71-01756 05D

DECISION MAKING
CHAPTER VII POLITICAL AND INSTITUTIONAL ASPECTS OF THE EVALUATION OF WATER RESOURCE PROGRAMS.
W71-02137 06B

COMMUNITY DECISION STRUCTURE AND URBAN PLANNING PROCESS,
W71-02152 06B

DEEP-BED FILTERS
DEEP-BED FILTER SYSTEM FOR MILL SCALE REMOVAL,
W71-01971 05D

DEGRADATICN(DECOMPOSITION)
KINETICS OF THE MICROBIAL DECOMPOSITION OF THE HERBICIDES IPC AND CIPC,
W71-01855 05D

DEGRADATION(STREAM)
VARIATION OF ROUGHNESS DURING DEGRADATION,
W71-01786 08B

DELAWARE ESTUARY
MATHEMATICAL PROGRAMMING FOR REGIONAL WATER QUALITY MANAGEMENT,
W71-01659 05G

DENSITY FLUCTUATIONS
STATISTICAL PROPERTIES OF TURBULENT DENSITY FLUCTUATIONS,
W71-02057 08B

DENSITY GRADIENT
A THEORY OF TURBULENCE IN STRATIFIED FLUIDS,
W71-02056 08B

STATISTICAL PROPERTIES OF TURBULENT DENSITY FLUCTUATIONS,
W71-02057 08B

DENSITY STRATIFICATION
THE PREDICTION OF WITHDRAWAL LAYER THICKNESS IN DENSITY STRATIFIED RESERVOIRS,
W71-01954 02H

THE ANALYSIS OF THE FLOW OF LAYERED FLUIDS,
W71-01959 02L

EFFLUENT FROM A SLOT INTO STAGNANT OR MOVING AMBIENT FLUID CF GREATER DENSITY,
W71-01961 05G

A THEORY OF TURBULENCE IN STRATIFIED FLUIDS,

THE STABILITY OF STRATIFIED SHEAR FLOWS,
W71-02061 08B

DESALINATION
SECOND REPORT ON DEVELOPMENT OF IMPROVED CELLULOSE ACETATE MEMBRANES FOR REVERSE OSMOSIS,
W71-01746 03A

MEMBRANES FOR REVERSE OSMOSIS BY DIRECT CASTING ON POROUS SUPPORTS,
W71-01747 03A

'INVESTIGATION OF MULTISTAGE FLASH PHENOMEAN IN A THREE-STAGE TEST SYSTEM',
W71-01749 03A

EXPERIMENTAL DESALINATION TEST CELL AND MEANS FOR MEASURING THE CONCENTRATICN POLARIZATION BOUNDARY LAYER IN A REVERSE OSMOSIS SYSTEM,
W71-01752 03A

ANNUAL REPORT (FY 1968) WEBSTER TEST FACILITY AND ELECTRODIALYSIS TEST-BED PLANT, WEBSTER, SOUTH DAKOTA.
W71-01754 03A

1969-1970 SALINE WATER CONVERSION REPORT.
W71-01755 03A

SALINE GROUND-WATER RESOURCES OF THE TULAROSA BASIN, NEW MEXICO,
W71-01870 03C

NUCLEAR DESALINATION PROGRAM ANNUAL PROGRESS REPORT ON ACTIVITIES SPONSORED BY THE ATOMIC ENERGY COMMISSION FOR PERIOD ENDING OCTOBER 31, 1969,
W71-01882 03A

DESIGN
PERFORMANCE OF DEEP TRICKLING FILTERS BY FIVE METHODS,
W71-01841 05D

SEPTIC TANK SYSTEMS,
W71-01842 05D

OPTIMUM WASTE TREATMENT PLANT DESIGN UNDER UNCERTAINTY,
W71-01845 05D

TREATMENT PLANT DESIGNED FOR FROZEN MEAT WASTES,
W71-01973 05D

LIBERTY, S.C. TEXTILE FINISHING WASTE,
W71-01978 05D

CONSIDERATIONS ON THE DESIGN OF A SEWAGE PURIFICATION PLANT TO PRODUCE AN EFFLUENT SUITABLE FOR ADVANCED PURIFICATION,
W71-01984 05D

EFFLUENT MANAGEMENT BY JUDICIOUS INTEGRATION OF VARIOUS PROCESSES AND UTILIZATION OF TREATMENT PLANT BEYOND DESIGN CAPACITY,
W71-01985 05D

DESIGN OF A HYDROLOGIC CONDITION SURVEY USING FACTOR ANALYSIS.
W71-02085 04D

DESIGN CRITERIA
PRIMARY TREATMENT OF SWINE WASTES BY LAGOONING,
W71-02014 05D

COOLING TOWER DESIGN CRITERIA AND WATER TREATMENT,
W71-02073 05D

DESIGN FLOW
EXPERIMENTAL STUDIES OF FLOWS WITH HIGH SOLID PARTICLE CONCENTRATIONS,
W71-01920 08B

DESIGN STORM
HYDROMETEOROLOGICAL STUDIES,
W71-01819 02B

DETECTION METHODS
INFILTRATION IN SEPARATE SANITARY SEWERS,
W71-01852 05D

DETENTION RESERVOIRS
STORMWATER RUNOFF FROM CATTLE FEEDLOTS,
W71-01997 05B

DETERGENTS
STUDIES ON THE ACTION OF HIGH CONCENTRATIONS OF ALKYLPOLYGLCYCOL ETHERS ON FISH (GERMAN),
W71-01860 05C

DEVICES
CHAPTER II PREPARATION OF REGIONAL, BASIN AND STATE PLANS,
W71-02122 06B

DEWATERING
DEWATERING CHICKEN MANURES BY VACUUM FILTRATION,
W71-02017 05D

REMOVAL OF MOISTURE FROM POULTRY WASTE BY ELECTRO-OSMOSIS (PART I),
W71-02018 05D

REMOVAL OF MOISTURE FROM POULTRY WASTE BY ELECTRO-OSMOSIS (PART 2),
W71-02019 05D

DIAZINON
MICROBIAL DEGRADATION OF ORGANIC POLLUTANTS OF INDUSTRIAL ORIGIN,
W71-01898 05C

DICAMBA
LOSS OF HERBICIDES IN RUNOFF WATER,
W71-01716 05B

DIELDRIN
DEMONSTRATION OF TOXIC SUBSTANCES BY USING THE FISH, LEBISTES RETICULATUS (DUTCH),
W71-01859 05C

DIFFUSION
DISCUSSION OF DISPERSIVITY TENSOR FOR TURBULENT UNIFORM CHANNEL FLOW,
W71-02068 08B

DIGESTED SLUDGE
ECONOMIC TRANSPORT OF DIGESTED SLUDGE SLURRIES,
W71-01844 05D

DIGESTION
DIGESTION FUNDAMENTALS APPLIED TO DIGESTER RECOVERY--TWO CASE STUDIES,
W71-01856 05D

DIGESTION COEFFICIENTS
UTILIZATION OF ANIMAL WASTE AS FEED FOR RUMINANTS,
W71-02023 05D

DIGITAL COMPUTERS
A STEADY STATE OPTIMAL DESIGN OF ARTIFICIAL INDUCED AERATION IN POLLUTED STREAMS BY THE USE OF PONTRYAGIN'S MINIMUM PRINCIPLE,
W71-02095 05G

DIGITAL SIMULATION
A PRELIMINARY EVALUATION OF THE THERMAL EFFECTS OF THE BEN FRANKLIN DAM PROJECT ON COLUMBIA RIVER TEMPERATURES BELOW THE HANFORD PLANT,
W71-02076 05C

DIKE
LAKE MICHIGAN DEVELOPMENT PROPOSAL.

W71-02156 05G

SECTION II WATER QUALITY AND HYDRAULICS.
W71-02157 06A

SECTION III ALTERNATIVE PLANS.

SURVEY TO DETERMINE QUANTITIES AND PROPERTIES OF SEWAGE FROM NAVAL VESSELS,
W71-01690 05B

APPLICATION OF IONIZING RADIATION TO THE TREATMENT OF WASTE WATERS AND SEWAGE SLUDGE,
W71-01695 05D

A MASTER PLAN REPORT FOR THE ATLANTIC COUNTY NEW JERSEY PLANNING BOARD, WATER AND SEWER STUDIES.
W71-01875 05D

SECTION II WATER QUALITY AND HYDRAULICS.
W71-02157 06A

SEWAGE BACTERIA
REQUIREMENTS FOR MICROBIAL REDUCTION OF FARM ANIMAL WASTES,
W71-02009 05D

SEWAGE DISPOSAL
SEPTIC TANK SYSTEMS,
W71-01842 05D

ENGINEERING PROBLEMS IN YEAR-ROUND DISTRIBUTION OF WASTE WATER,
W71-02001 05E

DISPOSAL OF HOUSEHOLD WASTES IN THE SOIL,
W71-02008 05D

SEWAGE DISTRICTS
A STUDY OF VARIOUS PROCEDURES UTILIZED BY SELECTED WATER-ORIENTED SPECIAL DISTRICTS WHICH ARE COMMON TO ALL OF THEM,
W71-01657 06E

SEWAGE TREATMENT
APPLICATION OF IONIZING RADIATION TO THE TREATMENT OF WASTE WATERS AND SEWAGE SLUDGE,
W71-01695 05D

WASTE TREATMENT BY AEROBIC TECHNIQUES,
W71-01765 05D

POTOMAC RIVER WATER QUALITY, WASHINGTON, D.C. METROPOLITAN AREA.
W71-01817 05B

OPTIMUM WASTE TREATMENT PLANT DESIGN UNDER UNCERTAINTY,
W71-01845 05D

INFLUENCE OF DOMESTIC WASTE WATER PRETREATMENT ON SOIL CLOGGING,
W71-01847 05D

CHARGES FOR TREATING INDUSTRIAL WASTE WATER IN MUNICIPAL PLANTS,
W71-01851 05D

DEVELOPMENT OF A FLUIDIZED-BED TECHNIQUE FOR THE REGENERATION OF POWDERED ACTIVATED CARBON,
W71-01858 05D

A STUDY OF MEAT PACKING AND RENDERING WASTES,
W71-01975 05D

CONSIDERATIONS ON THE DESIGN OF A SEWAGE PURIFICATION PLANT TO PRODUCE AN EFFLUENT SUITABLE FOR ADVANCED PURIFICATION,
W71-01984 05D

SEWER SURCHARGES
AN ECONOMIC STUDY OF THE EFFECT OF MUNICIPAL SEWER SURCHARGES ON INDUSTRIAL WASTES,
W71-01897 05G

SEWERAGE
WASTE WATER AND STORM FLOW TREATMENT (LITERATURE REVIEW),
W71-01769 05D

SEWERS
PLAN FOR PUBLIC SEWERAGE FACILITY DEVELOPMENT.
W71-01700 05D

WASTE WATER AND STORM FLOW TREATMENT (LITERATURE REVIEW),
W71-01769 05D

INFILTRATION IN SEPARATE SANITARY SEWERS,
W71-01852 05D

COMBINED SEWER CONSIDERATIONS BY PHILADELPHIA,
W71-02120 05D

SHEAR FLOW
THE STABILITY OF STRATIFIED SHEAR FLOWS,
W71-02061 08B

SHEEP
VALUE OF BROILER LITTER AS FEED FOR RUMINANTS,
W71-02022 05D

SHELTER

MICROMETEOROLOGICAL INVESTIGATIONS OF THE ENERGY BUDGET EFFECT OF SUMMER WINDS,
W71-01889 02D

SHIPS
RELATIVE EFFECT OF WAVES GENERATED BY LARGE SHIPS AND SMALL BOATS IN RESTRICTED WATERWAYS,
W71-01664 08B

SURVEY TO DETERMINE QUANTITIES AND PROPERTIES OF SEWAGE FROM NAVAL VESSELS,
W71-01690 05B

CORBY V RAMSDELL (OBSTRUCTION TO NAVIGATION AS PUBLIC NUISANCE).
W71-02160 06E

AKTIESELSKABET DAMPSKIB GANSFJORD V UNITED STATES (SHIP MAY BE SUBJECT TO LIBEL IN COURT OF LAW FOR DAMAGE TO LAND OBJECT).
W71-02162 06E

THE GANSFJORD (SHIP SUBJECT TO LIBEL FOR DAMAGING JETTY).
W71-02164 06E

FLORIDA EAST COAST RY V ACHESON (LIABILITY FOR OBSTRUCTION TO NAVIGATION).
W71-02171 06E

SHORES
ON THE SHORELINE AND LEADING FRONT CONDITIONS OF TSUNAMI WAVES IN THE LIGHT OF THE METHOD OF CHARACTERISTICS,
W71-01940 02E

SHOTCRETE
PRESTRESSED ROCK ANCHORS AND SHOTCRETE FOR LARGE UNDERGROUND POWERHOUSE,
W71-01735 08C

SIEROZEMS
EOLIAN SEDIMENT INFLUENCE ON PEDOGENESIS DURING THE QUATERNARY,
W71-01709 02G

SIERRA LEONE
THE VEGETATION OF SUPERFICIAL IRONSTONE HARDPANS IN SIERRA LEONE,
W71-01710 02G

SILICA
WATER QUALITY CONTROL WITH SYNTHETIC POLYMERIC FLOCCULANTS,
W71-01899 05D

SILICA SOLUBILITY
ALKALINITY AND FORMATION OF ZEOLITES IN SALINE ALKALINE LAKES,
W71-01903 02H

SILTING
DEEPENING THE APPROACH CHANNEL TO THE PORT OF COCHIN, INDIA,
W71-01792 08B

HYDROGRAPHIC CHANGES IN THE EDINBURGH CHANNELS, OUTER THAMES ESTUARY, U.K.,
W71-01796 02L

SILVER MICROPROBES
EXPERIMENTAL DESALINATION TEST CELL AND MEANS FOR MEASURING THE CONCENTRATION POLARIZATION BOUNDARY LAYER IN A REVERSE OSMOSIS SYSTEM,
W71-01752 03A

SIMULATION ANALYSIS
SIMULATION OF RIVER BED VARIATION IN MOUNTAINOUS BASIN,
W71-01782 02A

SIMULATION OF FLOOD PROPAGATION BY DIGITAL COMPUTER AND ITS APPLICATION TO RIVER PROBLEM,
W71-01802 08B

SIMULATION OF THE BAVARIAN REACH OF THE DANUBE RIVER,
W71-01806 08B

DIGITAL SIMULATION IN HYDROLOGY AND ITS ROLE IN HYDROLOGIC EDUCATION,
W71-01820 07C

SYSTEM SIMULATION FOR ANALYSIS AND DESIGN,
W71-02082 06A

SIMULATION GAMING
CHAPTER IV OPTIMUM INVESTMENT IN WATER POLLUTION CONTROL.
W71-02134 06B

SKIDDING
DETRIMENTAL EFFECTS OF NATURAL SOIL AND WATER ELEMENTS ON DRAINAGE PIPE STRUCTURES IN ALABAMA,
W71-01676 08B

SLATTED FLOOR
SLOPING FLOORS FOR BEEF-CATTLE FEEDLOTS,
W71-02002 05D

SLAUGHTERHOUSE WASTE TREATMENT
MEAT AND POULTRY PROCESSING WASTES (LITERATURE REVIEW),
W71-01761 05D

SLOPING FLOOR
SLOPING FLOORS FOR BEEF-CATTLE FEEDLOTS,
W71-02002 05D

SLUDGE
ECONOMIC TRANSPORT OF DIGESTED SLUDGE SLURRIES,
W71-01844 05D

SLUDGE ACCUMULATION
PRIMARY TREATMENT OF SWINE WASTES BY LAGOONING,
W71-02014 05D

SLUDGE CONDITIONERS
DEWATERING CHICKEN MANURES BY VACUUM FILTRATION,
W71-02017 05D

SLUDGE DISPOSAL
ECONOMIC TRANSPORT OF DIGESTED SLUDGE SLURRIES,
W71-01844 05D

SLUDGE TREATMENT
DEWATERING CHICKEN MANURES BY VACUUM FILTRATION,
W71-02017 05D

SLURRIES
MANAGEMENT OF FARM ANIMAL WASTES.
W71-01992 05D

PUMPING MANURE SLURRIES,
W71-02000 05E

SMALL WATERSHEDS
AN ENGINEERING-ORIENTED MODEL OF WATERSHED HYDROLOGY,
W71-01821 02A

SNOW
SNOW AND ICE HYDROLOGY,
W71-01826 02C

SNOWPACKS
GLACIERS AND SNOWPACKS SOME COMMON PROBLEMS IN NON-POLAR GLACIOLOGY,
W71-01827 02C

SOCIAL ASPECTS
ECONOMICS AND ECOSYSTEMS,
W71-01750 06A

BASIC CONTEMPORARY URBAN PROBLEMS,
W71-02144 06B

SODIC CONDITIONS
DIAGNOSIS OF SODIC CONDITIONS IN SALINE-ALKALI SOILS OF WESTERN RAJASTHAN,
W71-01706 02G

SODIUM
DIAGNOSIS OF SODIC CONDITIONS IN SALINE-ALKALI SOILS OF WESTERN RAJASTHAN,
W71-01706 02G

THERMODYNAMIC EQUILIBRIUM CONSTANTS OF SODIUM-CALCIUM EXCHANGE IN SOME ISRAEL SOILS,
W71-01717 02G

SODIUM ADSORPTION RATIO(SAR)
DIAGNOSIS OF SODIC CONDITIONS IN SALINE-ALKALI SOILS OF WESTERN RAJASTHAN,
W71-01706 02G

SODIUM HALIDES
INTERACTING EFFECTS OF GAMMA RADIATION AND SODIUM HALIDE CONCENTRATIONS ON RAINBOW TROUT,
W71-01865 05C

SODIUM-CALCIUM EXCHANGE
THERMODYNAMIC EQUILIBRIUM CONSTANTS OF SODIUM-CALCIUM EXCHANGE IN SOME ISRAEL SOILS,
W71-01717 02G

SOIL ABSORPTION
DISPOSAL OF HOUSEHOLD WASTES IN THE SOIL,
W71-02008 05D

SOIL AGGREGATES
STABILIZATION OF SHEAR-GENERATED SOIL AGGREGATES,
W71-01771 02G

SOIL ASSOCIATION
LAND CLASSIFICATION FOR IRRIGATION, CURRY COUNTY,
W71-01654 03F

SOIL ASSOCIATIONS
SOIL ASSOCIATIONS AND LAND CLASSIFICATION FOR IRRIGATION, SAN JUAN COUNTY,
W71-01653 03F

SOIL CHEMISTRY
EOLIAN SEDIMENT INFLUENCE ON PEDOGENESIS DURING THE QUATERNARY,
W71-01709 02G

THERMODYNAMIC EQUILIBRIUM CONSTANTS OF SODIUM-CALCIUM EXCHANGE IN SOME ISRAEL SOILS,
W71-01717 02G

KINETICS AND ENERGETICS OF ADSORPTION AND DESORPTION OF MINERAL NUTRIENTS FROM SOIL MINERALS,
W71-01991 02G

SOIL CLASSIFICATION
SOIL ASSOCIATIONS AND LAND CLASSIFICATION FOR IRRIGATION, SAN JUAN COUNTY,
W71-01653 03F

LAND CLASSIFICATION FOR IRRIGATION, CURRY COUNTY,
W71-01654 03F

OIL CLOGGING
DISPOSAL OF HOUSEHOLD WASTES IN THE SOIL,
W71-02008 05D

OIL CONTAMINATION
SEEPAGE OF FEEDYARD RUNOFF WATER IMPOUNDED IN PLAYAS,
W71-01705 05A

FERTILIZERS AND FEEDLOTS --- WHAT ROLE IN GROUNDWATER POLLUTION.
W71-02036 05B

OIL DEPTH
ECOLOGICAL STUDIES ON THE GRASSLANDS OF JHANSI, U.P.,
W71-01707 03F

OIL GASES
EOLIAN SEDIMENT INFLUENCE ON PEDOGENESIS DURING THE QUATERNARY,
W71-01709 02G

OIL MATRIC SUCTIONS
THE EFFECTS OF FARMYARD MANURE ON MATRIC SUCTIONS PREVAILING IN A SANDY LOAM SOIL,
W71-02034 05D

OIL MECHANICS
CONTINUED EVALUATION OF ROADSIDE DEVELOPMENT AND EROSION CONTROL EXPERIMENTS. PART I. CAUSES AND CONTROL OF SOIL EROSION ON OKLAHOMA HIGHWAYS. PART II. MAINTENANCE OF VEGETATIVE GROUND COVERS ON OKLAHOMA HIGHWAYS. PART III. WEED CONTROL AND ERADICATION ON OKLAHOMA HIGHWAYS,
W71-01681 04C

SOIL MOISTURE
PART I, CONTROLLING THE SOIL MOISTURE ENVIRONMENT OF TRANSPIRING PLANTS, PART II, PREDICTION OF LEAF TEMPERATURE UNDER NATURAL ATMOSPHERIC CONDITIONS,
W71-01660 02I

SOIL MOISTURE CHARACTERISTICS OF INDIAN GRUMOSOLS AS RELATED TO WHEAT PRODUCTION UNDER UNIRRIGATED CONDITIONS,
W71-01703 03F

THE EFFECTS OF FARMYARD MANURE ON MATRIC SUCTIONS PREVAILING IN A SANDY LOAM SOIL,
W71-02034 05D

SOIL PHYSICAL PROPERTIES
SOIL MOISTURE CHARACTERISTICS OF INDIAN GRUMOSOLS AS RELATED TO WHEAT PRODUCTION UNDER UNIRRIGATED CONDITIONS,
W71-01703 03F

ECOLOGICAL STUDIES ON THE GRASSLANDS OF JHANSI, U.P.,
W71-01707 03F

SOIL STRUCTURE
STABILIZATION OF SHEAR-GENERATED SOIL AGGREGATES,
W71-01771 02G

SOIL SURFACES
ADVANCE OF IRRIGATION WATER ON THE SOIL SURFACE IN RELATION TO SOIL INFILTRATION RATE A MATHEMATICAL AND LABORATORY MODEL STUDY,
W71-01964 02G

SOIL WATER MOVEMENT
ADVANCE OF IRRIGATION WATER ON THE SOIL SURFACE IN RELATION TO SOIL INFILTRATION RATE A MATHEMATICAL AND LABORATORY MODEL STUDY,
W71-01964 02G

SOILS
EVALUATION OF SOILS AND PERMAFROST CONDITIONS IN THE TERRITORY OF ALASKA BY MEANS OF AERIAL PHOTOGRAPHS, VOLUME I,
W71-01665 02C

EVALUATION OF SOILS AND PERMAFROST CONDITIONS IN THE TERRITORY OF ALASKA BY MEANS OF AERIAL PHOTOGRAPHS, VOLUME II.
W71-01666 02C

SOIL - CROP - TILLAGE INTERACTIONS IN DRYLAND AND IRRIGATED FARMING,
W71-01680 03F

INFLUENCE OF DOMESTIC WASTE WATER PRETREATMENT ON SOIL CLOGGING,
W71-01847 05D

KINETICS AND ENERGETICS OF ADSORPTION AND DESORPTION OF MINERAL NUTRIENTS FROM SOIL MINERALS,
W71-01991 02G

THE EFFECTS OF FARMYARD MANURE ON MATRIC SUCTIONS PREVAILING IN A SANDY LOAM SOIL,
W71-02034 05D

SOIL-WATER MOVEMENT
THE MOVEMENT OF WATER IN UNSATURATED SOILS,
W71-01833 02G

SOIL-WATER RELATIONS
THERMODYNAMIC EQUILIBRIUM CONSTANTS OF SODIUM-CALCIUM EXCHANGE IN SOME ISRAEL SOILS,
W71-01717 02G

SOIL-WATER-PLANT RELATIONSHIPS
ECOLOGICAL STUDIES ON THE GRASSLANDS OF JHANSI, U.P.,
W71-01707 03F

CAN THERE BE A POSITIVE WATER POTENTIAL IN PLANTS,
W71-01718 02I

SOLAR RADIATION
MICROCLIMATE BEFORE AND AFTER IRRIGATION,
W71-01720 02I

SOLID FUELS
DESTRUCTION OF CHICKEN MANURE BY INCINERATION,
W71-02020 05D

SOLIDS RETENTION TIME
ANAEROBIC TREATMENT OF WASTES,
W71-01758 05D

SOUTH AFRICA
CURRENT STATUS OF RESEARCH ON WASTE WATER RECLAMATION IN SOUTH AFRICA,

STORM WATER FOR FUN AND PROFIT,
W71-02150 06B

LAKE MICHIGAN DEVELOPMENT PROPOSAL.
W71-02156 05G

CITY OF SHREVEPORT V WILKINSON (CONSTITUTIONALITY OF ORDINANCE DENYING ACCESS TO LANDOWNER'S HOME).
W71-02169 06E

MATTER OF FORD (COMPENSATION FOR DEPRESSED LAND VALUES WHERE REDUCED WATER SUPPLY UPSET RIVER'S ECOLOGY).
W71-02190 06E

HOLYOKE WATER POWER CO V WHITING AND CO (UNAUTHORIZED USE OF WATER SUPPLY).
W71-02193 06E

WATER UTILIZATION
HAMMOND V ANTWERP LIGHT AND POWER CO (LIMITATIONS ON PRESCRIPTIVE RIGHT TO DIVERT STREAM FLOW).
W71-01693 06E

HOLYOKE WATER POWER CO V WHITING AND CO (UNAUTHORIZED USE OF WATER SUPPLY).
W71-02193 06E

WATER WAVES
RELATIVE EFFECT OF WAVES GENERATED BY LARGE SHIPS AND SMALL BOATS IN RESTRICTED WATERWAYS,
W71-01664 08B

WATER WELLS
HYDROGEOLOGIC DATA FOR THE LOWER THAMES AND SOUTHEASTERN COASTAL RIVER BASINS, CONNECTICUT,
W71-01816 02F

QUANTITY OF WATER FLOWING INTO CIRCULAR INFILTRATION GALLERY,
W71-01933 02G

WATER YIELD
CALIBRATION ANALYSIS OF THE THREE LEADING RIDGE EXPERIMENTAL WATERSHEDS,
W71-01918 02E

WATERCOURSES(LEGAL)
SCRANTON-PASCAGOULA REALTY CO V CITY OF PASCAGOULA (ARTIFICIAL CHANNEL MAY BECOME WATERCOURSE BY PRESCRIPTION).
W71-02173 06E

YASKILL V THIBAULT (LIABILITY OF LOWER RIPARIAN OWNER FOR BLOCKING STREAM).
W71-02199 06E

WATERSHED MANAGEMENT
AN EVALUATION OF STREAMFLOW TIMING FROM SMALL WATERSHED IN NORTHEASTERN UNITED STATES,
W71-01917 02E

CALIBRATION ANALYSIS OF THE THREE LEADING RIDGE EXPERIMENTAL WATERSHEDS,
W71-01918 02E

WATERSHED PROTECT
HEARINGS AND REPORT ON AMENDMENT TO THE WATERSHED AND FLOOD PREVENTION ACT BEFORE THE SUBCOMMITTEE ON CONSERVATION AND CREDIT, COMMITTEE ON AGRICULTURE, US HOUSE OF REPRESENTATIVES, 88TH CONG, 2ND SESSION.
W71-01751 06E

WATERSHEDS
A MULTIVARIATE STATISTICAL MODEL FOR ESTIMATING THE NUMBERS, SIZES,AND INTERFLUVIAL DISTANCES OF STREAMS WITHIN A RELATIVELY HOMOGENEOUS DRAINAGE AREA.
W71-01662 02E

WATER-ORIENTED SPECIAL DISTRICTS
A STUDY OF VARIOUS PROCEDURES UTILIZED BY SELECTED WATER-ORIENTED SPECIAL DISTRICTS WHICH ARE COMMON TO ALL OF THEM,
W71-01657 06E

WAVE EQUATION
THE STABILITY OF STRATIFIED SHEAR FLOWS,
W71-02061 08B

WAVES(WATER)
DIGITAL COMPUTER CALCULATION OF UNSTEADY OPEN-CHANNEL FLOW (FRENCH),
W71-01800 08B

WAVY CHANNEL BED
THEORETICAL DESCRIPTION OF FREE SURFACE TWO-PHASE FLOW OVER A WAVY BED,
W71-01962 08B

WEED CONTROL
SUBSURFACE APPLICATION AND SHALLOW INCORPORATION OF HERBICIDES ON COTTON,
W71-01704 02I

THE INFLUENCE OF TILLAGE PRACTICES ON YIELDS AND WEED CONTROL IN SAFFLOWER,
W71-01711 02I

CONTROL OF WILD CANE IN SOYBEANS,
W71-01713 03F

WESTERN WHORLED MILKWEED AND ITS CONTROL,

TORONTO UNIV. (ONTARIO). DEPT. OF CIVIL ENGINEERING.
INFLUENCE OF DOMESTIC WASTE WATER PRETREATMENT ON SOIL CLOGGING,
W71-01847 05D

TRIANGLE E BY-PRODUCTS CO., HARRISONBURG, VA.
ROLE OF THE RENDERER IN THE USE AND DISPOSAL OF ANIMAL WASTES,
W71-02025 05D

TRW SYSTEMS GROUP, REDONDO BEACH, CALIF.
A METHODOLOGY FOR FLOOD PLAIN DEVELOPMENT AND MANAGEMENT.
W71-01872 06F

TUFTS UNIV., MEDFORD, MASS.
PAPER AND ALLIED PRODUCTS (LITERATURE REVIEW),
W71-01839 05D

UNIVERSIDAD CENTRAL DE VENEZUELA, CARACAS. DEPT. OF ENGINEERING.
MECHANICS OF TURBULENT FLOW IN SEDIMENT-LADEN STREAMS,
W71-01923 02J

UNIVERSIDAD CENTRAL DE VENEZUELA, CARACAS. HYDRAULICS LAB.
THEORETICAL DESCRIPTION OF FREE SURFACE TWO-PHASE FLOW OVER A WAVY BED,
W71-01962 08B

UTAH AGRICULTURAL EXPERIMENT STATION, LOGAN.
KINETICS AND ENERGETICS OF ADSORPTION AND DESORPTION OF MINERAL NUTRIENTS FROM SOIL MINERALS,
W71-01991 02G

UTAH STATE UNIV., LOGAN. CENTER OF ECOLOGY.
INTERACTING EFFECTS OF GAMMA RADIATION AND SODIUM HALIDE CONCENTRATIONS ON RAINBOW TROUT,
W71-01865 05C

UTAH WATER RESEARCH LAB., LOGAN.
SUBCRITICAL FLOW AT OPEN CHANNEL STRUCTURES - OPEN CHANNEL EXPANSIONS,
W71-01836 08B

UTRECHT RIJKSUNIVERSITEIT (NETHERLANDS).
DEMONSTRATION OF TOXIC SUBSTANCES BY USING THE FISH, LEBISTES RETICULATUS (DUTCH),
W71-01859 05C

VANDERBILT UNIV., NASHVILLE, TENN. DEPT. OF ENVIRONMENTAL AND WATER RESOURCES ENGINEERING.
REMOVAL OF ORGANIC NITRILES FROM WASTE WATER SYSTEMS,
W71-01840 05D

VIRGINIA POLYTECHNIC INST., BLACKSBURG CORNELL UNIV., ITHACA, N.Y. AND KANSAS STATE UNIV., MANHATTAN.
VALUE OF BROILER LITTER AS FEED FOR RUMINANTS,
W71-02022 05D

VIRGINIA POLYTECHNIC INST., BLACKSBURG. WATER RESOURCES RESEARCH CENTER.
AMORTIZATION OF NONCONFORMING USES IN FLOOD PLAINS,
W71-02151 06F

VIRGINIA STATE WATER CONTROL BOARD, RICHMOND.
TREATMENT OF DUC. WASTES AND THEIR EFFECTS ON WATER QUALITY,
W71-02021 05D

VOLLMER ASSOCIATES, NEW YORK.
URBAN PLANNING AND DEVELOPMENT OF RIVER CITIES,
W71-02153 06B

WASHINGTON STATE UNIV., PULLMAN. DEPT. OF AGRICULTURAL ENGINEERING.
CATTLE-MANURE HANDLING AND DISPOSAL SYSTEMS ON THE WEST COAST,
W71-02004 05E

WASHINGTON UNIV., SEATTLE AND WASHINGTON STATE UNIV., PULLMAN.
GUIDELINES FOR ESTABLISHING ECONOMIC AND ENGINEERING FLOOD CRITERIA,
W71-02079 06C

WASHINGTON UNIV., SEATTLE. COLL. OF FOREST RESOURCES.
MICROCLIMATE BEFORE AND AFTER IRRIGATION,
W71-01720 02I

WASHINGTON UNIV., SEATTLE. DEPT. OF OCEANOGRAPHY.
BOTTOM TOPOGRAPHY AND SEDIMENT TEXTURE NEAR THE COLUMBIA RIVER MOUTH,

W71-01698 02L

ASHINGTON UNIV., SEATTLE. FISHERIES RESEARCH INST.
STOCK ASSESSMENT BY ECHO INTEGRATION AND ITS APPLICATION TO JUVENILE SOCKEYE SALMON IN LAKE WASHINGTON,
W71-01678 02H

ASHINGTON UNIV., SEATTLE. SCHOOL OF LAW.
A STUDY OF VARIOUS PROCEDURES UTILIZED BY SELECTED WATER-ORIENTED SPECIAL DISTRICTS WHICH ARE COMMON TO ALL OF THEM,
W71-01657 06E

ATER POLIUTICN CONTROL FEDERATION, WASHINGTON, D.C.
GOOD MANAGEMENT INCLUDES EFFECTIVE SAFETY PROGRAMS,
W71-01850 05D

THERMAL POLLUTION-BIOLOGICAL EFFECTS, A REVIEW OF THE LITERATURE OF 1969,
W71-02055 05C

ATER RESOURCES ENGINEERS, INC., WALNUT CREEK, CALIF.
CONCEPTS AND UTILITIES OF ECOLOGIC MODEL,
W71-02115 06G

ATERLOOPKINDIG LABORATORIUM, DELFT (NETHERLANDS).
FLUME STUDY ON SALINITY INTRUSION IN ESTUARIES,
W71-01799 02L

AYNE STATE UNIV., DETROIT, MICH.
A STUDY OF MEAT PACKING AND RENDERING WASTES,
W71-01975 05D

EATHER BUREAU, SILVER SPRING, MD. OFFICE OF HYDROLOGY.
HYDROMETEORCLOGICAL STUDIES,
W71-01819 02B

EST TEXAS UTILITIES CO., ABILENE.
COMPARISON CF DIFFERENT TYPE COOLING TOWERS FOR GAS TURBINE INLET AIR SERVICE,
W71-02069 05G

ESTINGHOUSE ELECTRIC CORP., EAST PITTSBURGH, PA.
COMPUTER CONTROLS AND MEASUREMENTS WALTZ MILL 1100 KV UNDERGROUND TRANSMISSION TEST FACILITY,
W71-01728 08C

WISCONSIN UNIV., MADISON.
STREAM ENRICHMENT FROM FARM OPERATIONS,
W71-02035 05D

SEA GRANT ACTIVITIES.
W71-02054 09D

WISCONSIN UNIV., MADISON. DEPARTMENT OF SOIL SCIENCE
CHICAGO UNIV., ILL. AND CALIFORNIA UNIV., RIVERSIDE. DEPT. OF GEOLOGICAL SCIENCES.
EOLIAN SEDIMENT INFLUENCE ON PEDOGENESIS DURING THE QUATERNARY,
W71-01709 02G

WISCONSIN UNIV., MADISON. DEPT. OF CIVIL ENGINEERING.
OPTIMUM WASTE TREATMENT PLANT DESIGN UNDER UNCERTAINTY,
W71-01845 05D

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
BENTHIC BIOMASS AND SURFACE PRODUCTIVITY,
W71-01697 02L

A CONDUCTIVITY BRIDGE FOR THE MEASUREMENT OF SALINITY OF SEA WATER,
W71-01877 07B

WORLD HEALTH ORGANIZATION AND JOHN HOPKINS UNIV., BALTIMORE, MD. DEPT. OF SANITARY ENGINEERING.
CHARGES FOR TREATING INDUSTRIAL WASTE WATER IN MUNICIPAL PLANTS,
W71-01851 05D

WORLD METEOROLOGICAL ORGANIZATION, GENEVA (SWITZERLAND).
HYDROMETEOROLOGY DIV.
WORLD METEOROLOGICAL ORGANIZATION AND ITS PROGRAMMES IN HYDROMETEOROLOGY AND HYDROLOGY,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural Livestock Wastes at the Department of Agricultural Engineering of Iowa State University.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 4, NUMBER 5
MARCH 1, 1971

W71-02201 -- W71-02750

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 5
MARCH 1, 1971

W71-02201 -- W71-02750

of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD----------iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

ELECTROLYTIC CONDUCTANCE AND THE CONDUCTANCES OF THE HALOGEN ACIDS IN WATER,
National Bureau of Standards, Washington, D.C. Inst. for Basic Standards.
Walter J. Hamer, and Harold J. DeWane.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $0.50. National Standard Reference Data Series National Bureau Standards No 33, May 1970. 32 p, 1 fig, 19 tab, 80 ref, 3 append.

Descriptors: *Electrical conductance, *Halogens, *Water, Electrolysis, Acids, Aqueous solutions, Ionization, Electrodes, Temperature, Theoretical analysis, Methodology.
Identifiers: Specific conductance, Hydrofluoric acid, Hydrochloric acid, Hydrobromic acid, Hydriodic acid.

Definitions, symbols, general principles, and general laws related to electrolytic conductance of aqueous solutions are presented. General laws considered are Coulomb's law for charged bodies, Poisson's equation relating electrostatic potential to charge distribution, and Stokes and Oseen laws for the velocity of a sphere in a fluid medium. Relations between electrical resistance, electrical conductance, specific resistance, specific conductance, and equivalent conductance are presented. Theoretical expressions for equivalent conductance as derived by Debye, Onsager, and Fuoss are given. General methods of treating equivalent conductances of ionophores and ionogens, especially in regard to determination of limiting equivalent conductance, degree of ionic association, and degree of ionic dissociation are discussed. Data on equivalent conductances of the halogen acids, hydrofluoric, hydrochloric, and hydriodic acids in water cover a wide range of concentration and temperature. (Woodard-USGS)

WORLD HYDROLOGY: STATUS AND PROSPECTS,
Geological Survey, Washington, D.C.
Raymond L. Nace.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 1-10, July 1970. 10 p, 2 fig, 1 tab.

Descriptors: *Reviews, *Hydrology, *Hydrogeology, *International Hydrological Decade, Data collections, Sampling, Networks, Data processing, Analytical techniques, Hydrologic budget, Water balance, Synoptic analysis, Rainfall-runoff relationships, Hydrologic data.
Identifiers: Hydrologic data requirements.

Studies in hydrology in the IHD program are reviewed. Interpretation of hydrology and of the role of hydrologists in modern problems, however, must be very liberal, because water cannot be studied realistically independently of other factors in the environment, including biological factors. The ultimate aim of hydrological studies is to aid rational use of water for human purposes. Basic data are essential both for water development and for research. Basic data for all hydrological and related parameters are deficient for huge areas of the world and many development projects are being designed and constructed without an adequate base of data. Modern methods of systems simulation, data reduction, analysis and extrapolation make the apparent deficiencies in some kinds of data much less serious than they were a decade or two ago. New methods for quickly obtaining synoptic and sequential data for large areas also improve the prospects for world hydrology. (Knapp-USGS)
W71-02247

PRINCIPAL PROBLEMS OF MODERN HYDROLOGY,
State Hydrological Inst., Leningrad (USSR).
A. A. Sokolov.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 10-19, July 1970. 10 p.

Descriptors: *International Hydrological Decade, *Water balance, *Water resources development, Hydrologic budget, Gaging stations, Hydrogeology, Data collections, Reviews.
Identifiers: USSR.

Water balance studies are being used in the USSR to design reservoir systems on large rivers. For this purpose, 15 hydrometeorological observatories were established. Surface-groundwater relationships, irrigated-land salt balance problems, swamp hydrology, waterlogging of soils, drainage projects, and man's influence on water balance are also studied by the use of hydrologic budget methods. The methods reviewed may be used anywhere, and cooperation between nations in the IHD is intended to help assure their value. (Knapp-USGS)
W71-02248

THE WATER BALANCE OF THE OCEANS,
Main Geophysical Observatory, Leningrad (USSR).
M. I. Budyko.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 24-33, July 1970. 10 p, 2 tab, 30 ref.

Descriptors: *Water balance, *Oceans, Evaporation, Rainfall, Runoff, Hydrologic budget, International Hydrological Decade, Hydrologic cycle.
Identifiers: Oceanic water-balance.

Water exchange over the oceans has a determining influence on the water balance of our planet. Evaporation from the oceans amounts to 90% of the total evaporation from the earth's surface. The accuracy of estimating the components of the water balance of the Earth depends considerably on the accuracy of data on the water balance of the oceans. Several independent methods may be used to calculate precipitation and evaporation: (1) estimation of precipitation using observed data; (2) computation of precipitation; (3) estimation of evaporation without the use of data on radiation balance; (4) estimation of evaporation, taking into account computed radiation balance; and (5) estimation of evaporation, taking into account observed radiation balance. Estimation of evaporation without taking into account the data on radiation balance gives smaller values that seem to be less accurate than the results provided by the other 4 methods. In the World Ocean, estimated precipitation is 114 cm/yr, evaporation is 126 cm/yr, and inflow is 12 cm/yr. The total of precipitation and runoff for the Atlantic Ocean is smaller than the value of evaporation; the Atlantic Ocean receives water from other oceans, including the Arctic Ocean where evaporation is noticeably lower than the total of precipitation and runoff. (Knapp-USGS)
W71-02249

THE SCALE OF OCEANIC INFLUENCE ON CONTINENTAL PRECIPITATION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
P. S. Eagleson, and R. F. Lariviere.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 34-39, July 1970. 6 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Precipitation (Atmospheric), *Synoptic analysis, *Climatology, Rainfall, Rainfall disposition, Meteorological data, Regions, Surveys, Weather data, Statistical methods, Hydrologic cycle, Data collections, Correlation analysis.
Identifiers: Continental rainfall distribution, North America.

The serial correlation coefficient of monthly point precipitation at lag one is examined for a common fifty year period at thirty-seven stations spanning the North American continent. The geographical distribution of these coefficients shows significant values along the Pacific (windward) coast which decay Eastward becoming insignificant near the Mississippi River. This is interpreted as defining the spatial scale of maritime influence over precipitation on a windward land mass. (Knapp-USGS)
W71-02250

WATER BALANCE - INDIAN OCEAN,
Physical Research Lab., Ahmedabad (India).
K. R. Ramanathan, and P. R. Pisharoty.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 39-41, July 1970. 3 p.

Descriptors: *Water balance, *Indian Ocean, *Synoptic analysis, *Precipitation (Atmospheric), *Evaporation, Distribution patterns, Hydrologic cycle, Meteorological data, Precipitable water, Weather patterns, Oceans.
Identifiers: India, Water vapor flux.

The Indian Ocean provides the main moisture supply to the Southwest Monsoon, which causes abundant rainfall over India, Burma and Malaya. On the average, the precipitation and the evaporation appear to balance over the whole of the oceanic area on an annual basis. The annual evaporation is in excess of precipitation by more than 100 cm of water over parts of the Arabian Sea; the precipitation is in excess of evaporation by about 80 cm of water over considerable parts of the ocean off the Malayan and Indonesian Coasts. A significant portion of the moisture flux across the west coast of India is derived through evaporation from the Arabian Sea. The supply of water vapor to the Bay of Bengal branch of the Summer Monsoon appears to be derived through a northward flux across the equator east of longitude 70 deg E and through a westward flux across the Burma Malaya-Indonesian complex. Estimates of the net flux of water vapor into the Indian Sub-continent and the total rainfall over the same area, during a week of active monsoon, are respectively 2.06 times 10 to the 16th power and 2.14 times 10 to the 16th power gms per day. They appear to balance reasonably well. (Knapp-USGS)
W71-02251

THE HYDROLOGICAL CYCLE OF GREENLAND AND ANTARCTICA,
McGill Univ., Montreal (Quebec). Dept. of Meteorology.
Svenn Orvig.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 41-49, July 1970. 9 p, 18 ref.

Descriptors: *Water balance, *Hydrologic cycle, *Glaciers, Synoptic analysis, Heat budget, Ablation, Hydrologic budget, Precipitation (Atmospheric), Regimen, Sea level, Water storage, Ice, Storms, Weather patterns.
Identifiers: Ice caps, Greenland, Antarctica.

The great ice caps of Greenland and Antarctica hold most of the 75% of the world's fresh water which is stored as glacier ice. Greenland holds about 2.4 million cu km water and antarctica 20 million cu km. If it all melted, the sea level would be raised about 70 m. The atmosphere holds little water vapor over the ice caps, due to the low temperature. Greenland receives most of its precipitation by upper portions of middle latitude cyclones which often cross the ice cap. In the Antarctic, cyclonic storms seldom penetrate the continent, except for the western part. Precipitation measurements are always difficult in the polar regions, so it is more useful to assess the net water accumulation. The Greenland ice cap balance is negative at present, about 85 cu km water/year. The Antarctic ice budget seems to be positive, with an annual net gain probably around 600 cu km water. Recent times have seen a relatively stable sea level, which indicates that the great ice caps are more or less in equilibrium. Physical-mathematical models can be used to examine the energy and water balances over the snow surfaces. (Knapp-USGS)
W71-02252

SNOW COVER ON THE TERRITORY OF THE USSR AS A WATER BALANCE ELEMENT,
Hydrometeorological Research Center, Moscow (USSR).
V. D. Komarov, and E. G. Popov.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 49-54, July 1970. 6 p, 12 ref.

Descriptors: *Hydrologic budget, *Snowpacks, *Surveys, Remote sensing, Streamflow forecasting, Snowmelt, Hydrologic cycle, Heat budget, Reviews, Analytical techniques, Data collections.
Identifiers: USSR.

The influence of snow cover on river water regime and the hydrological cycle of the USSR is reviewed. Climatic conditions vary considerably; while some areas of the country are covered with snow for more than half a year, in other regions snow cover exists for less than a month. Over a major part of the lowland territory snow cover accumulates and remains for a period of 2 to 7 months. The winter average precipitation in the northern parts of the country amounts to 40-50% of the annual volume, in central parts the corresponding figure is about 30%, and in the south, about 15%. Snow cover observations have been conducted since 1892. Airsurvey and satellite surveillance are also used for mountain snow studies. A method of estimating the snowpack water equivalent in plains by means of airsurvey of natural soil gamma-radiation was developed in 1963. The standard error of the measured snowpack water equivalent at a 10 km course ranges from 5 to 7 mm or less than 10%. During the last few years the new method of snow cover survey has been systematically used in a number of river basins (the Volga, the Don, the Dnieper and others). (Knapp-USGS)

LAND GLACIATION PART IN THE EARTH'S WATER BALANCE,
Akademiya Nauk SSSR, Moscow. Institut Geografii.
V. M. Kotlyakov.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 54-57, July 1970. 4 p, 1 tab, 9 ref.

Descriptors: *Water balance, *Glaciers, Regimen, Ablation, Melting, Ice, Hydrologic budget, Discharge (Water), Water storage, Antarctic.
Identifiers: Ice caps, Greenland.

The mean duration of water storage on mountain-valley glaciers 10 km long is several hundred years. In the central part of the Antarctic ice sheet, deep layers of ice are 100-200 thousand years old. At present, glaciers cover 16.2 million sq km, about 11% of the land surface. The mean depth of ice is 1700 m and the maximum is in excess of 4000 m in Antarctica. The total volume of glacial ice on the Earth is estimated at 27 million cu km. This is 99% of the ice on our planet. A major portion of the ice is concentrated in Antarctica and Greenland. The remaining glacial regions account for less than 1%, but that comparatively small amount of ice plays an important part in the water balance of the separate regions of the earth. The total ice discharge in Antarctica and Greenland makes up 8% of the Earth's streamflow. Liquid runoff is 330 cu km of water a year and the remaining 280 cu km are solid runoff (iceberg calving). The southern hemisphere icebergs spread to latitude 46-55 deg S., and their total volume in the World Ocean can be estimated at 50% of annual streamflow of the Earth. (Knapp-USGS)

THE ROLE OF UNDERGROUND FLOW IN THE WATER BALANCE OF THE USSR,
State Hydrological Inst., Leningrad (USSR).
B. I. Kudelin, I. S. Zektser, and O. V. Popov.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 65-71, July 1970. 7 p, 1 tab, 6 ref.

Descriptors: *Water balance, *Groundwater movement, *Surface-groundwater relationships, Recharge, Discharge (Water), Runoff, Subsurface runoff, Streamflow, Hydrologic budget, Hydrogeology, Surveys.
Identifiers: USSR.

The mean groundwater flow to the rivers of the USSR equals about 24% of total streamflow and 9% of total precipitation. The total value of groundwater flow in the zone of active water exchange is 1,019 cu km per year. About 40% of the total precipitation on the territory of the USSR is discharged to rivers by surface and underground flow and 60% is lost by evaporation and deep underground flow. A short account is given of the main regularities of distribution of normal annual values of the modulus and coefficient of groundwater flow over the whole territory of the USSR and its individual regions. (Knapp-USGS)

EVALUATION OF THE GROUNDWATER BALANCE OF LARGE TERRITORIES,
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
A. A. Konoplyantsev.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 71-77, July 1970. 7 p, 1 fig, 8 ref.

Descriptors: *Water balance, *Groundwater, Synoptic analysis, Groundwater movement, Water storage, Water levels, Water level fluctuations, Surface-groundwater relationships, Runoff, Aquifers, Recharge, Hydrologic budget, Hydrogeology, Surveys.
Identifiers: USSR, Groundwater budget.

Calculation of the groundwater balance is essential to evaluation of the total water balance of large territories. To evaluate groundwater balance observation records of the groundwater regime, theoretically well-founded information of the change in the groundwater regime in area (in space) and cartographic measurement of changes in the groundwater balance on the territory are required. A good deal of work has already been done in this direction. These problems and studies are briefly reviewed. (Knapp-USGS)
W71-02256

ON THE ROLE OF UNDERGROUND STORAGE IN THE SETTING UP OF THE WATER BALANCE (FRENCH),
Gilbert Castany.
In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 78-83, July 1970. 6 p, 2 fig, 2 tab.

Descriptors: *Water balance, *Water storage, *Aquifers, *Hydrogeology, Rainfall-runoff relationships, Recharge, Infiltration, Groundwater movement, Hydrologic cycle, Discharge (Water), Evapotranspiration, Soil water movement, Hydrologic budget.
Identifiers: Groundwater budget.

Groundwater storage plays an important quantitative and qualitative part in mainland water balance. The characteristics of the ground surface regulate the rainwater distribution into runoff and infiltration. The natural retention ability of the aquifer provides temporary storage, which partly regulates flow rates. A bulk of water, which is not entirely negligible, is regularized by storage underground. This storage period is often longer than the reference period used for the statistical analysis of basic data. Hydrogeology must be considered in any areal water balance study. (Knapp-USGS)

APPLICATION OF THE SSARR MODEL TO A BASIN WITHOUT DISCHARGE RECORD,
Weather Bureau, Salt Lake City, Utah. Western Region.
Vail Schermerhorn, and Donald W. Kuehl.
Available from NTIS as PB-194 394, $3.00 in paper copy, $0.95 in microfiche. Essa Technical Memorandum WBTM WR55, August 1970. 7 fig, 7 ref.
Identifiers: *Hydrology, Models, *Flood forecasting, Washington (State), Watersheds, Rainfall, Snowmelt, Surface water runoff, Soil water, Stream flow, Simulation, Computer programming, SSARR (Streamflow Synthesis and Reservoir Regulation), Skokumchuck River.

Hydrologic models are usually designed and tested on basins where high quality data are available with adequate areal and time coverage. In operational forecasting the model must be applied where the forecast is needed and not necessarily where all desired data are available. The SSARR (Streamflow Synthesis and Reservoir Regulation) model was designed to be a general, flexible model with special provisions for use in daily river forecasting operations. In the present application, the model is used to answer a need for flood forecast service on the Skookumchuck River at Centralia, Washington. Streamflow data consist of short period gage height records, but no discharge information except for smaller headwater areas. Precipitation must be estimated from two stations in an adjacent watershed.

A SURVEY OF WATER BALANCE PROBLEMS, PROJECTS AND PROGRESS IN ALBERTA,
Meteorological Service of Canada, Calgary (Alberta). Watershed Research Program.
D. Storr.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 314-324, July 1970. 11 p, 2 fig, 18 ref.

Descriptors: *Water balance, *Synoptic analysis, *Project purposes, *International Hydrological Decade, Hydrologic budget, Hydrologic cycle, Reviews, Meteorology, Topography, Precipitation (Atmospheric), Runoff, Vegetation, Water storage, Evapotranspiration, Climatic data, Streamflow.
Identifiers: *Alberta (Canada).

Projects concerning water balance problems in Alberta, Canada are evaluated. Although termed one of the 'Prairie Povinces', less than 15% of the area can be called prairie. North of latitude 55 degrees most of the area is forest, lake, and swamp with only small enclaves of agricultural land. Similarly, the Rocky Mountains with heights up to 12,000 feet and their forested foothills remove a large portion of the southwest from the prairie classification. Human habitation, and hence hydrologic observation, is confined mainly to the agricultural area as there are only pockets of settlement in the northern forests and the mountain valleys. Most settlement has occurred since 1900 so the history of the hydrologic sciences in Alberta is quite limited. In the hydrologic sense, Alberta could therefore be classed with the 'developing countries'. Estimating precipitation, surface runoff, evapotranspiration and storage changes for such a nonhomogeneous area presents many problems. The achievement of a provincial water balance is hindered by large gaps in knowledge of basic hydrologic parameters. If a balance could be achieved by each of the ten I.H.D. projects considered, the relationships obtained would promote the achievement of a balance on the provincial scale. (Woodard-USGS)

WATER-BALANCE IN THE FEDERAL REPUBLIC OF GERMANY,
Freiburg Univ. (West Germany).
Reiner Keller.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 300-314, July 1970. 15 p, 6 fig, 1 tab, 14 ref.

Descriptors: *Water balance, *Foreign projects, Hydrologic cycle, Evapotranspiration, Precipitation (Atmospheric), Hydrologic budget, Meteorology, Surface waters, Synoptic analysis, Equations, Vegetation, Groundwater, Runoff, Water storage, Solar radiation, Soil properties, International Hydrological Decade.
Identifiers: *Federal Republic of Germany.

The calculation of the plan of water balance is divided into four steps: (1) Determination of the mean precipitation; (2) estimation of transpiration according to a special procedure and determination of evapotranspiration; (3) the total run-off obtained from the difference between recorded precipitation and calculated evapotranspiration; and (4) water demands of industry and municipalities. In the interpretation of the water-balance in the Federal Republic of Germany there are various conceptions which touch upon hypotheses and problems of ecological regional investigations. The close correlation between the ecological potential of a region and water-consumption, or evapotranspiration is controlled by the balance of radiation and soil characteristics. (Woodard-USGS)

METHODS FOR COMPILATION OF CURRENT WATER BALANCES OF RIVER DRAINAGE BASINS IN THE USSR,
State Hydrological Inst., Leningrad (USSR).
A. P. Bochkov, and A. B. Zavodchikov.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 274-280, July 1970. 7 p, 1 tab, 5 ref.

Descriptors: *Water balance, *Methodology, *Watersheds (Basins), Mathematical studies, Equations, Hydrologic cycle, Meteorology, Hydrologic budget, Synoptic analysis, Streamflow, Vegetation, Evapotranspiration, Water storage, Precipitation (Atmospheric), Groundwater, Surface waters, Soil water movement, Runoff, International Hydrological Decade.
Identifiers: *USSR.

In Russia water balances are computed for each month, season, and year for about 200 river basins including both large river systems and small experimental watersheds. However, due to the fact that the number of observation points for measuring various water balance components is not sufficient, computation of water balance for big rivers is performed by means of a simplified water-balance equation. Methods and examples of water balance computations are presented. (Woodard-USGS)

VERTICALLY DIFFERENTIATED WATER BALANCE IN TROPICAL HIGH MOUNTAINS - WITH SPECIAL REFERENCE TO THE SIERRA NEVADA DE SANTA MARTA/COLOMBIA,
Reimer Herrmann.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 262-273, July 1970. 12 p, 3 fig, 15 ref.

Descriptors: *Water balance, *Mountains, *Tropical regions, Hydrologic budget, Hydrologic cycle, Precipitation (Atmospheric), Soil moisture, Soil water movement, Evaporation, Runoff, Rainfall, Vegetation, Forests, Meteorology, Evapotranspiration, Slopes, Streamflow, Watersheds (Basins), Synoptic analysis, International Hydrological Decade.
Identifiers: *Columbia (South America).

The hydrological vertical zonation of tropical high mountains depends on their situation within the general circulation and on climatic differentiation caused by local exposure. Thus a variety of different hydrological altitudinal zones exists. The lee type sequence of the trade wind zone is explained using the northwestern Sierra Nevada de Santa Marta/Colombia as an example. The Sierra climbs steeply direct from sea level to a height of approx. 6000 m. The profile begins with the region of the driest climate on the Caribbean coast. This dry climate is caused by dry, hot katabatic winds (R. Herrmann 1970b), stress-differential induced divergence (R.A. Bryson and P.M. Kuhn 1961) and leeside divergence (F. Lahey 1958). As the dry katabatic winds are limited to the coastal heights and the floodplain of the Rio Gaira in the profile, and as at growing distance from the coast the stress-differential induced divergence and the leeside divergence diminish, there develops strong slope convergence connected with higher tendency for rainfall. By means of the least square method the vertical variation of rainfall may be described making it easy to find the height of maximum rainfall at 1660 m. But above this in the zone of tropical ombriphilous cloud forest there is additional rainfall by fog drip, which indicates that the hydrological effective maximum may be at a height of about 2300 m. The whole survey was made among natural plant formations or among secondary plant formations similar to the natural ones. The vertical zonation of the water balance follows the vertical zonation of plant formations beginning at sea level. The soil moisture pressure dynamics are explained by means of isopleths. (Woodard-USGS)

COMMENTS ON WATER BUDGET INVESTIGATIONS, ESPECIALLY IN TROPICAL AND SUBTROPICAL MOUNTAIN REGIONS,
Bonn Univ. (West Germany).
H. Flohn.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 251-262, July 1970. 12 p, 4 fig, 2 tab, 26 ref.

Descriptors: *Water budget, *Mountains, *Subtropic, *Tropical regions, Water balance, Hydrologic budget, Hydrologic cycle, Water vapor, Streamflow, Runoff, Model studies, Equations, Precipitation (Atmospheric), Valleys, Meteorology, Synoptic analysis, International Hydrological Decade.
Identifiers: *Surface energy, South America, Africa, Southern Asia.

Three different techniques are used to evaluate the water budget of a given area: hydrological balance, surface energy budget, and evaluation of the divergence of the atmospheric water vapor transport. Due to deficiencies of available observations, relatively large systematic and random errors are unavoidable and necessitate the comparative (and critical) use of different techniques. In tropical and subtropical mountains local daytime circulations lead to a systematic underestimate of rainfall measured at most valley stations. In contrast to the daytime circulations, the effect of the reversed nighttime circulations on the precipitation pattern is much more infrequent. Some examples are demonstrated. (Woodard-USGS)

MEANING OF WATER BALANCE IN WARM HUMID ISLANDS,
National Research Center for Disaster Prevention, Tokyo (Japan).
M. Sugawara.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 243-250, July 1970. 8 p, 6 fig, 1 tab.

Descriptors: *Water balance, Humid areas, *Hydrologic cycle, Hydrologic budget, Floods, Meteorology, Streamflow, Model studies, Rainfall, Runoff, Water resources, Evaporation, Synoptic analysis, International Hydrological Decade, Foreign projects.
Identifiers: *Japan.

Annual precipitation is much greater than annual evapotranspiration on Japan's warm humid islands. Heavy storms and floods are frequent. Therefore, if we make a balance sheet of water, large errors may be on both sides, one from the heavy storm another from the flood. A way of avoiding this defect is to classify the precipitation and the discharge by their quantities. Then heavy storms may correspond mainly to floods and their large errors cancel each other. This classification merely by the quantity has some defects, because it does not contain the concept of time. One way to consider the effect of time is to classify the precipitation by runoff models. This method is especially important in humid regions where the greater part of precipitation turns into surface discharge. Classification of precipitation and discharge is important not only for avoiding the errors as described, but also for the water use. (Woodard-USGS)

EVALUATION OF RESOURCES OF SHALLOW AQUIFIERS (IN FRENCH),
R. Degallier, and C. Joseph.
English, Spanish and Russian abstracts. In: Symposium on World Water Balance, Vol 1, International Association of Scientific Hydrology Publication No 92, p 84-99, July 1970. 16 p, 5 plate, 1 tab, 5 ref.

Descriptors: *Water levels, *Water level fluctuations, *Water balance, *Groundwater, *Computer programs, Rainfall, Surface-groundwater relation-

ships, Hydrologic cycle, Antecedent precipitation, Infiltration, Aquifers, Mathematical models, Water storage.
Identifiers: Rainfall-recharge relationships.

Excellent correlations have been obtained between rainfall cumulative departure curves and ground water levels, in climates as different as those of Sahara, equatorial forest, African savannah and France. The rainfall function may include a phase-shifting module simulating the time for transfer through the soil, a threshold module excluding the small showers in periods of soil moisture deficit, a subroutine stopping the correlation when the water table has reached the soil surface, and a possibility of taking into account either increasing or decreasing water levels. Applications of the method are shown and a FORTRAN computation program is appended. This method can help to predict groundwater level fluctuations and can compare groundwater recharge over long distances. (Knapp-USGS)

WATER RESOURCES RESEARCH IN MINNESOTA BY THE NORTH CENTRAL FOREST EXPERIMENT STATION,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
Roger R. Bay.
Proc Conference on Ongoing Water Resources Research in Minnesota, March 1970. Univ of Minn. Water Resources Research Center Bul 21, p 40-56, June 1970.

Descriptors: *Bogs, *Organic soils, *Peat, *Minnesota, *Wetlands, Swamps, Demonstration watersheds, Streamflow, Forestry, Groundwater, Evapotranspiration, Soil physical properties, Water table, Water yield improvement.
Identifiers: *Peatlands, *Wetland hydrology, *Experimental watersheds, Forest hydrology, Watershed management research.

Describes general research in peatland hydrology conducted by the U.S. Forest Service in northern Minnesota. Experimental watershed studies on individual peat bog basins are concerned with water quantity and water quality from natural bog areas and as influenced by forestry practices. Other studies include the relationship between local groundwater systems and bog water tables, the investigation of physical and hydrologic properties of organic soils, and evapotranspiration and energy balance measurements on various bog vegetation systems. AREAL COVERAGE OF PRECIPITATION IN NORTHWESTERN UTAH,
Weather Bureau, Salt Lake City, Utah. Western Region.
Philip Williams, Jr., and Werner J. Heck.
Available from NTIS as PB-194 389, $3.00 in paper copy, $0.95 in microfiche. Essa Technical Memorandum WBTM WR56, Sept. 1970. 20 p, 8 tab, 5 fig, 3 ref.
Identifiers: *Atmospheric precipitation, *Utah, Probability, Networks, Weather forecasting, Periodic variations, Weather stations, Accuracy.

Areal coverage of precipitation in a dry region, such as northwestern Utah would be expected to be lower than in a moist area like Kentucky. This small areal coverage would have a marked effect on the degree to which Salt Lake City PoP forecasts could improve over climatological forecasts. The purposes of this study are to determine: (1) the frequency distribution of areal coverage on percipitation days in northwestern Utah during various seasons of the year, and (2) the maximum possible improvement of forecast Brier Scores over climate Brier scores.

Available from NTIS as PB-194 221, $3.00 in paper copy, $0.95 in microfiche. Essa Technical Memorandum EDSTM 12, December 1969. 15 p, 2 tab, 8 fig.

Descriptors:
Identifiers: *Snowfall, Statistical data, *Snow cover, Seasonal variations, Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island.

Seasonal total snowfall averages and extremes, frequencies of various snowfall intensities from 1 to 8 inches in a day, and snow cover data are presented in a series of 8 maps and 2 tables. Some notes on difficulties in obtaining good snowfall data are included. Nearly 100 stations were studied for snowfall frequency and snow cover data, using around 30 years of record per station if available. None with less than 10 years of record were used. Results show a several-fold increase in seasonal snowfall, in days with 1 inch or more of snowfall, and in maximum snow cover depth, from the southeastern coastal area to the north and to higher elevations. Frequencies of heavy snowfalls, of 8 inches or more in a day, however, are more uniform over New England, averaging mostly once or twice a year. The monthly distribution of 1 and 4 inch daily snowfalls are shown.

CALCULATION OF PRECIPITABLE WATER,
Weather Bureau, Silver Spring, Md. Technique Development Lab.
L. P. Harrison.
Available from NTIS as PB-193 600, $3.00 i paper copy, $0.95 in microfiche. Essa Technica Memorandum WBTM TDL 33, June 1970. 61 p, fig, 3 tab, 118 ref.
Identifiers: *Atmospheric precipitation, Measure ment, Radiosondes, Water vapor, Boundary valu problems, Dew point, Humidity.

Two methods of calculating precipitable water ar given in terms of data obtainable from a radiosond or rawinsonde observation. Method I is based o the premise that aqueous vapor pressure (or dev point) and temperature are reported for deter mined geopotential levels or geometric altitude with reference to mean sea level; while Method II i predicated on the basis that aqueous vapor pres sure (or dew point) is reported for respectiv specified barometric pressure levels whos geopotentials are computed by means of the dat obtained in the sounding. Thus, under Method I th precipitable water is calculated by numerical in tegration such that the variable of integration i either geopotential or geometric altitude, an under Method II it is calculated by such procedure that the variable of integration is pres sure. In either case one may choose to assume ar bitrarily that the acceleration of gravity g is cor stant, thus implicitly giving rise to a small syste matic error; or one may treat the problem in a mor accurate manner by taking g as a known function o latitude and geopotential (or geometric altitude Procedures covering all of these alternatives ar presented.

ATMOSPHERIC-AND SOIL-INDUCED WATE STRESSES IN PLANTS AND THEIR EFFECT ON TRANSPIRATION AND PHOTOSYNTHES IS,
Agricultural Research Service, Phoenix, Ari Water Conservation Lab.
S. B. Idso.
Journal of Theoretical Biology, Vol 21, p 1-1 1968. 9 fig, 11 ref.

Descriptors: *Photosynthesis, *Transpiratio *Moisture stress, *Humidity, *Soil-water-plan

relationships, Soil water, Irrigation practices, Free energy, Leaves, Thermodynamic behavior, Soil structure, Soil properties, Theoretical analysis, Root systems, Moisture tension, Atmosphere, Soil physical properties, Vapor pressure, Moisture deficit, Rates of application.
Identifiers: *Diffusion pressure deficit (DPD), *Water potential, Chloroplasts, Evaporative demand.

It is proposed that the general phenomenon of 'water stress' is composed of 2 nearly independent phenomena involving photosynthesis and transpiration. Developing appropriate theoretical considerations, it is shown that plant diffusion pressure deficit (DPD) may be lowered by a maximum of only 2 atm by increasing relative humidity (or decreasing evaporative demand) from 40-98%. Alternatively, photosynthesis, which is a function of the absolute free energy of water in the vicinity of chloroplasts, varies from 0-23 atm DPD, which may be traversed by changing the free energy of the soil moisture from 0 to 2 or 3 atm. From these and similar considerations, it is concluded that photosynthesis is 90% decoupled from atmospheric moisture and transpiration is independent of soil moisture to a similar degree. It is then shown from the data of various workers that, owing to these differing stress factors, photosynthetic rates may increase in response to water applications that have already effected maximum transpiration rates. These ideas are discussed as factors in irrigation practices and it is felt that in certain situations where other factors, such as soil properties and light intensity are favorable, repeated water applications beyond maximum transpiration levels may result in higher irrigation yields. Identifiers: *Saltbush, *Gas exchange, *Plant adaptations.

High temperatures during growth in plants result in higher photosynthesis temperature optima than when grown at lower temperatures. This is thought to be a multiple biochemical mechanism somatic tissue adaptation which facilitates organismic compensation for seasonal environmental fluctuations. It is unclear to what extent this adaption is controlled by genetic properties. The desert saltbush (Atriplex polycarpa) is distributed widely in southwestern deserts of differing mean annual temperatures. Plants were grown from seeds of 3 isolated populations from areas of differing mean temperature and preconditioned in 3 temperature regimes (5-16 deg. C., 21-32 deg. C. and 32-43 deg. C.). Dark respiration as measured by carbon dioxide evolution was determined in each temperature range (5, 10, 25 and 40 deg. C.). Results indicated that plants from warm areas had less capacity to adapt to cold temperatures than plants from cold areas. This suggests intraspecific differences in acclimation potential. TRITIUM COLLECTION AND EXTRACTION TECHNIQUES FOR PLANT-WATER RELATIONSHIP STUDIES,
Texas A and M Univ., College Station. Dept. of Range Science.
S. E. Young, J. D. Dodd, and E. R. Ibert.
Ecology, Vol 51, No 3, p 535-537, Late Spring 1970. 3 fig, 10 ref. AEC Contract No AT- (40-1)-3488.

Descriptors: *Tritium, *Radioactivity techniques, *Laboratory equipment, *Transpiration, *Cacti, Xerophytes, Vacuum drying, Quenching, Tracers, Freeze drying, Water balance, Water vapor, Water loss, Vapor pressure, Plant tissues, Analytical techniques, Water circulation.
Identifiers: *Hygrothermographs, *Vapor pressure deficit, Plant-water relationships, Combustion.

The advantages of tritium as a plant-water tracer are outlined. Tracer techniques were developed for measuring water movement and water loss in the pricklypear cactus (Opuntia spp.). Plants were injected with tritiated water of varying specific activities. Transpired vapor was collected by using a vacuum pump to pass dry air over the plant surface and into collecting vials. Hygrothermograph recordings were used to determine vapor pressure deficit values. Tissue water was extracted by freeze-drying in cold water and by warm water. Combustion values obtained indicated this tracer technique is effective when extraction time is 8 hrs. With slight equipment modifications, the technique should be applicable to other plant species. (Casey-Arizona)

2E. Streamflow and Runoff

ERROR CRITERIA IN WATER SURFACE PROFILE COMPUTATIONS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
Edward A. McBean, and Frank E. Perkins.
Available from NTIS as PB-196 120, $3.00 in paper copy, $0.95 in microfiche. Massachusetts Institute of Technology Hydrodynamics Laboratory Report No 124, June 1970. 167 p, 25 fig, 20 tab, 25 ref, 3 append. OWRR Project C-1495 (No 1988), (3).

Descriptors: *Mathematical studies, *Streamflow, *Flow profiles, *Water levels, *Stage-discharge relations, Data processing, Equations, Mathematical models, Computer programs, Numerical analysis, Programming languages, Mannings equation, Channel morphology, Supercritical flow, Turbulent flow, Profiles.
Identifiers: *Error calculations, *Backwater profiles.

Numerical error generation properties and the effects of data uncertainty are analyzed for several of the most common methods used in water surface profile computations. Theoretical equations are developed that serve as bounds on the actual errors that are introduced during the computation. The analysis also provides criteria which may be used in the rational selection of the calculation increment. In most engineering applications the effect of numerical errors on the computed profile will be considerably smaller than that due to data uncertainty. When numerical error generation is significant, it is predictable through the error bound equations. The successive substitutions algorithm, presently used in most computer programs for convergence of the iteration scheme, sometimes encounters difficulties due to convergence to incorrect profiles and failure to converge; application of the bisection algorithm eliminates these problems. (Knapp-USGS)

NUMERICAL SOLUTION OF UNSTEADY FLOWS IN OPEN CHANNELS,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
Daniel J. Gunaratnam, and Frank E. Perkins.
Available from NTIS as PB-196 159, $3.00 in paper copy, $0.95 in microfiche. Massachusetts Institute of Technology Hydrodynamics Laboratory Report No 127, July 1970. 259 p, 76 fig, 11 tab, 42 ref, 4 append. OWRR Project C-1495 (No 1988), (2).

Descriptors: *Routing, *Computer programs, *Open channel flow, *Unsteady flow, *Equations, Streamflow forecasting, Water storage, Flood forecasting, Runoff forecasting, Linear programming, Waves (Water), Tides, Bores, Tidal effects, Hydraulic models.
Identifiers: *Unsteady open channel flow.

A finite difference scheme was developed to integrate the St. Venant Equations over a wide range of transient flow conditions. The scheme was incorporated into a useful computer program. Systematic testing compared the difference scheme with observed data and linearized analytical solutions. The weighted residual method using the Galerikan technique of minimizing proved to be a relatively simple method for deriving a minimum error finite difference scheme. Solution of the set of simultaneous algebraic equations generated by the implicit difference scheme was effected using the influence function method. This provides a very efficient procedure for solving the equations associated with a network of channels. (Knapp-USGS)

IMPLICIT FLOOD ROUTING IN NATURAL CHANNELS,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering; and Virginia Inst. of Marine Science, Gloucester Point.
Michael Amein, and Ching S. Fang.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY12, Paper 7773, p 2481-2500, December 1970. 20 p, 10 fig, 1 tab, 24 ref, append. OWRR Project A-001-NC.

Descriptors: *Flood routing, *Computer programs, *Open channel flow, *Unsteady flow, Mathematical models, Numerical analysis, Digital computers, Floods, Channel morphology, Linear programming.
Identifiers: Implicit flood-routing methods.

Flood routing and many other applications in hydraulic engineering are based on the solution of the equations of unsteady flow and require fast and accurate numerical methods. An implicit numerical method which is both fast and accurate can be established on the basis of: (1) A centered difference scheme to represent the primary differential equations in finite difference form; and (2) the simultaneous solution of the finite difference equations for each time step. The difference equations constitute a system of nonlinear algebraic equations which can be solved on a digital computer by Newton iteration method. The computational scheme becomes very efficient when advantage is taken of the sparseness of the matrix of coefficients of the linear systems employed in the iteration. Applications of the implicit method show that it can be conveniently used for highly irregular channels. (Knapp-USGS)

W71-02246

HYDROGEOLOGIC DATA FOR THE SOUTHWESTERN COASTAL RIVER BASINS, CONNECTICUT,
Geological Survey, Hartford, Conn.

Mendall Thomas, Robert B. Ryder, and Chester E. Thomas, Jr.
Connecticut Water Resources Bulletin No 18, 1969. 45 p, 2 fig, 1 plate, 8 tab, 16 ref.

Descriptors: *Water resources, *Water quality, *Hydrologic data, *Connecticut, Surface waters, Groundwater, Chemical analysis, Observation wells, Water levels, Streamflow, Flow rates, Precipitation (Atmospheric), Lakes, Reservoirs, Data collections, Hydrogeology.
Identifiers: *Basic data.

Hydrologic and geologic data collected by the U.S. Geological Survey during an investigation of water resources in cooperation with the Connecticut Water Resources Commission is presented. These basins occupy about 394 square miles in Connecticut and 46 square miles in New York, including the towns of Greenwich, Stamford, Darien, New Canaan, Norwalk, Wilton, Westport, Weston, Fairfield, Easton, and Bridgeport, and parts of Danbury, Ridgefield, Redding, Bethel, Newtown, Trumbull, Monroe, Shelton, and Stratford. The data include records of 391 wells, graphical logs of 144 wells and 319 test holes, laboratory analyses of the grain size of 39 samples of stratified drift, and data from 5 pumping tests. Partial records of streamflow were collected at 19 gaging stations. At these gaging stations, from 1 to 18 discharge measurements and from 1 to 40 stage measurements were made during the period September 1960 to September 1965. From stage-discharge relationships based upon the discharge measurements, discharges were determined corresponding to the stages measured. A list of discharge determinations for all partial-record gaging stations is included, and chemical quality analyses are tabulated. (See also W71-01912). (Woodard-USGS)

George Terzidis, and Theodor Strelkoff.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY12, Paper 7780, p 2581-2610, December 1970. 30 p, 16 fig, 32 ref, append. OWRR Project B-037-CAL.

Descriptors: *Surges, *Bores, *Unsteady flow, *Supercritical flow, Mathematical models, Hydraulic models, Open channel flow, Waves (Water), Computer models, Hydraulic jump.
Identifiers: *Open channel shocks, Method of characteristics.

Unsteady flows in fixed-bed open channels are computed on the basis of the same assumptions as those for steady, gradually varied flow, the key one being hydrostatic pressure distribution in every cross section. The St. Venant equations for this case commonly are solved either by the method of characteristics or by finite differences in a rectangular network. Positive waves are characterized by converging characteristics; once these intersect a bore or shock forms, and many customary methods of solution fail. The equations of motion for flow with and without shocks are compared, the generation of bores is analyzed by exact solution of characteristic equations, and several numerical schemes are presented for through-computation of unsteady flows that may contain shock zones. Comparison is made between computed results and experimental data gathered for a variety of cases; corroboration is generally good. (Knapp-USGS)

POTAMOLOGY DATA COLLECTION ON LOWER MISSISSIPPI RIVER,
Army Engineer District, Vicksburg, Miss. River Stabilization Branch.
Charles M. Elliott.
ASCE Proceedings, Journal of the Waterways, Harbors and Coastal Engineering Division, Vol 96, No WW3, Paper 7466, p 601-622, August 1970. 22 p, 14 fig, 4 ref.

Descriptors: *Data collections, *Hydrologic data, *Potamology, *Mississippi River, Sediment transport, Sedimentary structures, Channel morphology, River training, Flood control, Hydrography, Navigation, Surveys, Stream gages, Gaging stations.
Identifiers: *Potamology data.

The potamology data collection program of the U. S. Army Corps of Engineers, Vicksburg District, is designed to provide adequate, dependable data on the behavior of the Lower Mississippi River. The data are being used to establish guidelines for effectively and economically stabilizing the river for flood control and navigation. Channel stabilization problems involve not only the most feasible means of stabilizing specific reaches of the river, but also long-range predictions of natural and man-caused changes in river regime. The data being collected are hydrographic surveys, bed form profiles, current direction, discharge and horizontal velocity distribution, bed material and suspended sediment samples, and water surface profiles. Emphasis is placed on standardized data documentation in order to minimize the amount of time necessary to prepare the data for study and to enable personnel who are relatively unfamiliar with the details of the program to use the data confidently. (Knapp-USGS)
W71-02438

FACTORS CONTRIBUTING TO UNUSUALLY LOW RUNOFF DURING THE PERIOD 1962-68 IN THE CONCHO RIVER BASIN, TEXAS,
Geological Survey, Austin, Tex.
Stanley P. Sauer.
Geological Survey Open-file Report (Texas Dist Rep No 112), August 1970. 85 p, 29 fig, 16 tab, 26 ref.

Descriptors: *Droughts, *Runoff, *Low flow, *Evaluation, *Texas, Hydrologic data, Surface waters, Streamflow, Flow rates, Water yield, Consumptive use, Vegetation, Rainfall-runoff relationships, Climatology, Topography, Maps, Hydrographs, Statistical methods, Groundwater, Groundwater movement.
Identifiers: *Concho River basin (Tex).

To determine the reasons for the unusually low runoff in the Concho River basin during the period 1962-68, the physical developments and climatic changes in the basin were identified and related to changes in the regimen of streamflow. Land use, brush infestation, and land-treatment practices have not caused significant changes in the rainfall-runoff relationship. The use of surface-water for irrigation has increased very little during the past 70 years, and although the use of groundwater for irrigation has greatly increased in the past 25 years, springflow has not been significantly diminished. The base flow of the streams is materially reduced by surface-water irrigation diversions. Diversions for municipal and industrial use have increased rapidly, but these diversions affect only the streamflow downstream from San Angelo. The analyses of rainfall-intensity and runoff data indicate that the basic cause for the relatively low runoff during the period 1962-68 was the lack of high-intensity long-duration storms. Coefficients of variation ranged from 0.8 to 1.4, and first-order serial correlations ranged from 0.01 to 0.28. Drought recurrence interval of the report period is about 200 years. (Woodard-USGS)
W71-02448

WATER-RESOURCES INVENTORY SPRING 1968 TO SPRING 1969--ANTELOPE VALLEY-EAST KERN WATER AGENCY AREA, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
William R. Powers, III.
Geological Survey Open-file Report, July 1970. 15 p, 8 fig, 3 tab, 2 ref.

Descriptors: *Water resources, *Semiarid climates, *California, Groundwater, Surface waters, Rainfall, Runoff, Evaporation, Data collections, Water table, Aquifers, Water yield, Streamflow, Flow rates, Meteorological data, Hydrologic data, Climatic data, Hydrographs.
Identifiers: Mojave Desert region (Calif), *Water inventory.

This is the third annual report prepared by the U.S. Geological Survey in cooperation with the Antelope Valley-East Kern Water Agency (AVEK) to assist the agency in its program of basin management. As part of that program, streamflow, precipitation, evaporation, and groundwater data are being collected on a continuing basis by the U.S. Geological Survey. These hydrologic data are being analyzed annually. The AVEK area is about 35 miles north of Los Angeles, Calif., in the southwestern part of the Mojave Desert region, covering part of the northeastern section of Los Angeles County and part of the southeastern part of Kern County. The AVEK area is in the area of Lancaster, Mojave, and Palmdale. Precipitation, evaporation, streamflow, and groundwater levels analyzed from spring 1968 to spring 1969 show that precipitation and runoff were below normal, evaporation was about normal, and water levels continued to decline at about the same rate as in the past--about 8 feet per year in the area of maximum decline. Ludwig Luckner, and Dietmar Peukert.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 423-432, 1969. 10 p, 4 fig, 5 ref.

Descriptors: *Groundwater movement, *Flow, *Analog models, Mathematical studies, Equations, Aquifer characteristics, Storage capacity, Transmissivity, Flow characteristics.

For nonstationary vertical plane and axial rotational symmetric groundwater flow fields having a free surface, the fundamentals of simulation are found on electrically conducting paper, in the electrolytic tank, and in R-networks drainage wells for the drainage of open-work minings. The dependence of the profile transmissibility on the potential in the horizontal plane flow can be simulated by means of R-networks if the time variable is discretional. The profile transmissibility to be simulated can be maintained constant when adopting correction currents. Based on these possibilities the fundamentals of two methods are described where the entire nonlinearity is concentrated in the potentials applied at the time resistors. These methods represent a good base for hybrid calculations. (Woodard-USGS)

French summary. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 433-440, 1969. 8 p, 5 fig, 4 ref.

Descriptors: *Groundwater movement, *Saline water, *Flow characteristics, *Aquifers, Beaches, Mathematical studies, Equations, Theoretical analysis, *Saline water intrusion, Saline water-freshwater interfaces.
Identifiers: *Salt-water wedge, Coastal aquifers.

Transitional characteristics of salt-water wedges in unconfined aquifers are investigated with special consideration to the effects of changes in freshwater depth at coastal line, and deformations of the shape of moving interfaces. Theoretical treatments concerning wedge intrusion, when a barrier is abruptly removed, are made. The results are compared to the experimental data, and a fair agreement between theory and experiment are obtained. (Woodard-USGS)

French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 401-409, 1969. 9 p, 1 tab. 1 ref.

Descriptors: *Groundwater movement, *Mathematical models, Fluid mechanics, Hydraulic conductivity, Theoretical analysis, Saturated flow, Unsaturated flow, Aquifer characteristics, Soil profiles, Flow, Diffusion, Boundaries (Surface), Velocity, Equations, Density, Gravity, Kinetics.

The mathematical model for all kinetic processes of the law consists of conservation of energy, the law of conservation of matter, validity laws and equations of boundary conditions. The kinetic laws can be derived theoretically as force equilibrium laws (special forms of the law of the conservation of energy) for the saturated and unsaturated filter flow. Thus these previously empiric laws turn to theoretically based fundamental laws so that clear statements can be made as to their limitations of validity. The laws of conservation of mass serve as special forms of the law of conservation of matter for mathematical models of groundwater movement where the following laws can be derived: one law in the interior of the field, one law at the free surface which can be considered as the boundary condition, and one law comprehending all the flow and storage processes. The most important mathematical models of groundwater flow are summarized in a table. (Woodard-USGS)

SOME LIMITATIONS OF SEISMIC REFRACTION METHODS IN GEOHYDROLOGICAL SURVEYS OF DEEP ALLUVIAL BASINS,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
D. E. Wallace.
Groundwater, Vol 8, No 6, p 8-13, November-December 1970. 6 p, 5 fig, 1 tab, 11 ref.

Descriptors: *Hydrogeology, *Seismic studies, *Water table, *Arizona, Alluvium, Exploration, Geology, Mapping, Geophysics, Water levels, Geology, Aquifers, Permeability, Transmissivity, Groundwater movement.
Identifiers: *Groundwater prospecting, Tombstone (Ariz), Walnut Gulch Experimental Watershed, Experimental watersheds.

Seismic methods combined with available well and geologic data were used to define the subsurface hydrologic and geologic conditions of the Walnut Gulch Experimental Watershed, a deep, alluvial basin near Tombstone, Arizona. Seismic determinations revealed depths to the water table ranging from near zero to 475 feet in the central portion of the watershed. The accuracy of predicting the depth to either groundwater or basement was 6 percent, while that for groundwater alone was 10 percent. The great depths of alluvium created the problem of estimating the seismic traverse length necessary to accurately determine the alluvium-basement interface. Increased compaction of alluvium with depth causes additional interpretation difficulties in some areas. Also, water-table eleva-

tion may not always be accurately determined above and close to a higher velocity layer. Gravity or well log information greatly increases the reliability of seismic information. (Knapp-USGS)

GROUNDWATER AVAILABILITY IN FORD COUNTY,
Illinois State Water Survey, Urbana.
James P. Gibb.
Illinois State Water Survey Circular 97, 1970. 66 p, 13 fig, 2 tab, 24 ref, 2 append.

Descriptors: *Groundwater, *Water resources, *Illinois, Geology, Aquifers, Wells, Geologic mapping, Groundwater movement, Water table, Water supply, Water quality, Chemical analysis, Data collections, Aquifer characteristics, Water yield, Specific capacity, Consumptive use.
Identifiers: *Ford County (Ill).

Groundwater in Ford County, Illinois normally can be obtained from one of two primary water-bearing units within the glacial drift or from the underlying bedrock formations. The drift deposits consist of the Wisconsinan, Illinoian, and Kansan age glacial materials underlain by Pennsylvanian, Mississippian, Devonian, and Silurian age bedrock formations. Glacial deposits of Wisconsinan age provide approximately 64 percent of the county's current water supply. An estimated 2.2 million gallons of water are pumped from the aquifers of Ford County each day to satisfy industrial, municipal, domestic, and rural needs. A much larger quantity of water, perhaps as much as 51 million gallons a day, could probably be withdrawn without overdevelopment. Maps and tables indicating the probable maximum depth of wells, water levels, chemical quality, and general groundwater conditions for each water-bearing unit at specific locations are presented to serve as a guide in the development and utilization of the groundwater resources of Ford County. (Woodard-USGS)

GEOLOGY AND GROUNDWATER RESOURCES OF LINN COUNTY, IOWA,
Geological Survey, Iowa City, Iowa.
Robert E. Hansen.
Iowa Geological Survey Water Supply Bulletin No 10, 1970. 66 p, 25 fig, 6 plate, 8 tab, 33 ref.

Descriptors: *Groundwater, *Water resources, *Geology, *Iowa, Aquifers, *Aquifer characteristics, Water yield, Water quality, Chemical analysis, Water supply, Consumptive use, Data collections, Water levels, Water sources, Hydrologic data.
Identifiers: *Linn County (Iowa).

Linn County, in east-central Iowa, covers about 713 square miles and lies in the Western Young Drift section of the Central Lowlands physiographic province. The normal annual rainfall in the county is about 33 inches and the annual mean temperature is about 48 degrees F. The population in 1960 was 136,899, of which 75 percent was urban. Groundwater sources involving the identification and delineation of the water-bearing rock units and an evaluation of the availability, yield, and chemical quality of water contained in these rocks are presented. This information will supply the data necessary to determine alternate sources of groundwater in problem areas and to define the most favorable groundwater sources for future needs. The principal aquifers are alluvium, buried channel deposits, Silurian-Devonian limestones and dolomites, and the Jordan Sandstone. All yield fair-to-good quality water, although the water is hard and locally contains high concentrations of iron. All are capable of yielding as much as 500 gallons or more per minute to wells. (Woodard-USGS)
W71-02450

DIGITAL SIMULATION OF THE OGALLALA AQUIFER IN SHERMAN COUNTY, KANSAS,
Kansas State Geological Survey, Colby.
Thomas J. McClain.
Geological Survey Open-file Report, 1970. 30 p, 10 fig, 3 tab, 11 ref.

Descriptors: *Groundwater, *Water resources, *Kansas, *Computer models, Computer programs, Water supply, Consumptive use, Observation wells, Data collections, Hydrologic data, Water table, Aquifer characteristics, Water yield, Future planning (Projected), Digital computers, Equations, Water levels.
Identifiers: *Ogallala aquifer, *Sherman County (Kan).

An area of 340 square miles was selected for developing a digital computer model of the Ogallala aquifer. The digital model was adapted to simulate inflow, outflow, water levels, recharge, transmissivities, storage coefficients, saturated thickness, and discharge. The model was tested and found to be compatible with actual field conditions during the period 1966 through 1969. It was then programmed to define the effects on water levels of future development (1970 through 1989). With the continued groundwater development and annual pumpage assumed, digital model computations indicate a depletion of the aquifer in the area studies by 19 percent by 1981 and 40 percent by 1990. With no increase in development or annual pumpage from 1970 through 1989, model computations indicate that the aquifer could be depleted by 26 percent. A storage coefficient of 0.15 was used in this study but computations indicate that a slightly larger storage coefficient of 0.16 or 0.17 could have been used. (Woodard-USGS)

GROUNDWATER IN MONTANA,
Montana Bureau of Mines and Geology, Butte.
Miller Hansen.
Montana Water Resource Board Inventory Series Report No 16, November 1969. 145 p, 59 fig, 3 tab, 6 ref.

Descriptors: *Groundwater, *Water resources, *Montana, Aquifers, Water yield, Storage, Recharge, Water quality, Geology, Aquifer characteristics, Wells, Precipitation (Atmospheric), Water table, Pumping, Hydrologic data, Springs, Water levels, Domestic water, Irrigation, Specific capacity, River basins, Maps.

Published groundwater reports and other reports containing information required in estimating availability of groundwater in Montana, were reviewed, summarized, and compiled into one publication. The unconsolidated aquifer summaries provide information that includes aquifer area, thickness, specific yield, groundwater in storage, perennial recharge, and water quality in each report area. The unconsolidated aquifers are grouped by drainage basins in this compilation. More than 42,000 wells and 18,000 springs in both the unconsolidated and in the bedrock aquifers are recorded under the provisions of Montana water laws. Springs are of considerable importance in Montana for domestic, stock, municipal, and irrigation water. An important use of springs is shown by the location of fish hatcheries at several springs in the State. The quality of groundwater is generally excellent to good in western Montana, excellent to fair in central Montana, and good to poor in the eastern part of the state. (Woodard-USGS)

AVERAGE ENTITIES IN KINEMATICS AND THERMODYNAMICS OF POROUS MATERIALS,
Technion - Israel Inst. of Tech., Haifa. Lab. of Soil Science.
Dan Zaslavsky.
Soil Science, Vol 106, No 5, p 358-362, November 1968. 1 fig, 34 equations, 3 ref. P.L. 480.

Descriptors: *Porous media, *Thermodynamics, *Soil physics, *Groundwater movement, *Arid lands, Equations, Mathematical studies, Properties.
Identifiers: *Kinematics, *Continuum mechanics, *Media phases, *Soil-water relationships, Parameters, Fluxes.

Mathematical treatment of porous medium properties allows better utilization of ground-water--the primary water source for arid and semi-arid lands. A porous medium has these characteristics: (a) it consists of many different kinds of phases (homogeneous, heterogeneous, porous), some being fluid, partially fluid, or solid; (b) its different phases are spacially well distributed and (c) it can be treated as a continuum. The source of its heterogeneity may be in particles or portions of different size orders, ranging from molecules to geographic regions. The use of derivatives and integrals in the formulation of general laws for porous media requires the definition of properties which vary as a continuum. This approach has been implicit. This article develops the formulation of general laws systematically and explicitly. Definition of a continuum, averaging the parameters of contents, averaging the fluxes, the two-translated subsystem, average rotation, and the general form of average forces are discussed through 34 equations, in vector, integral, total and partial derivative form. Thermodynamic forces are also considered. (Popkin-Arizona)

2G. Water in Soils

ROOT EXPLORATION RATE: A NEW CONCEPT IN THE STUDY OF SOIL WATER REMOVAL BY PLANTS (IN FRENCH),
Oregon State Univ., Corvallis. Dept. of Soils.
L. W. De Backer, and L. Boersma.
In: Science du Sol - No 2, Supplement au Bulletin de l'Association Francaise pour l'Edude du Sol, p 3-20, 1968. 18 p, 8 fig, 6 tab, 4 ref. OWRR Project B-001-ORE (4).

Descriptors: *Moisture uptake, *Root zone, Moisture availability, Soil moisture, Soil moisture movement, Transpiration, Water utilization, Oak trees, Fir trees.
Identifiers: Root exploration rate (Plants).

From a plot of cumulative soil water uptakes by plants with depth over a period of time, a curve of the slopes of this cumulative function versus depth is obtained. Such a curve presents a maximum interpreted as being the depth of greatest root activity. From a series of such curves, it is possible to plot the advance of the maximum root activity zone during the soil water depletion cycle. The time rate of change of the maximum root activity depth defines the root exploration rate. Under the same climatic conditions, the root exploration rate of oaks was five times greater than that of douglas firs, whereas the soil water availability of the fir plot was about 2.5 times greater than that of the oak plot. Combining the water availability coefficient and the porosity of the soil with the root exploration rate, it is possible to establish the rate of water used by the plants. (Knapp-USGS)

French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 257-263, 1969. 7 p, 5 fig, 3 ref.

Descriptors: *Unsteady flow, *Water level fluctuations, *Bank storage, *Groundwater movement, *Surface-groundwater relationships, Filtration, Recharge, Water storage, Discharge (Water), Computer programs, Mapping, Mathematical studies.
Identifiers: *Unstable filtration.

Problems of unstable filtration of groundwater may be solved by conformal mapping, using numerical calculations on electronic computers. The problem of unstable filtration caused by water surface fluctuations in the adjoining reservoir, and the physical analogies of groundwater motion due to waves on infiltration near the gently sloping sea coast are examples presented. The potential nonstationary motion of groundwaters with a free surface occurs in the homogeneous material of infinite depth. (Knapp-USGS)

French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 239-246, 1969. 8 p, 2 fig, 1 tab, 5 ref.

Descriptors: *Drainage systems, *Soil water movement, Water levels, Mathematical studies, Water wells, Aquifers.
Identifiers: Non-uniform stratified soils.

Methods are given for calculation of flow to horizontal drains and incomplete vertical wells in two-layer and three-layer strata. These methods are the result of the strict solution of water inflow to horizontal drains and vertical wells in stratified soils. On the basis of these solutions practical methods have been worked out to be used for calculating water lowering, the capture of fresh and salt waters, or draining hydrotechnical structures. A formula for determining drain discharge per unit length and the yield of an incomplete well is also presented. (Knapp-USGS)

ANALYTICAL TREATMENT OF TWO-PHASE INFILTRATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Richard L. Brustkern, and Hubert J. Morel-Seytoux.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY12, Paper 7743, p 2535-2548, December 1970. 14 p, 10 fig, 8 ref, append.

Descriptors: *Unsaturated flow, *Computer programs, *Numerical analysis, *Infiltration, Soil moisture movement, Porous media, Capillary action.
Identifiers: *Multiphase flow.

An approximate analytical treatment for the problem of one-dimensional infiltration into a homogeneous porous medium is presented. Movement of both the air phase and the water phase is considered. The procedure assumes that capillary pressure can be neglected in the saturation equation, whereas it is retained in an integral equation for the unknown total flow. The two equations are solved in a step-wise manner to yield the saturation profile, and the infiltration rate at any time. Infiltration rate curves are obtained for a number of situations involving different boundary or initial conditions or both. Infiltration rate predictions are in good agreement with those predicted by a finite difference solution. This is quite promising in view of the fact that the computer costs are an order of magnitude less than by the finite difference technique. (Knapp-USGS)

SOIL CATENA CONCEPT FOR HYDROLOGIC INTERPRETATIONS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
S. L. Chiang, and G. W. Petersen.
Journal of Soil and Water Conservation, Vol 25, No 6, p 225-227, November-December 1970. 3 p, 3 tab, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Soil water movement, *Infiltration, *Soil physical properties, *Soil classifications, Soil groups, Soil investigations, Soil types, Hydrogeology, Surface-groundwater relationships.
Identifiers: Soil catenas, *Runoff-soil water relationships.

Understanding the relationship between soil characteristics and the behavior of runoff water is requisite to improved soil and water conservation. To effectively convey hydrologic soils information from soil scientists to non-soil scientists, an ideal soil catena diagram is proposed. This diagram relates parent material, texture, drainage, depth, and to some extent, the subsurface conditions of the soil. Soils of low runoff potential have high infiltration rates even when thoroughly wetted and consists chiefly of deep, well to excessively drained sands or gravels. Soils having moderate infiltration rates when thoroughly wetted are chiefly moderately deep to deep, moderately well to well-drained, with moderately fine to moderately coarse textures. Soils having slow infiltration rates when thoroughly wetted usually have a layer that impedes downward movement of water, or have moderately fine to fine texture. Soils of high runoff potential have very slow infiltration rates when thoroughly wetted and include clay soils with a high swelling potential, soils with a permanent high water table, soils with a claypan or clay layer at or near the surface, and shallow soils over nearly impervious material. NUMERICAL SOLUTIONS FOR THE RADICAL SUBSURFACE FLOW PROBLEM,
National Center for Atmospheric Research, Boulder, Colo. Atmospheric Science Lab.
Ronald L. Drake, and Michael B. Ellingson.
Groundwater, Vol 8, No 6, p 39-47, November-December 1970. 9 p, 6 fig, 2 tab, 7 ref.

Descriptors: *Soil water movement, *Numerical analysis, *Unsteady flow, *Unsaturated flow, *Diffusivity, Mathematical studies, Percolation, Subsurface flow.
Identifiers: *Radial subsurface flow.

Two stable finite difference schemes are presented for the numerical solution of the nonlinear partial differential equation describing the radial flow of soil moisture. The nonlinearity exists because soil moisture diffusivity is a nonconstant function of the nondimensional soil moisture. Numerical solutions are given for 21 different moisture-dependent diffusivities. From these numerical solutions quantitative results are obtained for the following: (1) the boundedness and monotonicity of the moisture distribution; (2) the continuous dependence of the moisture distribution on the system's parameter, namely, the diffusivity; (3) the rate at which the wetting front approaches the steady state solution; (4) the evolution of the moisture front with time and with the formulation of the diffusivity; and (5) the time evolution of the rate of inflow or outflow at the wall of the source or sink. BROWN STEPPE SOIL IN THE UPPER PART OF WADI EATEL (NORTHWEST TRIPOLITANIA),
Institute for Soil Research, Belgrade (Yugoslavia).
D. J. Filipovic, and M. Spasojevic.
Soil Science, Vol 106, No 2, p 131-135, August 1968. 4 tab, 4 ref.

Descriptors: *Soil surveys, *Soil physical properties, *Sierozems, *Agriculture, *Brown soils, Irrigation, Porous media, Soil chemical properties, Hydraulic conductivity, Loam, Porosity, Water quality, Arid lands, Cation exchange, Sands, Soil texture, Particle size, Darcys law, Soil density, Field capacity, Wilting point.
Identifiers: *Brown steppe soil, *Wadi Eatel (Northwest Tripolitania), *Libya, *Irrigation potential, Darcys coefficient, Bulk density, Cation exchange capacity.

About 8000 ha. of the Wadi Eatel in Northwest Tripolitania (Libya) is covered by brown steppe soil. The soil is sandy loam and loamy sand, formed on calcareous material consisting of three subvarieties. Sandy loam samples had respectively: porosity, Darcy coefficient, cation exchange capacity, and bulk density ranges of 47.80 to 52.00 volume percent, .00010 to .00045 K cm/sec, 8.76 to 13.83 meq/100g, and 1.39 to 1.43 g/ccm. Loamy sand samples showed porosity, Darcy coefficient, cation exchange capacity, and bulk density ranges of 44.00 to 48.10 volume percent, .00046 to .00640 K cm/sec, 7.35 to 14.00 meq/100g, and 1.37 to 1.46 g/ccm. A water sample taken in the upper part of the wadi showed high salinity (dissolved solids — 1302 ppm), and was suitable for supplemental winter irrigation on brown steppe soils. Chemical soil properties are favorable for agriculture. Mineral fertilizers would make more intensive soil utilization possible. Irrigation could become very useful where it can be provided. Tables present soild texture, chemical and physical properties, and water analyses. (Popkin-Arizona)

SOIL GEOGRAPHY AND FACTORS OF SOIL FORMATION IN AFGHANISTAN,
Wisconsin Univ., Madison. Dept. of Soil Science.
M. Zarif Salem, and Francis D. Hole.
Soil Science, Vol 107, No 4, p 289-295, April 1969. 6 fig, 17 ref.

Descriptors: *Soil formation, *Plant groupings, *Soil-water-plant relationships, *Soil profiles, *Arid lands, Sierozems, Grasslands, Climatic zones, Alluvium, Loam, Sands, Dunes, Deserts, Clays, Geographic regions, On-site observations, Precipitation (Atmospheric), Drainage patterns (Geologic).
Identifiers: *Soil geography, *Pedogenesis, *Phytogeographical provinces, *Afghanistan, Alluvial soil, Humic Gley soil, Low-latitude desert, Asiatic climatic system.

This study reports on field observations of 8 Afghanistan soil profiles, general information on soil geography and pedogenetic factors. Two are alluvial soils (Darweshan silty clay, or Typic Ustifluvent, and Shisham Bagh sandy loam, or Typic Ustifluvent), five are Desert soils (Kabul silt loam, or Mollic Haplargid, Nadi Ali sandy loam, or Typic Haplargid, Bost sandy loam, or Typic Haplargid, Alchin silt loam, or Typic Haplargid, and Abul Khail silt loam, or Typic Haplargid), and one a Humic Gley (Pozay Aishan silty clay, or Cumulic Argiaquoll). About 40 percent of the country is in arid wastelands. The topography consists of lowlands (sand dunes, salty marshes, playas), plains (sand dunes, desert flats, playas, broad river valleys), plateaus and uplands (marshlands and small lakes), and mountain ranges, high mountain ranges and peaks (mountain glaciers). Afghanistan is located in the low-latitude desert and steppe belt of the Asiatic climatic system. Six phytogeographical provinces are correlated with 8 climatic zones, where temperature, dryness index (evaporation/precipitation ratio), precipitation and wind are important. Maps of topography, soil, drainage, climatic types, and phytogeography and representative soil profile section are included. (Popkin-Arizona)

GILGAI IN THE QUATERNARY,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia).
E. G. Hallsworth, and G. G. Beckmann.
Soil Science, Vol 107, No 6, p 409-420, June 1969. 1 tab, 2 fig, 36 ref.

Descriptors: *Soil physical properties, *Soil physics, *Quaternary period, *Hydraulic conductivity, *Arid lands, Wetting, Particle size, Plasticity, Paleohydrology, Paleoclimatology, Soil profiles, Soil groups, Geomorphology, Cracking, Geologic formations, Montmorillonite, Drying, Data collections.
Identifiers: *Soil micromorphology, *Gilgai phenomena, *Gilgai classification, *Australia, *Swelling profile, Layering, Paleogeography.

An account is given of data on soil, showing the gilgai phenomena and presenting analyses of factors responsible for the different forms. Attention is given to possible relationships between gilgai and Quaternary history. Gilgai is applied to describe the surface micromorphological phenomena of alternate hummocks and hollows of soils beyond periglacial areas. The phenomena is widespread in Australia. Gilgai forms are classified as normal (round), melon-hole, lattice, linear (wavy), tank, and stony. The surface soil material of the mounds is related to and continuous with the subsoil of the depressions. Gilgai soils are predominantly montmorillonitic. Micromorphology suggests that gilgai soils are sedimentary in origin and show layering. Magnitude and pattern of the gilgai, formed by soil cracks on drying and wetting, are results of swelling profile, size of soil aggregates, wetting cycle, hydraulic conductivity profile and plasticity profile. The gilgai are a clue to paleoclimate, paleohydrology and paleogeography. Analytical data for gilgai in Australia, South Dakota and Katanga are tabulated. Figures of gilgai types and a cross section of a depression are included. (Popkin-Arizona)

EFFECT OF TEMPERATURE AND pH ON SODIUM TRANSLOCATION AND SODIUM EXCHANGE REACTIONS IN BUSH BEANS,
California Univ., Los Angeles.
Arthur Wallace.
Soil Science, Vol 106, No 2, p 144-148, August 1968. 9 tab, 12 ref. NSF Grant No 3683.

Descriptors: *Temperature, *Acidity, *Translocation, *Sodium, *Soil-water-plant relationships, Ammonium salts, Carbon dioxide, Root systems, Beans, Hydrogen ion concentration, Plant physiology, Aeration, Salts, Damages, Cation exchange.
Identifiers: *Bush beans, *Sodium exchange reactions, Milk acid, Plant injury.

Bush beans (Phaselus vulgaris var. Improved Tendergreen) were studied for sodium translocation effects to determine information concerning poor translocation of sodium to shoots. Temperatures up to 70 degrees C for short time periods greatly increased sodium translocation without killing the plants, but new roots were generated. Growing plants in nutrient solutions at 43 degrees C for 14 days injured plants and resulted in increased sodium translocation. Ammonium sulfate solutions at 10 to the minus 3 M resulted in enough acidity to increase sodium translocation to stems. The ammonium ion and CO sub 2 aeration caused sodium exchange or leakage. Milk acid treatments did not severely injure bean plants, but resulted in sodium translocation. Root sodium was not subject to exchange with potassium or calcium but was exchanged in 24 hours by external solution sodium indicating that translocation failure is not due to the sodium being chemically bound. Tables show temperature, ammonium sulfate, treatment, CO sub 2 aeration, acid and base treatment, and salt treatment effects. (Popkin-Arizona)

PROBLEMS OF DETERMINATION OF SOIL DENSITY AND MOISTURE PROPERTIES FROM NATURAL CLODS,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Soils.
D. S. McIntyre, and J. Loveday.
Soil Science, Vol 105, No 4, p 232-236, April 1968. 1 tab, 4 fig, 12 ref.

Descriptors: *Soil moisture, *Soil density, *Moisture content, *Soil pressure, *Wetting, Loam, Clays, Sampling.
Identifiers: *Natural clods, *Soil suction, *Bulk density.

This paper compares soil density and moisture measurements made on small clods equilibrated at a known suction with those determined from cores taken 24 to 30 hours after wetting. Specimens were taken on a range of soils, from loamy sands to cracking clays. Bulk density and moisture properties depended on the rate of wetting of the air-dry clods. Rapid wetting decreases the bulk density of clayey soils and increases the moisture retained throughout the suction range 50 to 600 cm. Recommended sampling includes use of large samples and sampling under moist conditions. Large volume clods are preferred if clods must be sampled. Wetting of clods should be carried out slowly beginning at suctions greater than 30 cm water. Figures are presented of the difference between 100 cm moisture percentages of clods at various wetting rates, bulk density versus wetting rates, core bulk density and moisture versus wetting rate, and extended time of measurement after wetting. DETERMINING WATER CONTENT OF DIFFERENT SOILS BY THE NEUTRON METHOD,
Agricultural Research Service, Riverside, Calif. Soil and Water Conservation Research Div.
R. E. Luebs, M. J. Brown, and A. E. Laag.
Soil Science, Vol 106, No 3, p 207-212, September 1968. 2 tab, 4 fig, 8 ref.

Descriptors: *Soil moisture meters, *Soil moisture, *Bulk density, *Instrumentation, *Calibrations, Soil physics, Moisture content, Nuclear meters, Depth, Volumetric analysis, Measurement, Soil types.
Identifiers: *Neutron method, *Neutron count rate, *Soil-water relationships.

Advantages which account for wide acceptance of the neutron method for determining soil water content include greater precision, rapidity of measurements, large volume measured and full range of soil water. Count rate and soil water content below the 30-cm depth differed for several soils. Observed maximum difference was equivalent to 4.4 per cent water by volume; curve slopes were similar for investigated soils. Higher count rates were associated with higher bulk density. The most accurate determinations by the neutron method require calibration of bulk density changes. A high linear correlation between count rate and soil water content was obtained for the 0- to 15- cm layer. Repeated determinations of soil water content in the undisturbed 0- to 15-cm layer can be obtained by calibrating for the particular soil and controlling depth of measurement. Tables show percentage of count rate variation with soil water content and count rate determined from calculated regression on volumetric water content. Figures show neutron calibration curves for two depth ranges, and effect of bulk density on counting rate and soil water content. (Popkin-Arizona)

D. Karmeli, and I. Ravina.
Soil Science, Vol 105, No 4, p 209-215, April 1968. 1 tab, 5 fig, 6 ref.

Descriptors: *Soil chemistry, *Soil physics, *Aeolian soils, *Sands, *Clays, Dunes, Cation exchange, Soil properties, X-ray analysis, Soil mechanics, Potassium, Loam, Fine-textured soils, Expansive soils, Electrophoresis.
Identifiers: *Israel, *Hamra soil association, *Cation-exchange capacity (CEC), *Soil-water relationships, Fractions, Electrophoretic mobility.

Hamra soils of Israel were found to consist of two main fractions: sand and clay. The clay--of eolian origin--is added to dune sands to form various soil types. Clay fraction properties are identical, irrespective of content and location. Cation exchange capacity (CEC), internal surface area, free swell properties, electrophoretic mobility, X-ray diffraction analyses, total potassium, chemical and mechanical analyses, and composition of the exchangeable cation complex are discussed. The table of results relates sand, sandy loam, sandy clay loam, sandy Nazaz, grey Nazaz, and black Nazaz to

14 chemical and physical properties. Figures of CEC as a fraction of fine content, frequency distribution of electrophoretic mobilities, X-ray diffractograms, and mechanical analyses are presented. (Popkin-Arizona)

BOTTOM STABILITY AND SEDIMENTARY PROCESSES AT LITTLE LAKE HARBOR, LAKE SUPERIOR,
United States Lake Survey, Detroit, Mich.
James H. Saylor, and Sam B. Upchurch.
Available from NTIS as AD-712 300, $3.00 in paper copy, $0.95 in microfiche. Research Report No 2-1, August 1970. 60 p, 38 fig, 1 tab, 21 ref.
Identifiers: *Sedimentation, Dissemination, *Harbors, Construction, *Marine engineering, Great Lakes, Mass transfer, Stability, Breakwaters, Sand, Gravel, Maintenance, Shallow water, Lake Superior, Littoral drift, *Harbor bottom stability, *Lacustrine environment, Shore protection.

The report discusses the relationship of littoral drift to sediment texture and fluctuations in offshore and strandline topography at Little Lake in southeastern Lake Superior. Offshore bars and troughs oscillate about a mean position, depending on the direction and intensity of wave attack. In contrast to the offshore bars and troughs, shallow-water topographic features migrate normal to and along shore with changes in lake level and wave attack. Sediment consists of two distinct populations: pebble-cobble and sand. The pebble-cobble population is relatively immobile and serves as an armor for the beach and nearshore. The sand population is highly mobile and its distribution reveals the effect of the harbor breakwaters on littoral drift. Littoral drift causes harbor maintenance problems, including shoaling in the harbor mouth and beach deterioration adjacent to the breakwaters. A primary cause of the shoaling is entrapment of a portion of the sand fraction bypassing the harbor structures by circulation patterns induced by harbor design.

GENERAL SCHEME FOR CALCULATING THE WATER BALANCE OF CLOSED INLAND SEAS AND LAKES BY THE METHOD OF STATISTICAL MODELLING,
Georgian Power Research Inst., Tiflis (USSR).
G. G. Svanidze, and I. B. Khomeriki.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 289-294, July 1970. 6 p, 2 fig, 1 tab, 15 ref.

Descriptors: *Water balance, *Statistical models, *Lakes, Equations, Reviews, Hydrologic cycle, Synoptic analysis, Hydrologic budget, Meteorology, Precipitation (Atmospheric), Runoff, Evaporation, Water storage, International Hydrological Decade.
Identifiers: *USSR, *Closed inland seas.

In arid regions, where evaporation from the water surface exceeds rainfall, there are, in closed basins, bodies of water without outflow. To such bodies of water in the USSR belong the Caspian and Aral seas, the Balkhash and Issyk-Kul lakes and a number of lesser lakes. The variability of water balance of such water bodies entails variations of water level which affect various branches of the economy (navigation, fishing, mining, agricultural utilization of coastal lands, resort economy, etc). In this report pertinent literature is reviewed from which a method is applied to a statistical model for water balance computations on a digital computer. (Woodard-USGS)
W71-02461

STORAGE IN THE WATER BALANCE OF THE LAKE ONTARIO BASIN,
Department of Energy, Mines and Resources, Cornwall (Ontario). Inland Waters Branch.
D. F. Witherspoon.
In: Symposium on World Water Balance, Vol 2, International Association of Scientific Hydrology Publication No 93, p 283-288, July 1970. 6 p, 2 fig, 4 ref.

Descriptors: *Water balance, *Water storage, *Lake Ontario, *Basins, Hydrologic cycle, Model studies, Equations, Meteorology, Synoptic analysis, Precipitation (Atmospheric), Evaporation, Runoff, Streamflow, Solar radiation, Soil moisture, Soil water movement, Water storage, Groundwater, Surface waters, Vegetation, International Hydrological Decade.

Using a hydrologic model based on the water balance, the annual run of storage and its extremes are studied to determine the significance of this factor in the balance of a large land basin of 27,100 square miles which contributes to the local inflow of Lake Ontario. Estimates obtained are reasonable when compared with values estimated from the physical and hydrologic characteristics of the basin. These estimates demonstrate the relative importance of storage to the month by month hydrology of the basin. The storage on the basin is approximately equivalent in volume to that available within the range of stage of Lake Ontario allowable by international agreement between Canada and the United States. PHOSPHATE EXCHANGE WITH SEDIMENTS: ITS ROLE IN THE PRODUCTIVITY OF SURFACE WATERS,
Harvard Univ., Cambridge, Mass.
W. Stumm, and J. O. Leckie.
Fifth International Water Pollution Research Conference, San Francisco, July 26-August 2, 1970. Preprint. 16 p, 11 fig, 36 ref.

Descriptors: *Phosphates, *Sediments, *Lakes, Primary productivity, Sediment-water interfaces, Oxygenation, Iron, Aluminum, Calcium, Dredging, Solubility, Kinetics.
Identifiers: Redox potential, Lake Constance, Lake Zurich, Lake Norrviken, Bering Sea.

The availability of phosphorus to algae present in surface waters is a composite function of the supply of total phosphorus in the water basin, release of phosphorus from sediments, regeneration from biota and detritus, and transport processes. The release of phosphates from sediments to epilimnion depends primarily on their diffusion through the interstitial water. For an undisturbed sediment-water interface a maximum phosphorus transfer of 0.000009 mole/ sq meter per day may be estimated. In many cases reactions with iron, aluminum, and calcium immobilize considerable quantities of phosphorus in insoluble form. Various solution parameters induce crystal growth of apatite, the process particularly enhanced in the presence of fluorite. The removal of sediments by dredging may release a large supply of nutrients into water, cause disturbance between benthos and plankton, and lower the buffer capacity of the lake and its resistance to external changes. Identifiers: *Seedlings, *Phytochromes, *Temperature effects, Israel, Negev Desert.

Atriplex dimorphostegia is a Negev Desert plant with 'humped' and 'flat' seed dispersal unit varieties. A percentage of the seeds germinate in the dark at an optimal temperature of 10 deg C. The non-germinating fraction can be induced to germinate by short irradiation with white light. Continuous irradiation is not only ineffective but also inhibits the dark-germination fraction. With photoperiodic irradiation, increasing light/dark ratios resulted in decreasing germination percentages. Germination was promoted by light in the red and inhibited by the far red, indicating that irradiation effects are mediated by phytochromes. The promotive effect of short irradiation is prevented if preceded or followed by long irradiation. Seeds pretreated in darkness at supra-optimal temperature or subjected to water stress were strongly stimulated by short irradiation. Both treatments lessened the inhibitory effects of long irradiation. It is thought that high temperature not only causes promotive phytochrome formation but also interrupts some metabolic pathway resulting in partial inhibition of the phytochrome system. Since they produce synergistic effects on germination, water-stress probably acts to mask the metabolic interruption caused by supra-optimal temperatures. In all cases the 'humped' seeds were more susceptible to inhibitory treatments and less susceptible to promotive treatments. (Casey-Arizona)

THE CATIONS OF THE COTTON PLANT IN SODIUM SUBSTITUTED POTASSIUM DEFICIENCY,
Texas Agricultural Experiment Station, College Station.
J. V. Amin, and H. E. Joham.
Soil Science, Vol 105, No 4, p 248-254, April 1968. 4 tab, 10 ref.

Descriptors: *Cotton, *Potassium, *Sodium, *Cation exchange, *Soil-plant-water relationships, Solubility, Calcium, Leaves, Plant tissues, Root systems, Nutrient requirements, Proteins, Crop response.
Identifiers: *Potassium deficiency, *Sodium substitution, *Synergistic action, Stems.

Cotton plant cations were studied under conditions of adequate, partially-substituted (Na for K), and deficient potassium nutrition by dividing cations into alcohol soluble and insoluble fractions. The solubility order was: K greater than Na greater than Ca. Potassium deficiency increased the insoluble K/soluble K ratio of the leaves. Increased potassium mobility, increased K absorption and change in K phase distribution in the presence of Na are involved in Na substitution for K in cotton plant nutrition. Substrate Na addition increased Ca in both soluble and insoluble phases. In the range of K substitution, constancy of cations is maintained by synergistic action between Na and other plant cations, including K. Tables show total and percent soluble K, Na, Ca, and protein content as influenced by various K and Na treatments with time. (Popkin-Arizona)

DROUGHT RESISTANCE OF CYPRESS AND THUYA BRANCHLETS,
Hebrew Univ., Jerusalem (Israel). Dept. of Plant Physiology.
H. R. Oppenheimer.
Israel Journal of Botany, Vol 19, No 2, p 418-428, 1970. 5 fig, 2 tab, 13 ref.

Descriptors: *Plant morphology, *Transpiration, *Xerophytes, *Coniferous trees, *Drought resistance, Stomata, Moisture stress, Leaves, Plant physiology, Plant groupings, Plant tissues, Vascular tissues, Mode of action, Environmental effects, Laboratory tests, Epidermis, Saturation, Water loss, Water conservation, Regulated flow, Physiological ecology, Drought tolerance, Dehydration, Moisture deficit.
Identifiers: *Cypress trees, *Leaf scales, *Water saturation deficits, *Ramilli, *Hydrophobic properties.

Isolated branchlets (ramilli) of 3 xerophytic Cupressaceae species, Cupressus sempervirens, C. glabra and Thuja orientalis, were investigated to determine their absolute and relative drought resistance capabilities. Leaf tissue morphology studies showed that all had imbricate scales, cutin layers overlaying the epidermis and infrequent stomata. Thuja had relatively less imbrication, spongier scale inner structure, thinner cutin, more Ca oxalate and more frequent stomata on unprotected leaf areas. Two aspects never before seen in the cypresses were stomatal concentrations in the protected grooves between the scales and presence of cutinous papillae. Transpiration, calculated as losses of initial weight/hr, was low and extremely variable in all 3 species. During desiccation, vital staining studies indicated inner tissue death in all species occurred only when water losses reached 50% of water content at saturation (WSD) while primary meristems, bundle elements and epidermis were even more resistant, demonstrating a high drought tolerance. Of the 3, Thuja proved the most drought tolerant, probably because of better stomatal regulation and a more efficient cuticle. Stomatal arrangements indicate a 'trickling' type of transpiration with positive and zero phases. The physiological behavior of these species appears to correlate well with their geographical and ecological distributions. (Casey-Arizona)

Identifiers: *Polysomes, *Seedlings, *DNA, *Messenger RNA, Incorporation, Ribosomes.

Relatively mild plant water stresses affect cell nuclei by inducing chromatin aggregation and polysome disappearance. Determinations of ribosome structure and amino acid uptake and incorporation were made on water stressed root tip cells. Sedimentation analyses of ribosome isolates showed that polysome fractions decreased to 8% in stressed tips relative to controls. These results were supported by electron-micrographs in which stressed root cells had no polysomes. Carbon-14 labelled amino acid uptake and incorporation into trichloroacetic acid was severely reduced in both water stressed intact seedlings and root tips. On the basis of these findings, a possible hypothesis of the underlying effects of water stress on root tip cell function is advanced: cellular dehydration causes nuclear DNA condensation, thereby decreasing m RNA synthesis. The extent of both phenomena is directly proportional to degree of water loss. Decreasing m RNA results in decreasing protoplasmic polysome populations thus reducing protein formation and producing various drought symptoms. Recovery on rehydration is dependent on the extent of damage during stress. (Casey-Arizona)

INFLUENCE OF SOIL TEMPERATURE, IRRIGATION AND AERATION ON HEMICYCLIOPHORA ARENARIA,
California Univ., Riverside.
S. D. Van Gundy, F. D. McElroy, A. F. Cooper, and L. H. Stolzy.
Soil Science, Vol 106, No 4, p 270-274, October 1968. 2 tab, 3 fig, 7 ref. NSF Grant GB-2394.

Descriptors: *Soil temperature, *Irrigation effects, *Aeration, *Nematodes, *Pest control, Citrus fruits, Vegetable crops, Soil-water-plant relationships, Arid lands, California, Sampling, Depth, Reproduction, Life cycles, On-site tests, Greenhouses, Environmental effects, Animal populations, Oxygen, Drying, Rates of application, Diffusion.
Identifiers: *Sheath nematode, *Soil suction, Coachella Valley (California), Imperial Valley (California).

The sheath nematode, Hemicycliophora arenaria Raski, is a relatively new nematode pest to California citrus. It is a native species found on an indigenous plant common in sandy washes and stream beds in the Coachella and Imperial Valleys--cheese bush. It parasitizes vegetable crops in greenhouse experiments, and under optimum conditions of 30 to 32.4 degrees C. and sandy soils, can produce large populations in 3 months. Increased frequency and amount of water application in field and greenhouse tests reduced population numbers of the nematode irrespective of soil temperatures. Oxygen diffusion rate measurements demonstrated that a drying period of 7 days between irrigations was required before there was relatively high and uniform oxygen distribution throughout the top 24 inches of soil. The interval of time between short cycle irrigations did not allow sufficient oxygen diffusion to the lower depths for growth of citrus roots and nematode reproduction. At shallow depths, the frequency interruption of nematode life cycle with 3-day irrigations had some influence on total nematode reproduction. Tables show nematode populations taken at monthly intervals in field soil, and effect of temperature and soil suction on nematode reproduction. Figures of monthly population density and days between irrigation, oxygen diffusion rates and relationship to irrigation frequency are included. (Popkin-Arizona)

FUNCTION AND GROSS MORPHOLOGY IN FISH,
National Science Foundation, Washington, D.C. Special Foreign Currency Science Information Program.
Yu. G. Alecv.
Available from NTIS as TT-67-51391, $3.00 in paper copy, $0.95 in microfiche. Funnktsional'nye Osnovy Vneshnego Stroyen'ya Ryby. Israel Program for Scientific Translations, Jerusalem, 1969. 267 p.
Identifiers: *Fishes, *Morphology (Biology), *Physiology, Fishes, Sense organs, Adaptation (Physiology), Gravity, Motor reactions, Embryology, Nutrition, USSR, Ontogeny, Phylogeny.

The book represents a comprehensive approach in reviewing factors determining the outer organization of fish and deals also with the basic features involved with the dynamics of this organization in the course of ontogeny and phylogeny; the author analyzes the adaptations connected with the animal's movements, its disguise and protection, its catching of food and the provision of the normal function of the animal's sense organ receptors. Special attention is devoted to the review of adaptations associated with movements of the animal owing to the fact that the latter mostly display a most effective influence upon the exterior structure of fish; it is worth mentioning that these factors are examined insufficiently. The greater part of the author's original investigations is devoted to the study of these very complex adaptations. The study also covers adaptations connected with the animal's disguise. The significance of the latter phenomena has not been given adequate elucida-

tion and has not been viewed as factors determining the exterior structure of fish.

SEDIMENT MEASUREMENT TECHNIQUES: RESERVOIR DEPOSITS,

ASCE Proceedings, Journal of the Hydraulics Division, Vito A. Vanoni, Chairman, Task Comm., Vol 96, No HY12, Paper 7781, p 2417-2446, December 1970. 30 p, 25 fig, 1 tab, 19 ref.

Descriptors: *Sedimentology, *Surveys, *Measurement, *Sampling, *Instrumentation, Sediment transport, Data collections, Sediments, Sounding, Acoustics, Nuclear meters, Reservoir silting.
Identifiers: *Sedimentation manual (ASCE).

A chapter on reservoir deposits was written for the ASCE Sedimentation Manual. Reservoir sediment surveys are defined. Guidelines are listed concerning how frequently the surveys should be run. Field equipment is described including sonic sounders; distance measuring apparatus, and auxiliary equipment. Piston core, gravity type, gamma probe, and other types of sediment deposit samplers are illustrated and described. Contour and range methods of reservoir sediment surveys are explained. Several methods of reservoir capacity computations are presented mathematically and graphically. (Knapp-USGS)

MOTION OF SINGLE PARTICLES IN ALLUVIAL CHANNELS,
Geological Survey, Fort Collins, Colo.
Neil S. Grigg.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY12, Paper 7770, p 2501-2518, December 1970. 18 p, 12 fig, 4 tab, 8 ref, append.

Descriptors: *Sediment transport, *Tracking techniques, *Alluvial channels, *Hydraulic models, Radioactivity techniques, Tracers, Stochastic processes, Dispersion, Erosion, Sedimentation.
Identifiers: Single-particle tracking.

Movements of single sand-size radioactive particles were followed in a laboratory alluvial channel. Two sizes of bed material were used with experimental conditions limited to the ripple and dune bed forms of the lower flow regime. The frequency distribution of the particle step lengths was represented very well by the gamma distribution, and the frequency distribution of the particle rest periods was represented adequately by the exponential distribution. The mean step lengths related well to the stream power of the flow. The mean rest period related well to the celerity of the bed forms. A one-dimensional stochastic model for sediment dispersion predicted the mean distance traveled by the tracer particles but did not predict the rate of spreading of the tracer concentration distribution. (Knapp-USGS)

SEDIMENTS AND SEDIMENTARY PROCESSES OF EASTERN MISSISSIPPI CONE, GULF OF MEXICO,
Florida State Univ., Tallahassee. Dept. of Geology and Florida State Univ., Tallahassee. Dept. of Oceanography.
Ter-Chien Huang, and H. G. Goodell.
American Association of Petroleum Geologists Bulletin, Vol 54, No 11, p 2070-2100, November 1970. 31 p, 11 fig, 5 tab, 15 ref.

Descriptors: *Sedimentation, *Gulf of Mexico, *Mississippi River, *Deltas, Sedimentary structures, Water chemistry, Geochemistry, Sediments, Suspended load, Bed load, Instrumentation, Surveys, Sands, Silts, Mud, Carbonate rocks, Geophysics, Profiles, Sounding, Sediment transport, Turbidity currents, Deposition (Sediments).
Identifiers: *Mississippi Delta, Mississippi cone.

The upper 6-7 m of sediment of the eastern Mississippi cone consists of gray silt and silty clay intercalated with a few layers of fine sand, topped by a 20-50-cm layer of yellowish-brown foraminiferal clay. Dating shows that the lower silty layers, which are the deposits of latest low sea-level stand, were deposited more rapidly than the upper foraminiferal clay. Sedimentation rates, which depend primarily on the rate of the detrital influx and sea-level change, average about 30 cm/1,000 years. The primary mechanisms of sediment transport are differential pelagic settling and low-flow-regime bottom currents, with many mass movements by sliding or slumping. Most of the structures associated with coarser materials are similar to structures formed by traction transport or by ripple migration in shallow water. Diagenetic solution of carbonate, is related to the degradation of organic matter. Solution is partly responsible for the abrupt decrease of carbonate downward, rearrangement of clay particles into secondary thin laminae, and the shortening of the distance between silt and sand layers. MUD VOLCANO CLAY, TRINIDAD, WEST INDIES,
Columbia Univ., New York. Dept. of Geology.
Paul F. Kerr, Isabella M. Drew, and Darlene S. Richardson.
American Association of Petroleum Geologists Bulletin, Vol 54, No 11, p 2101-2110, November 1970. 10 p, 7 fig, 3 tab, 29 ref.

Descriptors: *Sediment transport, *Sedimentary structures, *Structural geology, *Clays, *Quick clays, Sedimentation, Clay minerals, Mud, Volcanoes, Flow, Mudflows.
Identifiers: *Mud volcanoes, *Trinidad (W.I.), *Thixotropic clays.

Clay-mineral samples from two mud volcanoes on the island of Trinidad were compared with clay samples from the lower Cruse and Nariva Formations, through which the throats of the mud volcanoes are believed to have penetrated. The clay minerals are mixed-layer illite-montmorillonite and kaolinite. In the formation samples, illite is the larger part of the mixed-layer clay. Montmorillonite is preponderant in the clay from the mud volcanoes. All the clay samples examined, when water saturated, become thixotropic with the capacity to flow as a fluid. Thixotropic clay saturated with water becomes a highly mobile fluid with great transporting power. Where such a mobile mass accumulates along a partly broken anticlinal structure, any release of pressure will occur upward. A gas pocket, tectonic squeeze, or both will provide pressure to maintain upward motion. In this way the clay is extruded to form a mud volcano. Although moving vertically and supported by gas and tectonic pressure, the clay flowage has characteristics comparable to horizontal clay movement in landslides, in which motion is maintained by gravity. MECHANICS OF DEBRIS AVALANCHING IN SHALLOW TILL SOILS OF SOUTHEAST ALASKA,
Forest Service (USDA), Juneau, Alaska. Pacific Northwest Forest and Range Experiment Station.
Douglas N. Swanston.
USDA Forest Service Research Paper PNW-103, 1970. 17 p, 8 fig.

Descriptors: *Debris avalanches, *Landslides, *Mass wasting, *Glacial soils, *Slope stability, Soil erosion, Engineering geology, Soil engineering, Alaska, Clear-cutting.
Identifiers: Southeast Alaska, Soil creep.

Three areas with recent debris avalanches in a shallow, permeable till soil common to southeast Alaska were instrumented and analyzed using established methods of soil mechanics. These studies indicated that a combination of complete saturation during periods of excessive rainfall, naturally unstable slopes (S34 deg.), and the loss of the anchoring effect of tree roots in an otherwise cohesionless soil were the principal causes of the debris avalanching. Areas of general slope instability in a watershed can be located by constructing an isosinal contour map. The critical contour in the study area was 0.6, the sine of 37 deg.

THE DISTRIBUTION OF Pb, Ag, Sn, Tl, AND Zn IN SEDIMENTS ON ACTIVE OCEANIC RIDGES,
Miami Univ., Fla. Inst. of Marine and Atmospheric Sciences.
Arthur Horowitz.
Marine Geology, Vol 9, No 4, p 241-259, November 1970. 19 p, 5 fig, 7 tab, 30 ref.

Descriptors: *Water chemistry, *Geochemistry, *Sediments, *Distribution patterns, *Oceans, *Sea water, Sedimentation, Oceanography, Marine geology, Topography, Geophysics, Sedimentation rates, Deposition (Sediments), Movement, Sediment distribution.
Identifiers: *Ocean ridges, Tectonic activity.

Ninety-five sediment samples, taken from traverses across active oceanic ridges were analyzed by emission spectrography for Pb, Ag, Sn, Tl, and Zn. The concentration patterns indicate that processes associated with active oceanic ridges partially affect the distribution of Pb, Tl and Zn. The distribution of Ag is affected only in the Pacific and western Indian Ocean. Sn distribution is not related to any active ridge process. The covariation between distance from a ridge and concentration indicates that the ridge effects are not more than 10%. Average concentrations (weighted by sedimentation rates) were determined for Pb, Ag, Sn, Tl, and Zn in parts of the Pacific, the Atlantic, and the Indian Oceans. On the basis of the high concentrations of Pb, Tl, and Zn in the Pacific, the intermediate concentrations in the Indian Ocean, and the low concentrations in the Atlantic, it is inferred that the East Pacific-Antarctic Ridge system is the most active, the north Mid-Atlantic Ridge is the least active, and the Indian Ocean Ridge system is of intermediate activity. This seems to be in accord with geophysical data for the same regions. (Knapp-USGS)

WATER RESOURCES DATA FOR COLORADO-1968: PART 2. WATER QUALITY RECORDS.
Geological Survey, Denver, Colo. Water Resources Div.

Report available from District Chief, Water Resources Div., US Gelogical Survey, Denver Federal Center, Denver, Colo. 80225. Geological Survey Duplicated Basic Data Report, 1969. 97 p, 3 fig, 21 ref.

Descriptors: *Water quality, *Data collections, *Surface waters, *Groundwater, *Colorado, Chemical, analysis, Gaging stations, Streams, Streamflow, Discharge measurement, Sediments, Temperature.
Identifiers: *Basic data, Water quality records.

Water quality data for surface waters in Colorado for the 1968 water year (October 1, 1967 to September 30, 1968) are presented. Data for a few water quality stations in bordering states and selected data on the chemical quality of groundwater in Colorado are also included. Water quality information is presented for chemical quality, fluvial sediment, and water temperatures. The chemical quality includes concentrations of individual dissolved constituents and certain properties or characteristics such as hardness, sodium-adsorption-ratio, specific conductance, and pH. Fluvial sediment information is given for suspended-sediment discharges and concentrations and for particle size distribution of suspended sediment and bed material. Water temperature data represent once-daily observations except for stations where a continuous temperature recorder furnishes information from which daily minimums and maximums are obtained. Of the 100 Irrigation Network stations selected in 1952 (Water Resources Council), 77 are currently operated and the results are published in this report. The stations are at or near certain streamflow gaging sites west of the main stem, Mississippi River. These data are for evaluation of chemical quality of applied water and the quality changes resulting from drainage of irrigated lands. Detailed definitions are given of technical terminology used in the report. (Woodard-USGS)

GROWTH PATTERNS OF DEEP-SEA FANS,
Scripps Institution of Oceanography, San Diego, Calif. Marine Physical Lab.
William R. Normark.
American Association Petroleum Geologists Bulletin, Vol 54, No 11, p 2170-2195, November 1970. 26 p, 25 fig, 2 tab, 46 ref.

Descriptors: *Sedimentation, *Deltas, *Sedimentary structures, *California, Pacific Ocean, Channel morphology, Deposition (Sediments), Sediment transport, Turbidity currents, Continental slope, Surveys, Sounding, Profiles.
Identifiers: *Deep-sea fans.

Mapping of La Jolla and San Lucas deep sea fans, off California and Baja California, with the deep-towed instrument package developed at Marine Physical Laboratory of the Scripps Institution of Oceanography details the fine-scale morphology, structure, and internal fill of the fan-valleys and suggests the growth patterns of these fans. A model for deep-sea fan growth based on this study predicts that deposition on a fan will be localized in a suprafan at the end of large, leveed valleys commonly found on, and generally confined to, the upper reaches of deep-sea fans. The suprafan normally is on the midfan and is characterized by numerous smaller distributary channels. Rapid aggradation in the suprafan coupled with migration and meandering of the channels produces a surface marked by isolated depressions or channel remnants. Uniform deposition, producing a symmetrical half-cone morphology, results from the shifting through time of fan-valleys across the area of the fan. (Knapp-USGS)

ABOVE-BOTTOM ACOUSTIC REFLECTIONS, MISSISSIPPI RIVER DELTA,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
L. D. Wright.
American Association of Petroleum Geologists Bulletin, Vol 54, No 11, p 2208-2213, November 1970. 6 p, 3 fig, 1 tab, 15 ref. ONR Project Nonr 1575 (03), Task No 388002.

Descriptors: *Sounding, *Salinity, *Mississippi River, *Density stratification, Stratified flow, Density currents, Tides, Flow, Tidal effects, Deltas, Surveys, Currents (Water), Water circulation, Acoustics, Bathymetry, Fathometers.
Identifiers: *Mississippi delta.

Acoustic fathometric reflections from depths well above the bottom are phenomena commonly observed off the passes of the Mississippi River. These reflections previously have been attributed to an ooze resulting from flocculation. Systematic observations failed to disclose the presence of the ooze or 'sludge' but indicated that the reflections result from strong salinity contrasts. The degree of these contrasts and the presence of the reflections are correlative with the direction of tidal flow. (Knapp-USGS)

EFFECT OF DIAPIRISM ON SEDIMENTATION IN GULF OF MEXICO,
Naval Oceanographic Office, Washington, D.C. Oceanography and Geophysics Branch.
Jack R. Walker, and H. Robert Ensminger.
American Association of Petroleum Geologists Bulletin, Vol 54, No 11, p 2058-2069, November 1970. 12 p, 13 fig, 1 tab, 4 ref.

Descriptors: *Sedimentation, *Structural geology, *Gulf of Mexico, *Geophysics, *Seismic studies, Profiles, Mapping, Instrumentation, Data collections, Sounding, Oil fields, Sea water, Velocity, Deposition (Sediments).
Identifiers: *Diapirism, *Salt domes.

In 1969 an extensive geophysical investigation was made of the Gulf of Mexico. One of the principal measurement systems used was the medium-frequency (3,500 Hz), high-resolution seismic profiler. The seismic profiles provide information about the effects on recent sediments of deposition, water-energy levels, and diapirism. The various stages of sediment deformation and disruption associated with active diapirism and of faulting resulting from salt dome emplacement are observable. The medium-frequency seismic system is a useful tool to aid the study of concurrent deposition during active diapirism and the subsequent environmental effects at the sea floor. Marine sediments that accumulate above an active diapir are profoundly affected by the distortion of the sea floor induced by growing salt intrusions. The accumulation of sediments above diapirs also is related directly to the rate of sediment influx and the energy level of the water. (Knapp-USGS)

NATIONAL ESTUARY STUDY --- VOLUME 1. MAIN REPORT.
Fish and Wildlife Service, Washington, D.C.

For sale by Superintendent of Documents, U S Government Printing Office, Wash, D C 20402 - Price $1.75. House Document No 91-274, 91st Congress, 2d Session, January 1970. 91 p, 16 photo, 11 map.

Descriptors: *Estuaries, *Water pollution effects, *Estuarine environment, *Management, Marsh management, Wildlife management, Habitat improvement, Recreation facilities, Industrial wastes, Planning, Legal aspects, State governments, Regulations, Preservation, Great Lakes, Coastal marshes, Investigations, Water rights, National seashores.
Identifiers: *Estuary P rotection Act, *National estuary study, Land-water interface, Coastal management system.

This is the main report of a 7 vol series prepared by the Department of the Interior in response to the Estuary Protection Act (PL 90-454). Report documents estuary importance and the severity of their modification by man. It demonstrates urgent needs for Congressional enactment of Interior's bill for a comprehensive Coastal Zone Management System. Except for some in Alaska, everyone of the Nation's estuaries has been modified; 23% severely, 50% moderately, and 27% slightly. Half the population utilize them for recreation, including millions who migrate from inland states to fish, sail, etc. Estuaries are favorite places for industry, which finds land cheap, water supply and transportation easy to develop, and waste disposal convenient. Residential developers find it very profitable to dredge and fill estuary areas for affluent people who wish to live near the water. A summary is given of comments from state agencies expressing their views on the feasibility and desirability of establishing a nationwide system of estuarine areas. Almost 75% of them have experienced a need for protection through acquisition where legal controls were inadequate, but only about half the States favored Federal acquisition, mostly with qualifications. DISTRIBUTION AND TRANSPORTATION OF SUSPENDED SEDIMENT IN UPPER CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. R. Schubel.
Chesapeake Bay Institute Technical Report 60, Reference 69-13, Johns Hopkins University, November 1969. 29 p, 12 fig, 16 ref.

Descriptors: *Estuaries, *Sediment transport, *Provenance, Streamflow, Sedimentation, Currents (Water), Suspended load, Scour, Suspension, Tidal effects, Turbidity, Floods.
Identifiers: Chesapeake Bay, Susquehanna River.

In the upper reaches of the Chesapeake Bay there are two distinctive distributions of suspended sediment, and associated patterns of sediment transport. During the spring freshet the Susquehanna River overpowers the characteristic net non-tidal estuarine circulation in the upper 20-30 km of the estuary and the net flow and sediment transport are seaward at all depths. The marked decrease seaward of the concentration of suspended sediment in the upper Bay reveals the close link, during the freshet, between the suspended sediment population and the principal 'ultimate' source of sediment--the Susquehanna River. With subsiding river flow the net non-tidal estuarine circulation is reestablished in the upper Bay, and a turbidity maximum is formed. The high concentrations of suspended sediment, greater than those either farther upstream in the source river or farther seaward in the estuary, are produced and maintained primarily by the periodic resuspension of bottom sediment by tidal scour, and by the sediment trap created in the upper reaches of the estuarine circulation regime. CONTROL OF SEA WATER LEVEL IN COASTAL POROUS MEDIA BY MEANS OF DOUBLE PUMPING,
Kyoto Univ. (Japan). Dept. of Civil Engineering.
Yoshiaki Iwasa, and Hitoshi Takeuchi.
French synopsis. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 391-400, 1969. 10 p, 14 fig, 1 tab, 4 ref.

Descriptors: *Groundwater movement, *Saline water-freshwater interfaces, *Aquifers, Porous media, *Mathematical models, Equations, Computers, Withdrawal, Pumping, Water resources, Water supply.
Identifiers: Coastal aquifers, Double pumping.

The mathematical theory of the selective withdrawal for fresh and sea waters by means of double pumping under several assumptions is studied. The numerical calculations for the mathematical model derived are made by the electronic computer. The results obtained are also compared with the experimental verification made in an experimental basin at the hydraulics laboratory. The double pumping technique should be useful in the utilization of fresh water in coastal aquifers. (Woodard-USGS)

PHENOMENA OF TURBULENT HORIZONTAL TRANSPORT AND DIFFUSION IN THE TIDAL COASTAL SEAS AND APPLICATION TO THE ENGLISH CHANNEL,
Grenoble Univ. (France). Faculte des Sciences.
Jean Louis Hyacinthe.
Available from NTIS as N70-17225, $3.00 in paper copy, $0.95 in microfiche. 1969. 158 p, 20 fig, 87 ref.

Descriptors:
Identifiers: *Tides, *Transport properties, *Turbulent diffusion, *Waste disposal, Coasts, Incompressible fluids, Magnetohydrodynamics, Mathematical models, Mixing length flow theory, Radioactive wastes, Rotating fluids, Scale effect, Seas, Stratified flow, Turbulent mixing.

Classical results on the homogeneous or isotropic turbulent transport properties of an incompressible fluid are compared. Theoretical and experimental results for marine and oceanic turbulent flows and horizontal turbulent transport are summarized and applied to tidal coastal waters, especially those of the English Channel. A direct experiment using buoys and coloring materials was carried out in order to choose between different hypotheses and scale laws. A rotating hydraulic model was designed to simulate tidal effects in the English Channel in order to evaluate nuclear waste disposal sites.

SEAWATER INTRUSION LENGTH IN STRATIFIED ESTUARIES,
Norsk Institutt for Vannforskning, Oslo.
Y. F. Ozturk.
Water Research, Vol 4, No 7, p 477-484, July 1970. 8 p, 5 fig, 1 ref.

Descriptors: *Saline water intrusion, *Estuaries, *Stratified flow, *Length, *Model studies, Saline water-Freshwater interfaces, Mixing, Sea water, Equations, Theoretical analysis, Density stratification, Velocity, Streamflow, Flow rates, Tides, Meteorology, Channel morphology.
Identifiers: Stratified estuaries.

The hydrodynamical evaluation of the sea-water intrusion length is based on the theory of density currents. Although the geometry of estuaries may vary from place to place the experimental estuaries used for this purpose are usually the channels of constant shape which do not include the influence of the local variations in depth, width, velocity and salinity. For the analysis of theoretical principals of sea-water intrusion length, the estuary of rectangular cross-section containing distinctly separated river-water and sea-water layers, is considered. The validity of the experimental material presented rests on the simplified estuary models, in which the effect of tide, estuary geometry and Reynolds number for the river have been neglected during

the experiments. It is concluded that by some developed model estuary or sufficient data obtained from the real estuary, the determination and introduction of estuary shape factor and Reynolds number for the river into the sea-water intrusion length equation may be possible. For the practical evaluation of arrested sea-water wedge lengths in any stratified estuary, the knowledge about the densities of sea water and river water, kinematic viscosity of river water, depth of river at the estuary mouth, velocity of river flow at the tip of wedge, and corresponding length of sea-water wedge is sufficient. (Woodard-USGS)

A STUDY OF ECONOMIC VALUE OF INCREASED ESSA SERVICES AS RELATED TO ESTUARINE DYNAMICS IN GULF COAST ESTUARIES, VOLUME I,
Gulf Universities Research Corp., Galveston, Tex.
James M. Sharp, Dan E. Feray, Ronald F. Bearden, Thomas W. Bilhorn, and Joseph R. Crump.
Available from NTIS as PB-193 722, $3.00 in paper copy, $0.95 in microfiche. Summary Technical Report, August 1970. 73 p, 9 fig. ESSA Contract E-189-69 (N).
Identifiers: *Estuaries, *Economics, Management planning, Costs, Recreation, Weather forecasting, Storms, Minerals, Aquatic animals, Natural resources, Erosion, Water pollution, Sedimentation, Mexico Gulf, Gulf Coast (US), Coastal zone management.

An initial effort was made to determine the economic benefits to be derived from a description and prediction of the dynamic behavior of estuaries, or inland water areas, along the United States margin of the Gulf of Mexico. Such services have not yet been established; therefore, service costs were derived from conceptual design studies and estimates of operation and maintenance requirements. Since the services have not been in use, data have not been accumulated which would permit the determination of economic benefits on the basis of statistical treatment. (See also W71-02607).

BUDGETARY CAPITAL COST ESTIMATES OF 1- TO 10-MGD MULTISTAGE FLASH DISTILLATION PLANTS FOR DESALTING SEA-WATER,
Oak Ridge National Lab., Tenn.
R. A. Greene, S. A. Senatore, and R. A. Ebel.
Available from NTIS as PB-193 689, $3.00 in paper copy, $0.95 in microfiche. ORNL-TM-3083, August 1970. 40 p, 12 fig, 14 tab, 2 ref. AEC Contract W7405-Eng-26, OSW Agreement No 14-30-2535.
Identifiers: *Desalination, Costs, *Distilling plants, Sea water, Programming (Computers), Pipes, Fixed investment.

By means of a computer program, capital costs were estimated for several multistage flash (MSF) desalting plants in the 1-10-Mgd size range. The plant design was assumed to be similar to the OSW 'Universal Plant' design. The report tabulates changes in capital cost estimates as a result of variations in performance ratio, tubing price, copper-nickel vs titanium tubing, flow velocity in tubes, number of vessels in the plant, number of stages, and seawater feed temperature. For all capital cost summaries, the tabulations show a breakdown into the following categories: seawater intake, sitework, buildings, evaporator, shell, pumps and motors, valves and piping, chemical systems, instruments, electrical, deaerator, brine heater, and indirect costs.

A STUDY OF THE PRODUCTION AND DETECTION OF ARTIFICIAL ICE NUCLEI,
Denver Research Inst., Colo.
Norihiko Fukuta, L. F. Evans, Young H. Paik, William A. Schmeling, and Louise A. Walter.
Available from NTIS as PB-194 129, $3.00 in paper copy, $0.95 in microfiche. Final Report for Bureau of Reclamation, July 1970. 65 p, 8 tab, 19 fig, 25 ref. BuRec Contract No 14-06-D-6444.

Descriptors: Weather modification.
Identifiers: *Cloud seeding, Artificial precipitation, *Ice, Nucleation, Crystal growth, Detection, Aerosol generators, Spraying, Cloud physics, Vapors, Condensation nuclei, Freezing, Silver iodide, Supercooling.

The present major task of weather modification engineering is the optimization of the seeding effect which depends on the purpose of seeding and the type and condition of the given cloud system. Toward this objective, a study of many subjects has been carried out concerning the production and detection of ice nuclei, and growth of the formed ice crystals. Major achievements are as follows: development of organic ice nuclei generators; development of airborne volatile liquid ice crystal generators; development of a slow activation ice nucleus counter; and development of ice crystal growth theory from vapor.

PUBLIC WATER SUPPLIES IN LOUISIANA,
Geological Survey, Baton Rouge, La.
Don C. Dial.
Louisiana Department of Public Works Basic Records Report No 3, 1970. 460 p, 14 fig, 1 tab, 22 ref.

Descriptors: *Municipal water, *Data collections, *Water supply, *Water utilization, *Louisiana, Groundwater, Aquifers, Surface waters, Water sources, Mississippi River, Lakes, Public utilities.
Identifiers: *Public water supplies, Basic data.

This report contains water-supply information for 291 municipalities, parish water districts, and most privately owned water districts. Groundwater is used by 246 municipalities and water districts, and surface water by 45. The following information, if applicable, is given for each facility: owner, source of supply, population, number of services, treatment procedure, pumpage, well logs, and chemical analyses of water samples. Mechanical analyses of sand samples and aquifer-test results are included to the extent that such results are available. Fresh water is available in 6 major aquifer systems ranging in age from Paleocene to Pleistocene. Southeastern parishes are underlain by as many as 15 fresh-water-bearing sands, and most towns obtain supplies from two or more aquifers. Large quantities of water are provided by the mississippi and Atchafalaya Rivers. Almost all towns downstream from Iberville Parish use water from the Mississippi, which must be treated for public needs. Intrusion of salty water from the Gulf must

be monitored in the lower reaches. A total of 377 mgd of water is pumped for Louisiana public supplies. (Lang-USGS)

GRAZING STUDIES IN THE ARID AND SEMI-ARID ZONES OF RAJASTHAN. VII: UTILIZATION OF VEGETATION COVER, GRAZING BEHAVIOUR OF SHEEP AND SEASONAL VARIATION OF CRUDE PROTEIN CONTENT OF PLANTS IN DIFFERENT PASTURES,
Central Arid Zone Research Inst., Jodhpur (India).
A. K. Chakravarty, Ram Ratan, and K. C. Singh.
Annals of Arid Zone, Vol 9, No 1, p 10-16, March 1970. 2 fig, 4 tab, 1 ref.

Descriptors: *Forage grasses, *Arid lands, *Grazing, *Sheep, Ecology, Forage palatability, Pasture management, Plant groupings, On-site investigations, Xerophytes, Herbivores, Environmental effects, Proteins, Rainfall, Animal behavior, Data collections, Monthly, Seasonal, Semiarid climates, Range grasses, Variability, Vegetation effects.
Identifiers: *India, *Protein content (Crude), *Basal cover, Annual grasses, Perennial grasses.

In arid zones, knowledge of the overall value of herbage in different seasons is important for sheep farming. Utilization and crude protein content of pasture plants and ewe grazing behavior were studied for 10.5 months in 4 different pasture paddocks sown with various combinations of Rajasthan range grasses. During this period, there were 6 months of no rainfall and 4 months of over 60 mm. Monthly data were recorded on crude protein content and basal cover before and after grazing. General protein status is comparatively low except during the July-September rainy season. Over the year, crude protein percentages varied from 2.8-9.2 for perennials and from 12.4-17.3 for the better annuals. In terms of grazing stress resistance and basal cover increase, the most promising grasses, in order, were Cenchrus ciliaris, C. setigerus and Lasiurus sindicus. Most of the annuals appeared during the rainy season and the most palatable were Brachiaria ramosa, C. microphyllus, Indigofera cordifolia and I. linifolia. (Casey-Arizona)

SPECIALIZATION OF AGRICULTURE IN RELATIVELY SIMILAR NATURAL ENVIRONMENTS OF THE USSR AND THE UNITED STATES,
Moscow State Univ. (USSR).
A. Ye. Granovskaya.
Translated from: Vestnik Moskovskogo Universiteta, Geografiya, No 4, p 79-90, 1968. Soviet Geography: Review and Translation, Vol 9, No 8, p 830-837, 1968. 1 fig, 7 ref.

Descriptors: *Geographical regions, *Soil types, *Climatic zones, *Regional analysis, Temperature, Water balance, Arid lands, Semiarid climates, Humid areas, Comparative productivity, Wheat, Forages, Dairy industry, Montana, North Dakota, Minnesota, Chernozems, Chestnut soils, Forest soils, Podzols, Agriculture, Grazing, Crop production, Data collections, Grasslands, Grains (Crops), Land use.
Identifiers: *USSR, *Temperature-sum isolines, *Comparative regional studies, Animal production.

Agricultural land-use comparisons between differing countries require some means of standardizing the physical attributes of comparable regions. Minor civil divisions in the U. S. (counties) and the USSR (rayons) were related on the basis of soil types and climate (temperature and moisture conditions). In each geographical zone one civil division from each country was compared. The 4 similar zones studied were: (1) dry steppe and chestnut soils, (2) moderately dry steppe and chernozem soils, (3) broadleaf forest and gray forest soils and (4) needleleaf forest and sod-podzolic soils. The comparisons suggest that agricultural differentiation by physical zone is quite different in the two countries. Animal products predominate in all U. S. zones except the very dry steppe where grains were sharply dominant. Grain yields, dairying and forage crops increased along the gradient of negative to positive water balance. In the USSR, such interzonal differences were less pronounced in forage production while crop and grain production rose markedly from dry to humid areas. The Soviets relegate animal production to a secondary role and derive their principle income from bread grains and industrial row crops. (Casey-Arizona)

French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 411-421, 1969. 11 p, 9 fig, 11 ref.

Descriptors: *Groundwater movement, Seepage, *Underseepage, *Levees, *Dams, Mathematical models, Equations, Aquifer characteristics, Flow, Infiltration, Hydraulic gradient, Leakage, Permeability, Water levels, Drainage.

Mathematical models of some typical sections of groundwater flow fields (confined flow, leaky water-bearing strata, flow to incomplete ditches, series of wells, etc.), with the fundamentals of the derivation of these mathematical relations, as well as with the interlacing laws dealing with these sections, are presented. The practical use of hydraulic network schemes is described using dam and dike seepage as an example and it is shown that this method can be used for solving very complex flow problems. It is demonstrated that this method of calculation can be used also for geohydraulic problems of underseepage in the case of massive hydraulic structures and for problems of bank filtration, artificial groundwater enrichment, opencast mine drainage, and many other problems. FLOOD PLAIN INFORMATION, CITY OF ALEXANDRIA AND ARLINGTON COUNTY, VIRGINIA, FOURMILE RUN.
Corps of Engineers, Baltimore, Maryland.

Report, October 1968. 38 p, 11 fig, 7 tab.

Descriptors: *Flood forecasting, *Flood plains, *Flood damage, *Storm runoff, *Urbanization, Maximum probable flood, Planning, Flood control, Flood plain zoning, Floodproofing, Runoff, Virginia, Streamflow forecasting, Drainage, Regional flood, Land development, Flash floods.
Identifiers: *Fourmile Run, Arlington County, Alexandria, Arlandria.

Flooding was studied on the lower 3 miles of Fourmile Run, a floodway draining 18.5 square miles that flows 9 miles through Arlington County, along the northern boundary of Alexandria, Virginia, and discharges into the Potomac River downstream of Washington National Airport. During the largest flood of record, in August 1963, damage to business properties in a four-block stretch of Arlandria was estimated at more than one million dollars. Two significant phases are covered of the Fourmile Run flood problem: (1) the largest known floods, and (2) probable future floods. Estimates are made of the maximum velocities, discharge rates, and flood depths that would result from a flood having a 100 year average recurrence interval, and from the maximum probable flood that could ever be anticipated in the area. This latter flood would top the flood depth of record by 10.3 feet on Mount Vernon Avenue in Arlandria, and discharge 25,000 cfs at its peak. The report is intended to provide the basis for further study and planning by Arlington County and Alexandria to develop solutions. The report contains maps, profiles and cross-sections that indicate the extent of future flooding anticipated. These can be used to guide and plan land developments, and to formulate zoning ordinances and subdivision regulations. They can also be used in planning flood protection works. (Poertner)

THE EFFECTIVENESS OF FLOOD CONTROL STRUCTURES OF THE LOWER MINNESOTA RIVER WATERSHED DISTRICT.
Lower Minnesota River Watershed District, Burnsville.

Available from NTIS as PB-196 114, $3.00 in paper copy, $0.95 in microfiche. Lower Minnesota River Watershed District and Office of Water Resources Research Cooperative Report, July 1970. 136 p, 61 fig, 7 tab, 22 ref, 3 append. OWRR Project C-1239 (No 1602) (1).

Descriptors: *Flood control, *Flood protection, *Flood plain zoning, *Non-structural alternatives, *Minnesota, Floodproofing, Regulation, Zoning, Building codes, Flood plains, Overflow, River basin development, Cost-benefit analysis, Levees, Channel improvement, Frequency analysis, Flood damage, Data collections.
Identifiers: *Minnesota River.

Flood protective structures in the Lower Minnesota River Watershed District, properly planned and constructed, are economical in providing protection against potential floods from the Minnesota River only for existing installations. New construction in the flood plain should include flood protection by proper location of structures as an integral part of the original design. In most cases, capital improvements should be made above the flood plain and far enough away from the main channel of the Minnesota River so as not to unduly restrict flood flows. Proper flood plain management and zoning could eliminate the need for structural measures of flood protection. Dikes, bulkheads, sandbagging, dams, and other structures would not be necessary if the flood plain were developed according to sound flood plain management principles. There is no economic necessity for flood protective structures on agricultural lands even though the land is flooded on an average of once a year. Agricultural use of the flood plain does not restrict high flows and is, therefore, a good use of the flood plain. Low cost flood plain management is the most economical means of reducing and eliminating both losses and the need for further protection. (Knapp-USGS)

Identifiers: Revetment.

Defendant railroad constructed a trestle and bridge across a river. When the force of the river current began to wear away the railroad right-of-way, defendant constructed a rock revetment. The water struck the revetment and was diverted with such force that the river channel was altered, eroding plaintiff's property below the bridge. Plaintiff sought damages for permanent injury to his property, contending that defendant was collecting water upstream of the bridge and causing it to discharge onto his property. The Kansas City Court of Appeals affirmed a judgment for defendant, stating that defendant was within its rights in preventing erosion of its property. Plaintiff's loss was merely incidental to defendant's exercise of its right. There was no showing of negligence in defendant's construction of the embankment. (Dye-Florida)

FLOOD PLAIN INFORMATION, FLOOD HAZARD REPORT OF 4-7 JULY 1969 FLOOD, BLACK RIVER, OHIO.
Corps of Engineers, Buffalo, N.Y.

Corps of Engineers Flood Plain Report, May 1970. 9 p, 6 fig, 12 plate, 2 tab.

Descriptors: *Floods, *Flood damage, *Historic flood, Flood plains, Ohio, Flood control, Nonstructural alternatives, Flood protection.
Identifiers: Black River (Ohio), Flood-hazard report.

This flood hazard report presents information specifically for the historical July 1969 flood, including the flooded area map and water surface profiles. Precipitation gages in the Black River watershed show that more than 4 in of rain fell in a 24-hr period with an average intensity of 0.17 in per hr, an occurence interval of once in 50 yr. The USGS water stage recorder below the confluence of East and West branches of the river was washed away, having been in operation since 1944. Industrial plants and Elyria City were damaged by high water and debris. Major floods have occurred along this river in the following decreasing order of magnitude: March 1913, January 1959, May 1956, February 1959, and June 1937. Maps, profiles, photographs and other data are given which will be beneficial for planning and development by State and local governments. (Lang-USGS)
W71-02447

FLOOD PLAIN INFORMATION, DESTIN COASTAL AREA, OKALOOSA COUNTY, FLORIDA.
Corps of Engineers, Mobile, Ala.

Corps of Engineers Flood Plain Report, June 1970. 19 p, 4 fig, 9 plate, 1 tab.

Descriptors: *Hurricanes, *Flooding, *Tidal waters, *Wind tides, Flood damage, Beaches, Gulf of Mexico, Florida, Historic flood, Flood forecasting.
Identifiers: *Flood tides, Intermediate regional flood.

Tidal flooding along the northern coast of the Gulf of Mexico near Destin, Florida is described to aid local agencies with factual bases for reducing future damages and hazards through planning better utilization of areas subject to flooding. Basic data used in preparation of the report include historical flood heights, hurricane pressure, radius and speed, tide records, and flood damage records. The greatest known flood tide at Destin occurred during the hurricane of September 20, 1926 and was 10 to 12 ft above msl on the beach. Other hurricanes causing lesser flood tides occurred in September 1906, July 1936, August 1950, and September 1956. Maximum winds range from 75 to over 200 mph (the strongest was during Camille in August 1969). The 1926 hurricane at Destin had winds up to about 150 mph. (Lang-USGS)
W71-02453

FLOOD PLAIN INFORMATION, YAKIMA-UNION GAP, WASHINGTON.
Corps of Engineers, Seattle, Wash.

Corps of Engineers Flood Plain Report, May 1970. 57 p, 22 fig, 17 plate, 15 tab.

Descriptors: *Floods, *Flood damage, *Washington, Flood plains, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: *Flood records, *Yakima River, Naches River, Stnadard project flood, Intermediate regional flood.

Flooding along the Yakima and Naches Rivers near the cities of Yakima and Union Gap, Washington is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and test material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall runoff, historical flood heights and other technical data. The December 1933 flood is the largest known on Yakima River and had a peak stage of 15 ft at Parker. An intermediate regional flood has a 1% chance of being equalled or exceeded annually, and maximum flow would be about 70,000 cfs at Parker, while the standard project flood has a peak discharge of 180,000 cfs in the Yakima reach studied. Water velocities vary widely at different places on the floodplain, and flood duration may be for a month. (Woodard-USGS)
W71-02456

FLOOD PLAIN INFORMATION, LITTLE WEKIVA RIVER, SEMINOLE COUNTY, FLORIDA.
Corps of Engineers, Jacksonville, Fla.

Corps of Engineers Flood Plain Report, September 1970. 31 p, 7 fig, 9 plate, 6 tab.

Descriptors: *Floods, *Flood damage, *Florida, Flood plains, Regional flood, Flood forecasting, Flood control, Hurricane.
Identifiers: *Seminole County (Fla), Standard project flood, Intermediate regional flood.

Flooding along Little Wekiva River in western Seminole County, Florida is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and test material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. Velocities of water during the Intermediate Regional Flood would range up to 7.3 feet per second (5 miles per hour) in the channel of Little Wekiva River. During the Standard Project Flood channel velocities of up to 7.8 feet per second can be expected. Velocities in the flood plain for both Intermediate Regional and Standard Project Floods would vary widely, but would generally be less than 2.2 feet per second. The scheduled construction of the new culverts at S.R. 436 will increase velocities in the channel by 0.7 foot per second and in the flood plain by 0.2 foot per second. Velocities greater than 3 feet per second combined with depths of 3 feet or more are generally considered hazardous. (Woodard-USGS)
W71-02457

LOCATING AND TRACING SEEPAGE WATER IN UNSTABLE SLOPES,
Kentucky Dept. of Highways, Lexington. Div. of Research.
Y. A. Alkhoja, and G. D. Scott.
Final Report, February 20, 1970. 37 p. HPR - Kyhpr 63-16.

Descriptors: *Seepage, *Tracers, *Groundwater, *Locating, Slope Stability, Landfills, Fluorescence, Ultraviolet Radiation, Water table, Resistivity, Moisture content, Drilling, Percolation, Dye releases.

A practical method of locating and tracing seepage water in unstable slopes is needed. The study consisted of testing several methods at sidehill fill locations where the highway was distressed. In each case, construction of the fill had blocked drainage. The results of the study indicate the following: (1) Clean, fine sand did not remove fluorescent dye from solution for moderate percolation distances, but the dye became somewhat less detectable due to its absorption by the sand for longer percolation distances. The conventional monitoring equipment (ultraviolet light) was not sufficiently efficient to monitor low concentrations of the dye. The tracer method was not dependable for the purpose of locating seepage waters and was shown to require further improvement. However, it was used to verify a suspected source of seepage when the ground water was believed to have traveled through defined channels or very porous material, (2) The water table observation method was the most definitive and useful of the methods studied for tracing and locating seepage water, (3) The electrical resistivity method did not yield very accurate and dependable results without correlation with actual site moisture conditions, and (4) With more and better selection of sampling holes and resistivity observations, more useful results could be obtained from this method. Since the resistivity results show fair correlations with actual moisture conditions, it is concluded that this method could be used as a preliminary guide as to where drilling should be performed, and possibly to extend relative moisture content data to areas inaccessible to drilling equipment.
W71-02522

PERFORMANCE OF AN ASPHALT TREATED DRAINAGE BLANKET IN A FLEXIBLE PAVEMENT SECTION,
California State Div. of Highways, Sacramento.
T. Smith, R. Forsyth, and W. Gray.
Interim Report M and R No 632618, December 1969. 37 p. 4830213 70.

Descriptors: *Subsurface drainage, *Drainage systems, *Asphalt, *Roads, Filters, Stabilization, Highways.
Identifiers: *Drainage blankets.

Results are presented of a field evaluation of a two-layer highway drainage system on Road 299 between Arcata and Willow Creek in the Northern Coastal Region of California. The experimental section consisted of 400 feet utilizing a two-layer drainage blanket, the top, or drainage element, which was stabilized with asphalt, and 200 feet of normal single-layer drainage blanket serving as a control. The section was located in a cut section with numerous springs and seeps in a high rainfall areas Data from field permeability tests indicated that the drainage capacity of the two-layer system was 3 to 9 times that of the standard underdrain section, while theory indicated a 24 to 1 ratio. Through an unusually wet winter and spring, both sections effectively drained all subsurface water at

the site. Only minor difficulties were encountered in the construction of the two-layer system which could probably have been eliminated by a modification in the grading of the filter element.
W71-02523

STUDY OF EROSION IN ROADSIDE DRAINAGE CHANNELS IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. School of Engineering.
Michael Amein, and H. L. Chu.
Final Report ERD-110-68-4, Appendix, September 1969. 63 p.

Descriptors: *Erosion control, *Roads, *Drainage systems, Design, Channels, *Soil erosion, *Surface drainage, Highways.
Identifiers: *Roadside.

An extensive field study of the performance of roadside drainage channels in North Carolina against the action of erosive forces was conducted. From the results of field observations and measurements, a criteria for the design of stable roadside channels was developed. The report presents three methods of determining whether a triangular shaped roadside drainage channel will be stable if it is fully grassed, partially grassed or bare earth when the discharge to be carried, the slope of the channel bottom, the side slope of the channel, and the soil characteristics of the channel are known. Plaintiff landowner brought an action to recover for damages done to his crops caused by defendant power company's negligent operation of a dam. Following an extremely heavy rainfall, the dam developed severe breaks, and it became necessary to open the floodgate while repairs were made, thus allowing the impounded water to flow from the reservoir and flood plaintiff's land. Defendant argued that the allegations were insufficient to establish a case of negligence. The Supreme Court of Minnesota, affirming a judgment for plaintiff, ruled that either of two theories of negligence would be sufficient to have such a case determined by a jury: (1) the doctrine of res ipsa loguitur, and (2) the theory that while an owner of a dam is not an insuror of its safety, he still must exercise care commensurate with any danger which might reasonable stem from the operation of the dam. MERCER COUNTY, NEW JERSEY, COMPREHENSIVE PLAN: STORM WATER RUNOFF AND DRAINAGE FACILITIES.
Mercer County Planning Board, Trenton, N.J.

Available from Ntis as PB-193 993, $3.00 in paper copy, $0.95 in microfiche. Final Report No 6, September 1969. 30 p, 5 tab, 10 ref. HUD Project NJ P-96.
Identifiers: *Regional planning, *New Jersey, *Drainage, Regional planning, *Runoff, Rainfall, Culverts, Bridges (Structures), Surveys, Factor analysis, Statistical data, Storm drainage, Storm water, *Mercer County (NJ).

Major problems occur in developing areas when open land which formerly absorbed rain water becomes covered with structures and asphalt. The county has a major responsibility in ensuring that, as land becomes developed and storm water runoffs increase, facilities guiding flows under county roads remain adequate to handle the increased water flow. The report analyzes each of the drainage areas adjacent to existing major county bridges or culverts to determine whether they will be adequate to handle increased flows when the drainage areas develop as presently zoned.

COMBATTING SALT-WATER ENCROACHMENT INTO THE BISCAYE AQUIFER--MIAMI, FLORIDA AREA,
Dade County Public Works Department, Miami, Florida.
F. D. Ronald Park.
Presented at Ltd Professional Symposium on Salt Water Encroachment Into Aquifers, May 4-5, 1967, Louisiana State University. Copies of report available from LSU Bookstore, $5.00. In: 'Salt Water Encroachment Into Aquifers', Bulletin 3, Louisana Water Resources Research Institute, Louisiana State University, Baton Rouge, October 1968. 73 p, 27 fig, 2 tab, 16 ref.

Descriptors: *Encroachment, *Aquifers, *Water quality, *Groundwater, *Water management, *Water supply, Dams, Canal seepage, Leakage, Fresh water, Potable water, Florida.
Identifiers: *Miami (Florida).

The fresh water supply serving the people of the Miami, Florida area is pumped from the Biscayne Aquifer which covers about 3,000 square miles of Dade and Broward Counties and penetrates about 40 miles inland from the Atlantic Ocean and Biscayne Bay. The aquifer is wedge-shaped in elevation, with the base averaging 100 feet below sea level along the coast and rising gradually to zero elevation at its western extremity. The aquifer leaks along its sides. Subsequent to the drainage of the Everglades in 1904, salt water has encroached as far inland as six miles. Programs of Dade County, the Central and Southern Florida Flood Control District, and the U. S. Corps of Engineers have generally stabilized the salt front. Dams are employed in the area's canals to prevent salt water encroachment; however, where the dams are located far inland, to facilitate navigation, encroachment continues. Dams are of two main types: (1) steel piling cut-offs, with removal sections for facilitating large outflows; and (2) automatic vertical-lift gates. The paper describes the problems encountered and the measures implemented in Dade County's 20-year program of combatting salt water encroachment. Legal questions and the effects of the program on water supply, pollution, navigation, land use, subdivision development and people are discussed. (Poertner)

HYDRAULIC TESTS IN HOLE UA-1 AND WATER INFLOW INTO AN UNDERGROUND CHAMBER, AMCHITKA ISLAND, ALASKA,
Geological Survey, Denver, Colo.
Wilbur C. Ballance.
Geological Survey Open-file Report (Ref Amchitka-21, USGS-474-72), October 1970. 54 p, 37 fig, 1 tab, 4 ref. USAEC Contract AT (29-2)-474.

Descriptors: *Groundwater movement, *Hydraulic gradient, *Drill holes, *Inflow, Aquifers, Mining, Injection wells, Equations, Test procedures, Water levels, Transmissivity, Hydraulic conductivity, Velocity, Storage capacity.
Identifiers: *Underground chamber, Swabbing recovery test.

Hole UA-1, Amchitka Island, was center punched from 1,524.0 to 1,981.2 meters and hydraulically tested to determine an ideal location for mining a chamber. Fifteen zones were tested. Minor amounts of water bypassed the packers during five of the tests. The tested intervals ranged in length from 37.5 to 211.5 meters. For purposes of comparison, relative specific capacities were calculated from comparable 60.4-meter intervals of tested rock, and ranged from 0.1162 to 0.0039 cubic meters per day per meter of drawdown. The interval, 1,745.0 to 1,836.4 meters, appears to be the best location for mining a chamber so far as water inflow is concerned. This interval, 91.4 meters, consists of about 27.4 meters of breccia and 64.0 meters of basalt. The inflow to a spherical chamber 18.3 meters in diameter placed in the center of the proposed 91.4-meter interval, was calculated to be about 175 cubic meters per day after the first day and would stabilize at about 57 cubic meters per day after about 200 days. STREAM SEDIMENT: AN ENVIRONMENTAL PROBLEM,
Geological Survey, Fort Collins, Colo.
Harold P. Guy, and George E. Ferguson.
Journal of Soil and Water Conservation, Vol 25, No 6, p 217-221, November-December 1970. 5 p, 2 fig, 3 tab, 19 ref.

Descriptors: *Sedimentation, *Erosion, *Urbanization, *Erosion control, Storm runoff, Accelerated erosion, Soil erosion, Sediment yield, Provenance, Land use, Floods, Land management.
Identifiers: *Urban erosion, *Construction-site erosion.

Urban erosion involves construction sites that tend to be widely dispersed. Unlike the continuing erosion on poorly managed agricultural lands, construction sites erode mainly during the brief periods between land clearing and stabilization of the new surface. In Scott Run, a 4.54-square-mile watershed near Washington, D.C., highway construction affected about 11% of the watershed from 1961 to 1964. Measurements of 88 storm events showed that 37% of the runoff and 99% of the sediment movement occurred in 3% of the time, and that highway construction areas, 1 to 10% of the basin, contributed 85% of the sediment. Erosion was about 10 times that normally expected from cultivated land, 200 times that expected from grassland and 2,000 times that expected from forest land. Sediment transport in storm runoff was measured for 25 storm events from a 58-acre watershed in Kensington, Md., between July 1959 and January 1962. During this period, 89 single-dwelling houses were constructed on 20 1/2 acres in the upper part of the watershed. An average of 189 tons of sediment per acre was lost from the area. (Knapp-USGS)

Descriptors: *Land management, *Impaired water quality, *Bibliographies, *Reviews, Erosion, Groundwater movement, Watersheds (Basins), Soil management, Saturated soils, Floods, Water supply, Publications, Runoff, Land use, Vegetation effects, Forecasts.
Identifiers: *Australia, Annotated bibliography, Literature evaluation, Catchment management.

This report results from a project recommended by the Australian Water Resources Council to compile the important sources of water information with emphasis on Australian work but also to search overseas literature largely on principles and methodologies. A centralization of water information is needed for use by authorities in catchment basin management, and is prerequisite for future experimental studies and research. To fulfill the major objectives, an annotated bibliography and a critical evaluation of the literature and current knowledge is presented in this report. A major change that has occurred since settlement of Australia by Europeans is that large areas of native bush have been cleared for pasture or crops with quite apparent effects on the hydrologic cycle. Little precise knowledge is available, but an increase has been noted in total runoff in some stream basins, and the change from trees to grasses and crops has resulted in raising of saline groundwater levels at the foot of slopes and in valleys. Subsequent salting of large areas is evident as water evaporates from the shallow groundwater bodies. Increased erosion has occurred and turbidity levels in streams have risen. The report cites work in progress and needed investigations. Contains 1,092 references distributed under 11 subject chapters. (Lang-USGS)

4D. Watershed Protection

URBAN SOIL EROSION AND SEDIMENT CONTROL,
National Association of Counties Research Foundation, Washington, D.C.
Mel D. Powell, William C. Winter, and William P. Bodwitch.
Available from the NTIS as PB-196 111, $0.95 in microfiche. For sale by the Superintendent of Documents, US Government Printing Office, Washington, D.C. 20402. Price $1.00, Order no I67.13/4:1503 DTL05. Water Pollution Control Research Series 15030 DTL, May 1970. 97 p. FWQA Program 15030 DTL.

Descriptors: Sedimentation, *Soil erosion, *Sediment control, Urban runoff, Watershed management, *Drainage control, *Reviews, *Urbanization, Soil conservation, Legislation, Social aspects, Legal aspects, Water pollution control, Governments, Water law.
Identifiers: *Urban sediment control.

This study was conducted to determine the causes and the extent of urban and suburban soil erosion and sediment problems, and to describe ways in which local communities can organize and implement effective sedimentation control programs. An evaluation is provided on the state-of-the-art of urban sedimentation control, and a series of research needs in the sedimentation field is cited. In addition, this report includes the 'Community Action Guidebook for Soil Erosion and Sediment Control' (See also W70-06574) which describes methods by which local governments can organize, plan, finance, staff, and implement urban sedimentation control programs. Aspects of areawide approaches, legal authority, and public support for sedimentation control are discussed, and an action plan is outlined. It was found that soil erosion and sediment in developing areas is extensive, and that these problems pose significant threats to both soil and water resources. While many of the required technical means for controlling sedimentation problems already exist, new administrative approaches are needed which accomodate the diversity of interests and pressures associated with urban and suburban development. PROCEEDINGS OF THE NATIONAL CONFERENCE ON SEDIMENT CONTROL.
Dept. of Housing and Urban Development, Washington, D.C. Office of Metropolitan Planning and Development.

Proceedings of National Conference on Sediment Control, U.S. Dept. of Housing and Urban Development, Environmental Planning Paper, May 1970. 54 p.

Descriptors: *Sedimentation, *Urbanization, *Cities, *Erosion, Deposition (Sediments), Silting, Legislation, Legal aspects, Regulation, Water pollution sources, Water quality control, Conferences, Reviews.
Identifiers: *Urban sediment control.

The National Conference on Sediment Control was convened in Washington, D.C. on September 14-16, 1969. The purpose was to bring together representatives of state, regional and local agencies to explore ways of combating soil erosion and sedi-

ment problems in urban and suburban areas. A major task of the conference was the development of a final version of a 'Community Action Guidebook for Soil Erosion and Sediment Control'. It is estimated that more than 4,000 acres a day are being plowed up to build real estate developments, suburban facilities, highways and industries. Sediment yields from some of these activities are believed to be 500 times greater than from rural soil erosion, and urban drainage from concrete surfaces provides another substantial source of sediment deposits. Nine papers are printed in the proceedings; they describe pertinent policies and programs aimed at efforts by Federal, State and local officials to obtain more effective sediment controls in urban and suburban areas. 05. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification of Pollutants

WATER GEOCHEMISTRY, HOG CREEK BASIN, CENTRAL TEXAS,
Baylor Univ., Waco, Tex. Dept. of Geology.
Thomas H. Moore.
Available from Dept of Geology, Baylor Univ, Waco, Tex 76703 - Price $1.04. Baylor Geological Studies Bulletin No 18, Baylor University, Spring 1970. 44 p, 52 fig, 1 tab, 35 ref, 3 append.

Descriptors: *Water chemistry, *Hydrologic cycle, *Hydrogeology, *Chemical analysis, *Texas, Geologic investigations, Rainfall, Runoff, Streamflow, Drainage, Infiltration, Groundwater movement, Aquifer characteristics, Spring waters, Geochemistry, Climatic data, Land use, Fertilizers, Soil-water-plant relationships.
Identifiers: Central Texas, Hurst Spring.

This report describes water quality changes in the upper part of Hog Creek basin (48.6 sq mi area), Central Texas, from the time of rainfall on the headwaters until the streamflow reaches Farm Road 217, about 19 mi downstream. Temperature, pH, and dissolved oxygen were measured in the field at 5 sites and various chemical tests were made in the laboratory. Except for brief periods of storm runoff, the creek flow is from springs, principally Hurst Spring. Analyses were made of water samples from each of the major rock formations. The Edwards Limestone, a shallow aquifer, is subject to pollution from agricultural fertilizers as was disclosed by unusually high nitrate concentrations. The highest concentration of dissolved solids and the lowest pH values were in Hurst Spring samples. The average ion concentration was 480 ppm; highest concentrations occurred during dry-weather flow. As the creek flows across formations of different lithologic hcaracter, the chemical character of its water changes in relation to the chemistry of the rocks. (Lang-USGS)

DETERMINATION OF PENTACHLOROPHENOL IN ORGANIC TISSUES AND WATER,
Swedish Water and Air Pollution Research Lab, Stockholm.
Lars Rudling.
Water Research, Vol 4, No 8, p 533-537, August 1970. 5 p, 1 fig, 5 tab, 1 ref.

Descriptors: *Pollutant identification, *Chemical analysis, *Chlorinated hydrocarbon pesticides, *Fungicides, Wood preservatives (Pesticides), Gas chromatography, Analytical techniques.
Identifiers: Pentachlorophenol.

A method for the determination of pentachlorophenol (PCP) in tissues and natural waters is described. The PCP is extracted from the acidified sample with n-hexane and then re-extracted into a borax solution. It is then acetylated by extracting with n-hexane containing acetic acid anhydride and pyridine. The resulting pentachlorophenyl acetate is analyzed by gas chromatography using an electron capture detector. The PCP content in fish from a lake into which PCP is discharged is reported. The data obtained indicate that PCP accumulate in aquatic organisms. The identity of the PCP was established by combined gas chromatographic--mass spectrometric analysis. (Knapp-USGS)

WATER QUALITY STANDARDS FOR TEMPERATURE,
Federal Water Pollution Control Administration, Washington, D.C. Office of Program Planning and Development.
Robert S. Burd.
In: Engineering Aspects of Thermal Pollution, Chapter 3, p 72-77, 1969.

Descriptors: *Standards, *Temperature, Thermal pollution, Water quality, Fish, Environmental effects, Water pollution, Heated water.

Summary of water quality standards approved by FWPCA referring to the temperature and temperature increase caused by thermal discharges are discussed. The water quality standards vary significantly from state to state, both numerical and narrative approaches were used by most states. Numerical criteria were tailored to the type of fishery to be protected. Numerical limits generally referenced a seasonal maximum, allowable change from background temperatures, and occasionally a rate of change. There is felt a necessity of proper definition of mixing zone. The proposals for further research is stated. (See also W71-02478) (Novotny-Vanderbilt)

RESEARCH NEEDS FOR THERMAL POLLUTION CONTROL,
Federal Water Pollution Control Administration, Washington, D.C.
J. Frances Allen.
In: Biological Aspects of Thermal Pollution, Chapter 12, p 382-391, 1969. 11 ref.

Descriptors: *Thermal pollution, *Research and development, *Environmental effects, *Temperature, *Fish, *Fish food organisms, Self-purification, Water pollution, Water quality, Ecology, Food chains, Ecosystems.

Research needs for freshwater, marine, and estuarine life have not been treated separately, for the needs are similar. Knowledge of the organisms occupying any of these environments is so inadequate that it is necessary to have some kind of investigations. Design of such studies would be adapted to meet the unique and diverse conditions of a given situation. Immediate attention should be directed toward the determination of the effects of temperature on reproduction and growth of important fishes, shellfish, or other desired harvestable crop. This should be followed closely by, or simultaneously with, the determination of thermal effects on food-chain organisms. This approach is required for all life-history stages. Research should reduce the lack of knowledge on thermal effects in conjunction with other parameters, particularly on long-term effects, direct and indirect. Effects on other physiological processes, migratory behavior, ecological stability, increased sensitivity to toxicity, susceptibility to disease, and predator-prey relationships must be considered. Long-term effects should be stressed. More definitive work should be focused on temperature effects on the alteration of the environment, including salinity, temperature, current patterns, and chemical exchange. Although much data are available, especially on salinity and current patterns, more refined techniques are required to analyze the implications and interpretations of these data. Definitive surveys must be initiated in areas of temperate, subtropical, and tropical waters, where thermal loading is a distinct possibility. The influence of increased temperatures on the nutrient cycle, with subsequent eutrophications as a strong possibility, should receive due recognition. (See also W71-02491) (Novotny-Vanderbilt)

THE REMOTE SENSING OF OIL SLICKS BY RADAR,
Naval Research Lab., Washington, D.C.
N. W. Guinard, and C. G. Purves.
Available from NTIS as AD-709 982, $3.00 in paper copy, $0.95 in microfiche. April 1970. 10 p. NRL Proj RO7-02.
Identifiers: *Water pollution, Oils, *Radar, Sensors, *Oils, Detection, Airborne, Oil slicks.

The NRL Four frequency Radar System, at Coast Guard request, was flown over the oil slick caused by the wreck of the tanker Arrow in the Chedabucto Bay area of Nova Scotia on 17 February 1970. The oil slick was mapped remotely from an EC-121 aircraft in both the horizontal and vertical polarizations. Synthetic aperature imagery was obtained in the P,X,L and C-band. This data clearly established the value of the radar sensing techniques as a tool for locating and monitoring oil spills.

CARBON MONITOR,
Automated Environmental Systems, Inc.
Frank R. Boucher.
Instruments and Control Systems, Vol 43, No 1, p 22-23, January 1970. 1 fig.

Descriptors: *Carbon, *Organic matter, *Monitoring, *Infrared radiation, Carbon dioxide, Instrumentation.
Identifiers: *Total organic carbon, Infrared analyzer.

A new total organic carbon (TOC) monitor has been developed which provides continuous measurement with no manual pretreatment or manipulation. The instrument consists of a sample feed and pretreatment system, which removes inorganic carbon from the effluent stream; an oxidation system, which converts the organic carbon to carbon dioxide; and an infrared analyzer which measures the carbon dioxide and produces a signal directly proportional to TOC in the stream. The effluent produced by the monitor contains gaseous water, carbon dioxide and oxygen, plus oxidation products of noncarbonaceous compounds. The carbon dioxide in the effluent is proportional to the total organic carbon in the sample stream. (Little-Battelle)
W71-02672

A RAPID, NONDESTRUCTIVE TECHNIQUE FOR INFRARED IDENTIFICATION OF CRUDE OILS BY INTERNAL REFLECTION SPECTROMETRY,
James S. Mattson, Harry B. Mark, Jr., Ronald L. Kolpack, and Clarence E. Schutt.
Analytical Chemistry, Vol 42, No 2, p 234-238, February 1970. 5 fig, 2 tab, 17 ref.

Descriptors: *Oil, *Spectrophotometry, Chemical analysis, Data processing.
Identifiers: *Internal reflection spectrometry, *Crude oil, *Tar, *Santa Barbara channel, Platform A Infrared spectrometry.

A rapid, direct, and qualitative internal reflection spectroscopic (IRS) technique for the identification and differentiation of crude oils and tars is presented. The sample needs no pretreatment and may either be a liquid or mixed with a solid substrate. As IRS is relatively more sensitive than transmission spectroscopy over an extended portion of the infrared, the use of IRS results in a better sample spectrum. The results of this study show that differentiation of crude oil samples originating both from Platform 'A' and from natural seepages in the Santa Barbara Channel is possible, based upon the presence of carbonyl and carbon monoxide-like bands observed only in the natural seepage samples. Representative examples of IRS taken for crude oils are included in the article. A discussion is also included on data treatment. (Little-Battelle)
W71-02673

THE DETERMINATION OF CYANIDE IONS IN WATERS AND EFFLUENTS BY AN AUTO-ANALYZER PROCEDURE,
P. Casapieri, R. Scott, and E. A. Simpson.
Analytica Chimica Acta, Vol 49, p 188-192, January 1970. 1 fig, 4 tab, 7 ref.

Descriptors: *Automation, *Effluents, *Colorimetry, *Waste water (Pollution), *Sewage effluents, Trace elements.
Identifiers: *Auto-Analyzer, *Cyanide, Interference, Aldridge method.

After a review of analytical methods for cyanide determination, the conclusion was reached that the most satisfactory colorimetric procedure is the Aldridge method which is based on the Koenig synthesis. In this procedure, cyanide is brominated to cyanogen bromide, excessive bromine is removed by a reductant, and cyanogen bromide is coupled with pyridine and an aromatic amine to give a colored complex. In order to handle large numbers of samples, this method was adapted for use with the Auto-Analyzer. An important feature of the procedure is the distillation stage, which not only improves the selectivity of the method, but also eliminates the necessity of filtering samples containing particulate matter. The distillation stage is designed to give a sample rate of 40 samples/h. Analysis of 1000 water samples (mostly trade effluents) by manual methods and by using the Auto-Analyzer showed excellent correlation between the results. The range of 0.5 to 10 p.p.m. of cyanide ions was of primary interest, but it was found that Beer's law was obeyed up to 40 p.p.m. of cyanide without any change within the system. Tables are included which show the results of the tests as well as interferences that result from lead, nickel, copper, mercury, cyanate, thiocyanate, thiosulfate, bisulfite, nitrite, hypochlorite, formaldehyde, and phenol ions. (Little-Battelle)
W71-02674

FAST-RESPONSE OXYGEN SENSOR TESTED.

Commercial Fisheries Review, Vol 32, No 2, p 22-23, February 1970. 1 tab.

Descriptors: *Dissolved oxygen, *Dissolved oxygen analyzers, *Sea water, Nansen bottles, Water quality, Water analysis.

Ocean oxygen measurements conducted by a civilian oceanographer of the U. S. Naval Oceanographic Office indicate that a new oxygen sensor may replace the old Nansen bottle method. The new sensor is a one-step method which can provide continuous oxygen measurements while it is being lowered through various ocean depths. The sensor produces an electrical signal which is transmitted up through an oceanographic cable to the ship. A sample chart shows the levels of dissolved oxygen at various steps determined during one of the preliminary tests. (Little-Battelle)
W71-02676

MEASUREMENT AND SIGNIFICANCE OF ADENOSINE TRIPHOSPHATE IN ACTIVATED SLUDGE,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
James W. Patterson, Patrick L. Brezonik, and Hugh D. Putnam.
Environmental Science and Technology, Vol 4, No 7, p 569-575, July 1970. 10 fig, 1 tab, 26 ref.

Descriptors: *Activated sludge, *Biomass, *Metabolism, *Inhibitors, Separation techniques, Spectrometers, Toxicity, Heavy metals, Hydrogen ion concentration, Enzymes.
Identifiers: *Adenosine triphosphate, Luciferin, Luciferase, Mercury, Enzymatic inhibitors.

A method of adenosine triphosphate (ATP) measurement in activated sludge has been developed from the firefly reaction of luciferin and luciferase with ATP, in which light production is proportional to ATP present. The purpose of the measurements was to utilize this parameter as a measure of metabolic activity and/or biomass. The ATP was extracted from the sludge by diluting it with 40 ml of boiling tris buffer and boiling it in a water bath for 10 minutes with occasional shaking. The ATP extracted was mixed with firefly tail extract, and the light emitted was measured by liquid scintillation spectrometer. A number of tests were conducted to determine the effect of temperature of ATP extraction, age and concentration of the reconstituted firefly lantern extract, and the presence of enzymatic inhibitors in the extracted samples. The technique has proved to be sensitive and reliable for quantitative determination of cellular ATP pool. ATP levels in activated sludge are relatively constant under endogenous conditions, indicating the potential of ATP as an estimate of viable biomass and respond rapidly to induced changes in metabolic activity. Advantages of an activity parameter over historically used biomass parameters for activated sludge operation control are manifold; ATP assay holds promise as a sensitive tool for future research on sludge activity in process control. (Little-Battelle)

POLYCHLORINATED BIPHENYLS,
David B. Peakall, and Jeffrey L. Lincer.
BioScience, Vol 20, No 17, p 958-964, September 1, 1970. 1 fig, 2 tab, 62 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Food chains, *Pesticide toxicity, Physical properties, Chemical analysis, Persistence, Absorption, DDT, Chemical properties, Plastics, Paints, Rubber, Resins, Gas chromatography, Spectrophotometry, Mallard duck, Poultry, Songbirds, Wading birds, Mussels, Herrings, Path of pollutants, Water pollution sources, Water pollution effects.
Identifiers: *Biological magnification, *Aroclors, *Polychlorinated biphenyls, Chemical structure.

The structural and physical properties, uses, analytical methods, toxicology, levels in nature, and biological magnification of PCBs, and the ratio of DDT to PCB in the environment are summarized. Although nothing is known about the biological decomposition of PCBs, it is likely that they are more stable than DDT and its metabolites and thus have a tendency to accumulate up the food chain. No figures on the amount of these materials produced annually are available. Analysis of PCBs has been carried out by means of a combination of high resolution gas chromatography and mass spectrometry. Nitration and saponification have been used to separate PCBs from other residues for analysis. Although several studies have been carried out on the toxicology of PCBs, toxic levels are still largely undefined. Studies have shown, however, that there are striking alternations in the internal organs of some mammals and birds. Data taken from several studies indicate that the PCBs are capable of biological magnification of the food chain. Because of the apparent danger of these materials it is necessary to discover the major sources of their escape into the environment. Sixty-two references have been cited in this summary. SEPARATION OF PHENOLIC COMPOUNDS FROM CARBON CHLOROFORM EXTRACT FOR INDIVIDUAL CHROMATOGRAPHIC IDENTIFICATION AND MEASUREMENT,
James W. Eichelberger, Ronald C. Dressman, and James E. Longbottom.
Environmental Science and Technology, Vol 4, No 7, p 576-578, July 1970. 1 fig, 2 tab, 4 ref.

Descriptors: *Phenols, *Chemical analysis, *Separation techniques, Solvent extractions, Gas chromatography.
Identifiers: *Alkyl phenols, *Chlorophenols, *Aminophenols.

A procedure is presented for efficient isolation of many phenols from carbon chloroform extracts (CCE) prior to chromatographic identification. The phenols, as weak acids, are isolated by a Florisil column cleanup of the CCE. Techniques for evaporation and preparation of the extract are given. Application of the method to grab samples as well as qualitative and quantitative determinations are discussed. Recovery data and relative retention times for a gas-liquid chromatographic separation are reported. (Little-Battelle)
W71-02680

IMPACT OF AGRICULTURAL POLLUTANTS ON WATER USES,
Robert S. Kerr Water Research Center, Ada, Okla.
James P. Law, Jr., and Harold Bernard.
Transactions at the American Society of Agricultural Engineers, Volume 13, No 4, p 474-478, July-August 1970. 3 tab, 23 ref.

Descriptors: *Farm wastes, *Irrigation, *Salinity, *Pollutants, *Fertilizers, *Water pollution sources, Biochemical oxygen demand, Chemical oxygen demand, Disposal, Livestock, Agricultural chemicals, Aquatic life, Water quality, Fish, Dissolved oxygen, Aesthetics, Recreation, Pollutant identification.
Identifiers: *Agricultural pollutants, *Aesthetic value, Total salt, Primary contact recreation, Secondary contact recreation.

This paper discussed the water pollution potential of agricultural sources. Animal wastes, irrigation return flows, fertilizer application, and pesticides are the primary sources of agricultural pollutants. The water-quality criteria for water supplies are discussed as related to agricultural contaminants. Data is presented for the desirable and permissible limits of concentration for the various contaminants. Agricultural is responsible for a major portion of the total salt in many rivers and streams. Data is given for the proposed safe limits of water salinity for livestock. The impact that agricultural pollutants has on fish, other aquatic life, and wildlife is discussed. Examples are cited where pollutants have adversely affected fish and wildlife. Now is the time to build the cost of clean water into all of our operations. (Christenbury-Iowa State)
W71-02687

IDENTIFICATION OF GASES IN A CONFINEMENT SWINE BUILDING ATMOSPHERE,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
J. A. Merkel, T. E. Hazen, and J. R. Miner.
Transactions of the American Society of Agricultural Engineers, Vol 12, No 3, 1969, p 310-313 and 315. 5 fig, 1 tab, 11 ref.

Descriptors: *Farm wastes, *Hogs, *Odor, *Gases, Confinement pens, Sulfur compounds, Ammonia, Amino acids, Porteins, Carbohydrates, Lipids, Organic acids, Solubility, Hydrogen ion concentration, Chromatography, Alcohols, Sulfides, Salting, Absorption, Condensation, Pollutant identification.
Identifiers: Acid-forming, Methane-producing, Manure storage pit, Amides, Amines, Carbonyls, Esters, Mercaptans.

In addition to the already known fixed gases, CO2, CO, H2S, NH3, CH4, etc., the environment within a confinement swine unit was found to contain a complex mixture of volatile organic intermediates. These intermediates are important in the characteristic odor resulting from the storage of manure and are suspected as being important in animal and building performance. Consideration of physical as well as organic, biochemical phenomena indicated that the important intermediate products of anaerobic manure decomposition include organic acids, amines, amides, alcohols, carbonyls and sulfides. Qualitative chemical analysis confirmed the presence of these homologous groups, except for organic acids that were decomposed upon formation by the high pH maintained within the manure storage pit. To identify individual compounds within the swine environment, concentration of the volatile gases was required. Selective absorption, liquid salting and selective condensation were each used in an effort to separate and concentrate the homologous series. Once separated, the series were subjected to chromatographic analysis for separation and identification. Physiological odor investigations have been conducted to indicate the important compounds in the specific odors in swine buildings. Work to date indicates that the major odor constituents are from the amine and sulfide groups. Further work is under way to separate these compounds. (White-Iowa State)
W71-02692

SEEK DATA IN FEEDLOT RESEARCH.
South Dakota State Univ., Brookings.

South Dakota Farm and Home Research. Vol XXI, No 2, Spring 1970, p 22-27. 2 tab, 8 fig.

Descriptors: *Farm wastes, *South Dakota, *Design criteria, Cattle fertilizers, Biochemical oxygen demand, Water pollution.
Identifiers: *Feedlots, *Farm terraces, Population equivalents, Constituents.

This is a preliminary report of research aimed at coming up with information that can be used by livestock producers, governmental agencies and persons concerned with commercial feedlot design and construction. Some advantageous conditions for feedlot expansion in South Dakota are discussed. Pollution constituents in animal waste and runoff quantities are considered in making some general recommendations as to the design or layout at a feedlot. Six sketches are utilized in presenting some do's and don't's in feedlot design. (Christenbury-Iowa State)

WILSCHWITZ RUNOFF SAMPLER,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
S. A. Witzel, J. T. Wilke, and F. L. Schmitz.
Transactions of the American Society of Agricultural Engineers, Vol 11, No 6, 1968, p 883, 886. 3 fig, 1 ref.

Descriptors: *Runoff, *Nutrients, *Sampling, Farm wastes, Weirs, Nitrogen, Phosphorus, Potassium, Water levels, Pollutant identification.
Identifiers: Prediction equations, Wilschwitz sampler, Water stage recorder.

The sampler was developed for the purpose of automatic collection of water samples from the flood runoff of small watersheds. It was intended to be used for measuring plant nutrient contained in runoff and not for determining suspended sediment loads. The installation of the Wilschwitz sampler in conjunction with a weir and water stage recorder provides an inexpensive means of obtaining runoff samples at various stages. The unique feature of the sampler is that it operates without auxiliary power. Details of the sampler's construction and operation are given in the article. Data gathered with this sampler are to be used in developing prediction equations relating the rates and amounts of runoff to the plant nutrients lost. If such correlations can be made, equations may be programmed to estimate amounts of nitrogen, phosphorus, potassium or other elements that may be anticipated in the surface water runoff. (White-Iowa State)
W71-02695

MOISTURE INCREASES MANURE ODORS,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
D. C. Ludington, and A. T. Sabel.
Poultry Digest, September 1970, p 445-446. 1 fig, 2 tab, 1 pic.

Descriptors: *Farm wastes, *Odors, Air pollution, Poultry, Ammonia, Hydrogen sulfide, Waste dilution, Chromtography, Organic acids, Pollutant identification.
Identifiers: Masking agents, Counteractants, Deodorants, Organoleptic test.

Studies of handling livestock wastes have shown that increased dilution facilitates faster settling of manure solids; thus requiring constant agitation for efficient removal of solids. Despite some apparent handling advantages of diluted animal wastes, other considerations such as lack of odor control, quantity of material to be handled, availability of water for dilution, and certain pollution may combine to preclude handling as liquid waste. Odor strengths of animal manures have been measured using liquid dilution and vapor dilution. Agitation of liquid manure causes odors to be released and their strength to increase rapidly. A combination of gas chromotographic and organoleptic techniques have been used to determine the chemical compounds responsible for the offensive odor of accumulated liquid poultry manure. Organoleptic tests indicate that the organic acids, mercaptans and sulfides are especially important malodorous components, in addition to the odorous gases ammonia and hydrogen sulfide. An organoleptic test was developed for evaluating over 40 commercial odor control products to use with liquid waste. Masking agents and counteractants were found to be the most effective. The better procedure for controlling air pollution is to prevent the formation of odors rather than attempt to control. A manure-handling system that incorporates moisture removal apparently has some merit. (White-Iowa State)
W71-02699

MEASUREMENT OF THE ODOR STRENGTH OF ANIMAL MANURES,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
A. T. Sobel.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 260-270. 6 fig, 4 tab, 10 ref.

Descriptors: *Farm wastes, *Odor, Poultry, Anaerobic conditions, Pollutant identification, Waste water treatment.
Identifiers: *Vapor dilution, *Threshold Odor Number, *Odor Intensity Index, Liquid dilution, Panel, Batch condition, Odor strength, Ranking.

Strength is a characteristic of an odor that can be measured. In contrast to characteristics such as quality and occurrence which rely only on individual opinion, strength allows associating a number with an odor. This can be very valuable for comparing manure handling systems as to odor production. Measurement of odor strength is usually accomplished by determining the magnitude of dilution required so that the odor is just detectable (olfactory threshold). The human nose is utilized as the detector. The application of the measurement of odor strength to animal manures was attempted in the laboratory. The method of liquid dilution and the method of vapor dilution were investigated. Vapor dilution looks at the odors arising from the manure while liquid dilution is concerned with the odors in the manure or the odor potential of the manure. Fifteen conclusions and observations were made as a result of the study. (White-Iowa State)
W71-02733

TYPICAL VARIATIONS ENCOUNTERED IN THE MEASUREMENT OF OXYGEN DEMAND OF ANIMAL WASTES,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
E. Paul Taiganides, and Richard K. White.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 327-335. 2 tab, 7 fig, 9 ref.

Descriptors: *Farm wastes, *Biochemical oxygen demand, *Oxygen demand, Temperature, Hogs, Cattle, Poultry, Sheep, Pollutant identification, Waste water treatment.
Identifiers: *Warburg, *Sewage Seeding, *BOD oxygen probe, Dilution effects.

Tables and figures were presented to emphasize the inherent variability in the parameters used in measuring oxygen demand. Reliable values of oxygen demand are essential because they are used as design parameters in waste treatment plants. Past and present experiments are being done with large numbers of replicates for each experiment to determine a reliable range of values for the various oxygen demand parameters of animal wastes. BOD was expressed in milligrams of oxygen required per gram of total solid matter (mg O2/g TS) since values reported in ppm or mg/l are useless because of the large variability in solid content of the waste and the high dilutions needed for the BOD test. Three methods of determining the BOD of animal waste were tested. These were the standard test, the BOD oxygen probe and Warburg. Effects of temperature and seeding with sewage were also explored. (White-Iowa State)

TRITIUM IN STREAMS IN THE UNITED STATES, 1961-1968,
Geological Survey, Wash., D.C.; Weather Bureau, Silver Spring, Md. Office of Hydrology; and Massachusetts Univ., Amherst. Coll. of Agriculture.
T. A. Wyerman, R. K. Farnsworth, and G. L. Stewart.
Radiological Health Data and Reports, Vol 11, No 9, p 421-439, September 1970. 19 p, 2 fig, 20 tab, 10 ref.

Descriptors: *Tritium, *Streams, *United States, Data collections, Analysis, Artificial use, Nuclear explosions, Sampling, Precipitation (Atmospheric), Hydrologic cycle, Streamflow, Flow rates, Rivers, Methodology.
Identifiers: *Artificial tritium input, Tritium concentrations.

As part of its program of water resources investigations, the U. S. Geological Survey has been analyzing the tritium content of stream water since the early 1960's. The results of this sampling program for 20 streams in the conterminous United States and Alaska are tabulated along with relevant stream discharge data. The data show the effect on stream tritium concentration caused principally by thermonuclear detonations, and also seasonal, latitudinal, and continental effects. The Colorado River at Cisco, Utah, and most of the other sampled rivers reached their maximum tritium levels in 1963-1964, whereas the Colorado River near Yuma, Ariz., did not reach its highest level until 1966-1967. About a year after the maximum tritium concentration was reached in the Mississippi River, the concentration in the river at Luling, La., began to approximate about half the concentration near Anoka, Minn. The Yukon River carried the highest concentration derived from precipitation, whereas the Kissimee River had the lowest. Although their basins adjoin, the Potomac River had tritium levels significantly lower than the Ohio River. (Woodard-USGS)

LAKE STRATIFICATION CAUSED BY RUNOFF FROM STREET DEICING,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
John H. Judd.
Water Research, Vol 4, No 8, p 521-532, August 1970. 12 p, 3 fig, 6 tab, 16 ref.

Descriptors: *Density stratification, *Lakes, *Saline water, *Mixing, *Michigan, Water pollution sources, Path of pollutants, Deicers, Melting, Snow removal, Water quailty.
Identifiers: *Street deicing, *Street salting.

Salt is used for winter street deicing throughout most of the northern United States. Much of the salt is dissolved in the melt water and flows into surrounding surface water. Salt entering First Sister Lake, Michigan increased the density of the water in the lower lake strata. During 2 of the 3 yr studied, the increased density prevented complete spring overturn. This can be considered a temporary monomixis. The stability of stratification of the lake was computed. Stability was from 3.5 to 8.5 times greater than when no complete overturn occurred at other times. The lake mixed competely each fall. Laboratory and field tests indicate that salt left the lake and apparently entered the groundwater of the area. Dichtothermic conditions were found in the lake. Density determinations indicated that this was an unstable condition, probably of short duration. (Knapp-USGS)

THE COOLING OF RIVERSIDE THERMAL-POWER PLANTS,
Electricite de France, Paris.
Andre Goubet.
In: Engineering Aspects of Thermal Pollution, Chapter 4, p 110-123, 1969. 4 fig, 3 tab.

Descriptors: *Cooling, *Thermal pollution, Thermal power, Heat budget, Heat balance, Temperature, Mixing, Rivers.
Identifiers: France.

Three rivers were investigated in France as to their cooling ability of thermal discharges. For cooling computation, the following formula was used: T sub 2 — T sub 1 exp (-kLx/Q) where T sub 1 and T sub 2 are the excess over the equilibrium temperature in two sections of a canal (or river) a distance of x apart, L is the width of the canal, Q is the rate of flow. Recommended value of k (which may vary with meteorological conditions) is k — .000013. The measurements made in France provided the following major conclusions: (1) the mingling of warm and cold water downstream from a plant is a slow process which takes several kilometers before a nearly homogenous rise is obtained, (2) temperature increase resulting from passage through the condensers is almost always less than 8C. The ways of future research is discussed. (See also W71-02478) (Novotny-Vanderbilt)
W71-02481

DISCUSSION OF 'MECHANICS OF CONDENSER WATER DISCHARGE FROM THERMAL POWER PLANTS' BY D. R. HARLEMAN,
California Inst. of Tech., Pasadena. Dept. of Civil Engineering.
Norman H. Brooks.
In: Engineering Aspects of Thermal Pollution, p 165-172, 1969. 6 fig, 8 ref.

Descriptors: *Water cooling, *Mixing, *Heat transfer, Water pollution sources, Hydraulic design, Outlets, Thermal pollution.

The purpose of this discussion was to point out the possibility of making hydraulic designs for cooling water discharges considering all possible ranges between surface spreading of hot water with minimal mixing and extensive jet mixing of the effluent with the receiving water and with possible storage of waste heat below thermoclines. The different problems in each case are presented and some conclusions are: (a) The alternatives elected in the hydraulic design of outlet structures will certainly depend on the predicted ecological effects of managing the waste heat in different ways. The strong-mixing approach can be expected to be most useful in ocean or in reservoirs and estuaries in which there are substantial currents to carry away the waste heat from the plant site. In small bodies of water, or those without substantial currents, surface spreading will probably be more effective. (b) It is necessary to develop power generation methods which are more efficient and produce less waste heat per unit of power generated. (c) It is recommended to use the metric system of units in all calculations of heat transfer and energy. (See also W71-02478) (Guerrero-Vanderbilt)
W71-02483

MODELING OF HEATED WATER DISCHARGES,
Hydraulic Research Station, Wallingford (England).
Peter Ackers.
In: Engineering Aspects of Thermal Pollution, Chapter 6, p 177-212, 1969. 18 fig, 24 ref.

Descriptors: *Model studies, *Hydraulic similitude, Effluents, Buoyancy, Diffusion, Turbulence, Thermal pollution.
Identifiers: Heat exchange.

The purpose of this paper was to outline some of the more practical aspects of the modeling of buoyant effluents, including a comparison of model and prototype observations in several situations. The main stages of dispersion with their scale relationships are outlined such as jet diffusion, buoyant plume, convective spread, mass transport by ambient currents, ambient turbulence and surface cooling. A comparison between field studies and model results were made in several models: Severn Estuary model, Black Rock outfall/intake model, Power stations and Desalination plant in Hong Kong, Ringsend and Pigeon House Power station in Dublin, Longannet Power Station on the Forth Estuary in Scotland, and proposed 2,400 MW station at Heysham in Lancashire, covering a wide variety of situations. The underlying principles and some of the special equipment used for field surveys at the Hydraulic Research Station, Wallingford, Berks, are presented. Conclusions were: (a) Hydraulic model techniques must be supported by adequate field surveys and its limitations must be realized. Some of the imperfections of modeling are inseparable, but continued research on densimetric and turbulent processes must help to improve the interpretation of scale-model results. (b) The model-prototype comparisons that have been given show that reasonably good agreement is possible, although there remains the problem of the representation of initial mixing zones in vertically exaggerated models. The use of two models, one being a large scale local one of the immediate locality of the outfall, is therefore often advisable. (c) Expenditure in field surveys may form an appreciable proportion of total investigation costs. (d) Infrared techniques are promising in survey methods

in model as well as in prototypes. (See also W71-02478) (Guerrero,Vanderbilt)
W71-02484

DISCUSSION OF 'MODELING OF HEATED DISCHARGES' BY PETER ACKERS,
Tennessee Valley Authority, Norris. Engineering Lab.
Edward E. Driver, and Rex A. Elder.
In: Engineering Aspects of Thermal Pollution, p 213-221, 1969. 3 ref, 2 fig.

Descriptors: *Model studies, *Hydraulic similitude, Outlets, Thermal pollution.
Identifiers: Heat exchange.

A discussion on mass transport by ambient currents and roughness relationship is made and also the simulation of heat exchange with the environment is analyzed, pointing out the implications involved in surface cooling simulation. It is remarked that existing analytic techniques serve to provide a basis for a preliminary estimate of the requirements for a condenser water intake and outlet system; but to insure a proper design, model studies in most cases will be necessary. A brief description of a model study of the condenser water discharge canal for the Cumberland Steam Plant, currently being conducted at the Tennessee Valley Authority's Engineering Laboratory is presented. Three problem areas were identified: (1) The rapidly divergent transition at the upstream end of the discharge canal did not distribute the flow properly, (2) flow separation occurred at the bend, and (3) undesirable mixing occurred near the mouth of the canal. To determine the effect of the transition on the problems, a baffle was installed but it did not alleviate these undesirable conditions. Considerable work remains to be done to determine the best configuration for the discharge canal. (See also W71-02478) (Guerrero-Vanderbilt)

ENGINEERING ASPECTS, SOURCES, AND MAGNITUDE OF THERMAL POLLUTION,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
Peter A. Krenkel, and Frank L. Parker.
In: Biological Aspects of Thermal Pollution, Chapter 12, p 10-72, 1969. 28 fig, 5 tab, 32 ref.

Descriptors: *Thermal pollution, Stratification, Water quality, Dissolved oxygen, Iron, Manganese, Power plants, Cooling water, Waste assimilative capacity, Cooling towers, Temperature.
Identifiers: Dry cooling towers.

A general survey is conducted of the engineering aspects of thermal pollution. It describes thermal stratification in impounded waters and the effects of stratification on water quality, discussing in particular the dissolved oxygen balance, iron and manganese, and temperature. The overflow versus completely mixed heated discharges are compared and advantages of each are discussed. Also treated are heat additions from power plants; future cooling water requirements; fluctuating discharges of heated water; effects of heated discharges on waste assimilation; mechanisms for the dissipation of heat; the energy balance and its components; alternative methods for cooling water, such as cooling pond, spray pond, atmospheric towers, hyperbolic towers, mechanical draft towers, and dry cooling towers; the problems with cooling towers, and their cost. Addition of too much heat, either natural or artificial, causes adverse effects on water quality. It will be expensive to cool heated condenser water to its original temperature, but it can be done. A DISPERSION MODEL FOR HEATED EFFLUENT FROM AN OCEAN OUTFALL,
Naval Postgraduate School, Monterey, Calif.
Richard Charles Baldwin.
Available from NTIS as AD-710 730, $3.00 in paper copy, $0.95 in microfiche. Master's Thesis, April 1970. 58 p, 13 fig, 3 tab, 28 ref.
Identifiers: *Sea water, Heat transfer, *Wastes (Industrial), Disposal, *Power plants (Establishments), Heat, Cooling, Two-dimensional flow, Mathematical models, Fluid flow, Surface temperatures, Pacific Ocean, Theses, Heat budget, Heat sinks, *Huntington Beach (Calif), *Thermal pollution.

A mathematical model is developed for dispersion of a heated effluent from an ocean outfall. Input parameters include atmospheric and oceanic conditions and discharge characteristics. The model solves the steady-state, two-dimensional differential equation for non-conservative diffusion of heat in a moving fluid. The solution is calibrated and verified using data from surveys conducted at the Southern California Edison Company power plant at Huntington Beach, California. Temperature fields predicted by the model are compared with the actual fields for seven different surveys. These comparisons indicate that the model can be used to predict the large scale influence of the outfall on the local ocean environment.

SOME CAUSES OF WET POULTRY MANURE,
Georgia Univ., Athens.
O. W. Charles.
Georgia Poultry Tips, August 1, 1970. Poultry Digest, September 1970, p 431.

Descriptors: *Farm wastes, *Poultry, *Moisture content, Water consumption, Strain, Salts, Carbohydrates, Lipids, Proteins, Water pollution sources.
Identifiers: *Ration, Water intake, Uric acid.

Excessive moisture in poultry manure may be due to a number of factors, among which is a tendency for certain strains of birds to produce higher percentage of moisture in the fecal material than other strains. Water represents by far the largest portion of fresh poultry manure. Reports of several researchers are cited as to moisture content and differences in strain. It was found that moisture content of the droppings of low water consuming strains was only 50%, while moisture content of droppings in the high water consuming strain reached 71%. Excessive amounts of salt and a concept of balance in the ration are also discussed as causes of excessive moisture. (White-Iowa State)

THE NITROGEN PROBLEM IN THE LAND DISPOSAL OF LIQUID MANURE,
Guelph Univ. (Ontario). Dept. of Soil Science.
L. R. Webber, and T. H. Lane.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 124-130. 3 tab, 1 fig, 13 ref.

Descriptors: *Farm wastes, *Nitrogen, *Groundwater, Nitrates, Water pollution sources, Waste water treatment.
Identifiers: *Nitrogen pollution, Crop utilization, Pollution control.

Segments of research are presented that lead to the preparation of guidelines outlining the cropland requirements for the utilization and disposal of the nitrogenous compounds in liquid manures. The objective in land spreading was two-fold: (a) to apply the waste at such rates that the practice will be nitrogen utilization for crop production at optimum use-efficiency; and (b) to apply the waste at such rates that the practice becomes primarily one of disposal while not contributing to environmental pollution (air, water, soil). Tables show the different rates of application and how the nitrogen is removed. Recommendations are given as to how much land is required for crop utilization and pollution control for different livestock operations. (White-Iowa State)

WASTE DISPOSAL MANAGEMENT,
Cornell Univ., Ithaca, N.Y.
Charles E. Ostrander.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 242-244.

Descriptors: *Farm wastes, Nitrogen, Mortality, Water pollution effects, Incineration, Storage, Odor, Disposal, Water pollution sources.
Identifiers: Compost, Nuisance, Pollution hazard, Residential areas, Neighbors.

The immediate concern of the author was the improvement and the prevention of further destruction of our environment. He spoke of the magnitude of the agricultural waste problem indicating the greatness of the technological and economic aspects. The importance of animal waste as a source of organic nitrogen was pointed out, as were the dangers of inorganic nitrogen. Methods of handling and storage were brought out. The problem of disposing of mortality cases and possible solutions was discussed. Stress was placed on the creation of a favorable image of agriculture in the eyes of the public. (White-Iowa State)

ROLE OF EXCRETED ANTIBIOTIC IN MODIFYING MICROBIAL DECOMPOSITION OF FEEDLOT WASTE,
Colorado State Univ., Fort Collins. Dept. of Microbiology.

S. M. Morrison, D. W. Grant, Sister M. P. Nevins, and Keith Elmund.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 336-339. 1 tab, 2 ref.

Descriptors: *Farm wastes, *Antibiotics, Cultures, Cattle, Confinement pens, Biodegradation, Pesticide residues, Assay, Water pollution sources.
Identifiers: *Chlortetracycline, *Biological stabilization, Feedlot, Manure decomposition, Microbial decomposition, In situ manure.

The results presented in this paper are derived from studies on the process of biological stabilization of feedlot manure and the acceleration of the stabilization process. It is a specific study on some microbial inhibitions which may be playing a role in the biodegradation of feedlot waste. Samples of manure were taken from pasture, in situ manure from feedlot pens, and stockpiled manure from a feedlot. Cultures of the filter-sterilized manure extract gave rather conclusive evidence that the substance causing growth inhibition in the extracts was chlortetracycline residue in the excreted manure. It was calculated that 75% of the ingested antibiotic was excreted in the feces. Temperature tests indicate that during the winter months biodegradation of manure is not only inhibited by cold temperatures but also by the persistence of the antibiotic residue and the continuous deposition of antibiotic containing fresh manure. OIL POLLUTION OF THE OCEAN,
Woods Hole Oceanographic Institution, Mass.
M. Blumer.
In: Oil on the Sea, New York, 1969, p 5-13. 1 fig, 10 ref. FWQA Project 18050 EBN.

Descriptors: *Oily water, *Water pollution effects, *Water pollution sources, Water pollution treatment, Sea water, *Oil wastes, Oil, Pollutant identification, Toxicity, Water pollution control.
Identifiers: Oil pollution, Oil spillage.

The extent of oil pollution of the seas is discussed on a world-wide scale. Contribution from shipping losses alone is estimated at 10 to the 12th power grams per year. The relative toxicities of various oil fractions to marine organisms are discussed and the potential for subtle long-term effects is emphasized. Oil mass identification and the potential biological effects of several oil spill countermeasures are briefly presented. (Hegre - FWQA National Marine Water Quality Laboratory)

Identifiers: *Natural hydrocarbons, Scallop, Mass spectrometry, *Oil spillage, Oil pollution, Hydrocarbons (Aromatic), Buzzards Bay (Mass).

A spill of 650,000 to 700,000 of No. 2 fuel oil has contaminated the coastal areas of Buzzards Bay, Massachusetts (USA). Gas chromatography demonstrates the presence of this oil in the sediments of the affected area. Two months after the accident, essentially unchanged oil is still being released from the sediments. The presence of the same pollutant is demonstrated in whole oysters Crassostrea virginica and in the adductor muscle of the scallop Aequipecten irradians. A presumably biochemical modification leads to a gradual depletion of the straight chain and, to a lesser extent, of branched chain hydrocarbons. This does not result in detoxification, as the more toxic aromatic hydrocarbons are retained in the organisms several months after the accident. Scallops from an uncontaminated area contain hydrocarbons in lesser amounts and of very different molecular weight and type distribution; they are accountable entirely from biological sources. (Blumer-Woods Hole Oceanographic Institution)

Identifiers: *Echinoderms, *Starfish, Chemotaxis.

The chemical basis of the predator/prey relationship, sea stars/bivalves, was examined. Under controlled conditions in a flow-tank, Asterias vulgaris senses intact oysters (Crassostrea Virginica) upstream at distances of at least 120 cm. and shows a positive chemotaxis. It responds similarly to aqueous extracts of oyster tissue at concentrations as low as a few parts per billion. The threshold sensitivity of Asterias vulgaris and Asterias forbesi for an oyster extract was compared. It was measured also for A. vulgaris relative to other bivalves. Contamination of the testing tank with particulate suspensions and oil dispersions at concentrations of less than 10 mg/liter is sufficient to decrease the response to oyster extract and to lower the threshold sensitivity of the sea stars. A reliable, repeatable method was developed for the partial purification of the oyster extract. Infrared spectroscopy indicates that the major functional groups are -OH, -NH and -COOH. It is probable that the activity is centered in a number of polar, low molecular weight compounds (m.w. below a few hundred). They are heat stable at 100C, stable to acid, and not hydrolyzable. (K. J. Whittle-Woods Hole Oceanographic Institution)

ENGINEERING ASPECTS OF THERMAL POLLUTION.
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.

Proceedings of the National Symposium on Thermal Pollution Sponsored by Federal Water Pollution Control Administration and Vanderbilt University, Nashville, Tenn., August 14-16, 1968. Price: $7.95. Frank L. Parker and Peter A. Krenkel, Editors Vanderbilt University Press, Nashville, Tennessee, 1969. 407 p.

Descriptors: *Thermal pollution, *Thermal powerplants, *Economics, *Ecology, *Standards, *Thermal discharges, *Model studies, *Cooling towers, *Cooling water, Temperature, Aquatic environment, Legislation, Screens, Fish, Engineering.

This book is the proceedings of the National Symposium on Thermal Pollution and contains papers regarding the ecological changes of applied significance induced by the discharge of heated waters, the economic considerations in thermal discharge to streams, and several presentations dealing with the engineering aspects of thermal pollution. The cooling of riverside thermal-powerplants, the mechanics of condenser-water discharge from thermal-powerplants, the mathematical and physical modeling of heated-water discharges, and the design and operation of cooling towers were discussed in detail. The horizontal traveling screen for prevention of the entrance of fish into cooling water intake canals, and the development and administration of water quality standards for temperature were also discussed. A summary of the status of thermal pollution control and abatement is included. Each presentation includes a review of past and current research in that specific area and makes recommendations for future applied research. The concluding presentation summarizes the research needs for thermal pollution control. (See also W71-02479 thru W71-02490) (Speakman-Vanderbilt)

ECOLOGICAL CHANGES OF APPLIED SIGNIFICANCE INDUCED BY THE DISCHARGE OF HEATED WATERS,
Aston Univ., Birmingham (England). Dept. of Biological Sciences.
H. A. Hawkes.
In: Engineering Aspects of Thermal Pollution, Chapter 2, p 15-57, 1969. 4 tab, 3 fig, 84 ref.

Descriptors: *Temperature effects, *Thermal pollution, *Ecology, Algae, Bacteria, Coliforms, Fish, Fungi, Heat, Water pollution, Streams, Rivers, Lakes, Physiological ecology, Limiting factors, Ecosystems, Microorganisms, Aquatic microorganisms, Enzymes.

The general review of ecological aspects of thermal pollution is discussed. Temperature of water is an ecological factor which influences all forms of biological life in water. The minimum, optimum, and harmful temperature ranges for all kinds of biota in waters is discussed. The temperature influences the microbiological organisms by its effects on enzymes, which are inactivated at high temperatures. The most obvious effect of the raised water temperature on fish is the direct autecologi-

cal one, affecting the distribution of each species according to their temperature tolerance ranges. The optimum temperature ranges for fish are presented, and indirect effects of raised temperature on fish are discussed (decrease of oxygen level, increase of toxicity effects, etc.). The paper also discusses the temperature effects on macro-invertebrates, algae, bacteria, and fungi. (See also W71-02478) (Novotny-Vanderbilt)

THERMAL POLLUTION,
Federal Water Pollution Control Administration, Washington, D.C.
Joe G. Moore, Jr.
In: Engineering Aspects of Thermal Pollution, Chapter 8, p 243-248, 1969.

Descriptors: *Thermal pollution, *Temperature, *Cooling water.
Identifiers: Ecological effect.

Since the end of World War II, construction of scores of new power-generating plants has resulted in a growing public concern about hot water. The sudden rise in public awareness has far outstripped our knowledge of the ecological effects of large discharges of heated water in our rivers, lakes and estuaries. It is estimated that by 1978 approximately one-sixth of the total fresh water run-off in the United States will be used for cooling and consdensing purposes. The cooling water requirements for the nuclear power facility at Browns Ferry, Alabama, on the Wheeler Reservoir will be 2.8 billion-gallons per day. The temperature increase in the cooling-water, from intake to discharge, will zoom 25F in six minutes. The use of diffuser pipes at the bottom of the reservoir is proposed for disposal of this water. Another example is the Turkey Point facility, which will increase its cooling water requirement from 192 million gallons now to 3.15 billion gallons per day by 1972. There is already evidence of a substantial temperature increase in Biscayne Bay, a national treasure. What will happen when cooling water volume is increased more than 16-fold is unknown. The effective methods of control of waste heat are cooling towers, dilution of waste heat, use of aerated ponds, recycling of condenser water and operating the plant at minimal level during periods when addition of heat would be more hazardous. BIOLOGICAL ASPECTS OF THERMAL POLLUTION.
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.

Proceedings of the National Symposium on Thermal Pollution, Sponsored by the Federal Water Pollution Control Administration and Vanderbilt University, Portland, Oregon, June 3-5, 1968, Price: $7.95. Peter A. Krenkel and Frank L. Parker, editors, Vanderbilt University Press, Nashville, 1969. 351 p.

Descriptors: *Thermal pollution, *Thermal powerplants, *Ecology, *Biota, *Temperature, *Aquatic environment, *Aquatic life, *Aquatic populations, Algae, Benthos, Zooplankton, Freshwater fish, Estuarine environment, Impounded waters, Freshwater algae, Anadromous fishes.

The proceedings of the National Symposium on Thermal Pollution - Biological considerations - are included in this book. A brief discussion of the engineering problems of thermal pollution includes stratification of impounded waters, the contribution of heat from power plants, cooling water requirements, natural heat dissipation mechanisms, and alternative methods for cooling water. Reports and discussions concerning the effects of thermal pollution on freshwater algae, marine zooplankton, British freshwater fishes, Anadromous fishes, and freshwater benthos are presented. The development of thermal requirements of freshwater fishes, theoretical considerations of thermal pollution on marine fishes at various life stages, and the potential effect of thermal alteration on marine and estuarine benthos are also discussed. Most presentations include reviews of past and current literature and recommendations, and the final presentation deals exclusively with research needs for thermal pollution. REMARKS ON THE EFFECTS OF HEATED DISCHARGES ON MARINE ZOOPLANKTON,
Scripps Institution of Oceanography, La Jolla, Calif.
J. B. Strickland.
In: Biological Aspects of Thermal Pollution, Chapter 3, p 73-77, 1969.

Descriptors: *Zooplankton, *Thermal pollution, *Hydrodynamics, *Aquatic life, Food chain, Dominant organisms, Aquatic environment, Ecology, Physics, Temperature, Thermal effects.
Identifiers: *Marine environment.

To date, little is known concerning the extent of the effect on the entire food chain and its indirections and feedbacks on any particular part of it. Although clearly more is known now than was known a decade ago, the more that is known, the more complicated and interreacting it becomes. Before meaningful predictions concerning marine zooplankton can be made, much more about the physics and hydrodynamics of the discharge process must be known. Not enought is known about the kinetics of the remineralization process. The basic problem is marine and probably freshwater ecology is one of manpower; the training of enough people of sufficient caliber to make intelligent predictions about the results of thermal pollution in the environment is not progressing fast enough. ASPECTS OF THE POTENTIAL EFFECT OF THERMAL ALTERATION ON MARINE AND ESTUARINE BENTHOS,
Oregon State Univ., Newport. Yaquina Bilogical Lab.
Joel W. Hedgpeth, and Jefferson J. Gonor.
In: Biological Aspects of Thermal Pollution, Chapter 4, p 80-118, 1969. 7 fig, 1 tab, 91 ref.

Descriptors: *Benthos, *Temperature, *Thermal pollution, Laboratory animals, Acclimatization, Marine animals, Aquatic life, Aquatic animals, Benthic fauna, Aquatic plants, Marine algae, Benthic flora, Estuaries, *Estuarine environment, Bays, *Fluctuation, Resistance, Life cycles, Growth stages.
Identifiers: Temperature ranges, Temperature requirements.

Laboratory experiments on thermal tolerances, death points, and the life, without reference to the natural conditions, including previous temperature experience and state of tide or season at which experimental material was gathered, have questionable utility in reference to what the organisms may actually do in nature. Intensive field studies with in situ measurements of the environment and the organisms, combined with continuous monitoring, especially of thermal gradients, are needed. Field evidence indicates that some intertidal herbivores are well adjusted to the temperature ranges from seawater to rather high air temperatures for varying periods of time, and that indeed such a temperature range may be an ecological requirement, rather than an environment to be endured. How extensive this may be, and to what degree it may apply also to subtidal organisms, remains to be determined. There is evidence indicating that some marine organisms do not flourish in a stable temperature regime but require the variation around the statistical mean. However, such temperature requirements are not yet established for many organisms, since most experiments involving laboratory culture are of comparatively short duration. In contrast to the observed ability of many marine organisms to withstand wide ranges of environmental temperatures at some stages of their life cycles, there is the growing body of evidence that comparatively small fluctuations in oceanic temperatures may influence the distribution and abundance of many species, especially those that occur in large populations. DEVELOPING THERMAL REQUIREMENTS FOR FRESHWATER FISHES,
Federal Water Pollution Control Administration, Duluth, Minn.
Donald I. Mount.
In: Biological Aspects of Thermal Pollution, Chapter 6, p 140-147, 1969.

Descriptors: *Temperature, *Fish, Thermal pollution, Fish food organisms, Food chains, Growth rates, Reproduction.
Identifiers: *National Water-Quality Laboratory, *Thermal requirements, Harvestable species, Temperature fluctuations.

The research undertaken at the National Water-Quality Laboratory is being concentrated on developing thermal requirements of the harvestable aquatic species (shell- and fin-fishes) and the critical food-chain organisms on which they feed. The two primary functions which cannot be altered if a satisfactory crop of fish is to be maintained are reproduction and growth. Therefore, research is now centered around determination of maximum temperatures at which normal growth and reproduction can occur without impairment; the extent to which temperatures may fluctuate without interfering with growth and reproduction; and whether cooler temperatures are necessary for reproduction to occur. Field study sites at the St. Croix River in Minnesota and at the Mississippi River at Monticello, Minnesota, are being used to study maximum temperatures at which some critical species will spawn and grow normally, and to study the effects of elevated temperatures on critical food-chain organisms respectively. SOME EFFECTS OF TEMPERATURE ON FRESHWATER ALGAE,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
Ruth Patrick.
In: Biological Aspects of Thermal Pollution, Chapter 7, p 161-185, 1969. 53 ref.

Descriptors: *Algae, *Temperature, Diatoms, Photosynthesis.
Identifiers: *Blue-green algae, *Green algae, *Red algae, *Temperature tolerance, Optimum growth temperature, Condenser paggage.

Most of the common freshwater algae belong to the green algae, diatoms, red algae, and blue-green algae groups. In each of these major groups there are many species. These species cover a wide range of temperatures from those that prefer cool-water conditions to those that prefer very warm water

conditions. Each species has a range of temperature that it can tolerate and a range in which its growth is optimum. In general, the blue-green algae have more species that prefer temperatures from 35C upward, whereas the green algae have a relatively large number of species that grow best in temperatures ranging up to 35C. Most diatom species prefer temperatures below 30C. The effect of artificially increasing the temperature regime of a species tends to increase growth and photosynthesis so long as light is sufficient for these functions and the limits of temperature tolerance are not reached. As one approaches the limits of temperature tolerance for a species, cell division is repressed, as is photosynthesis, and the formation of reproductive cells may be repressed. The pattern of growth may be greatly altered. The temperatures at which species may successfully grow in the laboratory may be higher than those which occur in nature because of lack of competition with other species under natural conditions and the effect of predator pressure. Studies made concerning the effect on algae of passing them through a condenser indicate that if the temperature does not exceed 34-34.5C, little, if any, harm is done. EFFECT OF HEATED DISCHARGES ON FRESHWATER FISHES IN BRITAIN,
Ministry of Agriculture, Fisheries and Food, London (England).
John S. Alabaster.
In: Biological Aspects of Thermal Pollution, Chapter 11, p 354-370, 1969. 9 fig, 6 ref.

Descriptors: *Fish, *Thermal pollution, Thermal power, Cooling, Trout, Perches, Carp, Cooling towers, Heated water, Environmental effects, Fish management, Streams, Rivers, Food chains.
Identifiers: Britain, Great Britain, *Temperature effects.

The increase in temperature of the water used by electricity-generating stations for cooling purposes is often potentially lethal during the summer to trout and to the more sensitive species of coarse fish, such as roach, perch, and gudgeon, though not to tench and carp. Coarse fish are present in most rivers receiving these heated discharges but are rarely killed even close to the effluent outfall, probably because they avoid lethal conditions which are often confined to the surface layers, and also because those fish exposed to heated water in the neighborhood of outfalls have become partially acclimated to temperatures above normal and thus become more resistant. When fish are killed, effluent temperatures are higher than normal, either because of exceptional operating conditions or intentionally for experimental purposes, but many fish apparently escape successfully. Most danger occurs near the outfalls, particularly when effluent recirculates both in the river and through cooling towers. Effluent temperatures are not always potentially level, even in summer, and may attract roach, gudgeon, carp, tench, and bream. Indirect effects of heated effluents on fish in polluted rivers are likely to be important. (See also W71-02491) (Novotny-Vanderbilt)

PHOSPHORUS, NITROGEN, AND ALGAE IN LAKE WASHINGTON AFTER DIVERSION OF SEWAGE,
Washington Univ., Seattle. Dept. of Zoology.
W. T. Edmondson.
Science, Vol 169, No 3946, p 690-691, August 14, 1970. 2 fig, 8 ref.

Descriptors: Sewage effluents, *Algae, *Phytoplankton, *Aquatic productivity, *Phosphates, *Nitrates, *Chlorophyll, Diversion, Carbon dioxide, Alkalinity, Epilimnion, Washington, Phosphorus, Nitrogen, Nutrients.
Identifiers: Lake Washington (Washington).

Because of the large amounts of phosphorus and nitrogen being added to Lake Washington from sewage effluent, a program was set up to divert all sewage from the lake. The first diversion of 11 treatment plants occurred in 1963. From 1963 to 1969, phosphate decreased to 28% of the 1963 concentration, but nitrate remained at more than 80% of the 1963 value. Free carbon dioxide and alkalinity remained relatively high. The amount of phytoplanktonic chlorophyll in the summer was very closely related to the mean winter concentration of phosphate, but not to that of nitrate or carbon dioxide. Phytoplankton counts have not been completed, but data are available on the chlorophyll content of the phytoplankton in the epilimnion. The relationship between the summer mean and the concentration of phosphate in the surface water during the previous winter strongly suggests that phosphorus is the most important limiting element in Lake Washington. Two included graphs show the mean winter values of phosphate, nitrate, chlorophyll, and surface phytoplankton; and correlation between surface values of phosphate and nitrate during the spring increase of phytoplankton when the concentrations of nutrients are decreasing. (Little-Battelle)

POLYCHLORINATED BIPHENYLS (PCB) SOLUBILIZED IN WATER BY NONIONIC SURFACTANTS FOR STUDIES OF TOXITY TO AQUATIC ANIMALS,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
V. Zitko.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 3, p 279-285, 1970. 2 fig, 1 tab, 8 ref.

Descriptors: *Atlantic salmon, *Toxicity, *Spectrophotometry, *Gas chromatography, *Absorption, *Surfactants, *Solubility, Chlorinated hydrocarbon pesticides, Solvation, Ultraviolet radiation, Fluorescence, Fishkill, Fresh water, Sea water, Bioassay, Water pollution effects.
Identifiers: *Aroclors, *Polychlorinated biphenyls.

This paper describes the solubilization of PCB in water by a nonionic surfactant, Corexit 7664; determination of concentration of the solubilized PCB by UV spectrophotometry and fluorescence; some properties of aqueous PCB solutions; and preliminary results on the toxicity of PCBs to Atlantic salmon (salmo salar) parr. The PCB preparations were Aroclor 1221 and Aroclor 1254 (containing 21% and 54% chlorine respectively). Solubilities of PCB were determined in both fresh and seawater. The toxicity tests were conducted using two flasks at each Aroclor concentration: one containing two fish, the other without fish. Initial concentrations were 0.9 and 2.5 mg/l for Aroclor 1254 and 0.9 mg/l for Aroclor 1221. The results of the tests are included in graphs. The following conclusions were made: (1) The determined levels of solubility of PCB in water were reached by very vigorous dispersing of the PCB in water, and it would be difficult to scale up this procedure. As indicated by the toxicity data, lethal levels would be reached only in the case of Aroclor 1221. (2) Solubilization of PCB in water by relatively nontoxic, nonionic surfactants is a reproducible and convenient method for dosing PCB in experiments with aquatic animals. (3) Concentration of the solubilized PCB can be readily monitored by spectrophotometry or by fluorescence at a rate of 20-30 analyses per hour; continuous monitoring is also possible. (4) There is no difference in optical properties between PCB solubilized in water by nonionic surfactants and true solutions of PCB in ethanol. (5) The preliminary tests indicate that PCB may be less toxic to Atlantic salmon parr than chlorinated hydrocarbon pesticides. (Little-Battelle)

SOIL FERTILITY UNDER CONTINUOUS CULTIVATION IN NORTHERN NIGERIA. I. THE ROLE OF ORGANIC MANURES,
R. G. Heathcote.
Experimental Agriculture. Vol 6, No 3, p 229-237, 1970. 13 tab, 14 ref.

Descriptors: *Trace elements, *Limiting factors, Farm wastes, Fertilizers, Crop response, Deficient elements.
Identifiers: Organic fertilizers, Nigeria, Organic manures.

Soil acidity, incipient potassium deficiency, and a deficiency of one or more trace elements were limiting factors in three trials of long-term soil fertility changes under continuous cultivation in the Sudan Savanna zone of Nigeria. The effectiveness of organic manures is explained largely or wholly in terms of these factors, since no evidence has yet been found to suggest that the addition of organic matter as such is of value. ENVIRONMENTAL POLLUTION--NOW AND IN THE YEARS AHEAD,
Office of Science and Technology, Washington, D.C.
Donald R. King.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 4-8, 1969.

Descriptors: *Farm wastes, *Environment, Legal aspects, Research and development, Design standards, Waste treatment, Waste disposal.
Identifiers: *Agricultural Pollution, Resource conservation, Waste uses, Land planning.

The report points out several avenues that warrant research attention; among them the following: (1) The potential benefits to control which may result from changing the character of animal wastes. (2) Information is needed on present control approaches to make them more generally applicable. (3) The tremendous volume of animal wastes produced necessitates the development and application of new and more effective treatment and disposal methods. (4) Additional attention to potential uses for animal wastes would be desirable. (5) Land use planning also warrants emphasis. (6) Additional information also will be needed on the relationships of wastes to agricultural production which can be used to assist in establishing standards. (White-Iowa State)

5D. Waste Treatment Processes

REMOVAL OF PHOSPHATE FROM WATER BY ALUMINUM AND IRON, PHASE II,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
Pa Ho Hsu.
Available from NTIS as PB-196 109, $3.00 in paper copy, $0.95 in microfiche. New Jersey Water Resources Research Institute, Technical Completion Report, December 1970. 5 p. OWRR Project A-021-NJ (1).

Descriptors: *Phosphates, Chemical precipitation, Water pollution, *Waste water treatment, Clay minerals, Aluminum, Iron compounds, Water purification.

Identifiers: *Phosphate removal, Aluminum phosphate, Iron phosphate.

Effects of foreign components on the precipitation of phosphate by aluminum and precipitation of phosphate by ion were studied. The effectiveness of hydroxy-aluminum polymers to precipitate phosphate is greatly influenced by the ratio of phosphate to aluminum and also by the nature and the concentration of the foreign componets (sulfate, fluoride, kaolinite and montmorillonite) present. Phosphate precipitation was greatly improved in some cases while reduced in others. The composition of the waste water to be treated and that of coagulants added must be taken into consideration in any laboratory study or practical process of phosphate removal from waste water. Samples were prepared by mixing Fe (NO3)3,NaH2PO4 and NaOH together and then analyzed for the concentrations of phosphate and iron remaining in solution and the composition of the precipitate. The optimum pH for phosphate precipitation greatly varies with the amount of phosphate relative to that of iron present. Phosphate forms stable soluble complexes, thus frequently causing difficulty in obtaining complete precipitation of phosphate and iron. Some irreversible or very slowly reversible steps are involved in the process of sample preparation. Therefore, for any laboratory study or practical waste water treatment, the process of mixing reactants must be carefully controlled. (Hsu-Rutgers)
W71-02272

NUTRIENT REMOVAL FROM ENRICHED WASTE EFFLUENT BY THE HYDROPONIC CULTURE OF COOL SEASON GRASSES,
Robert S. Kerr Water Research Center, Ada, Okla.
James P. Law, Jr.
Available from NTIS as PB-196 112, $0.95 in microfiche. For sale by the Superintendent of Documents, US Government Printing Office, Washington, D.C. 20402. Price $0.50, Order no I67.13/4:16080/1069. Water Pollution Control Research Series 16080---10/69, October 1969. 33 p, 13 tab, 3 fig, 10 ref. FWQA Program 16080---10/69.

Descriptors: *Hydroponics, Tertiary treatment, Waste water treatment, Grasses, Fescue, Waste assimilative capacity, Nutrients, Nitrogen, Phosphorus, *Sewage effluents, Effluents.
Identifiers: *Nutrient removal, Cool season grasses, Ryegrass, Nitrogen removal.

Grasses were grown in hydroponic culture tanks to evaluate their nutrient removal capabilities when supplied with secondary-treated sewage effluent as the sole source of plant nutrients. Statistical methods were employed to determine the effects of the grasses, flow rates, and seasons on nutrient removal. Two control tanks with gravel bed and no grass were maintained throughout the study, two were planted with tall (Ky 31) fescue, and two were planted with perennial ryegrass. Two flow rates were maintained in each pair of tanks, approximately one-day and two-day detention times. All six tanks were effective in reducing the oxygen-demanding organic content of the effluent. Total nitrogen content was reduced appreciably by the control tanks, but the grass tanks were significantly better at nitrogen removal. Total phosphorus concentrations were reduced only slightly by passage through the tanks. The fast flow rate tanks produced the greater grass yields, while the slow flow rate tanks were more effective in nutrient removal from the sewage effluent. From grass yield and analyses data, the amount of plant nutrient material removed by the grasses was small compared to the total quantity supplied. Further studies are suggested to determine economic factors and design parameters.

STUDIES RELATING TO MARKET PROJECTIONS FOR ADVANCED WASTE TREATMENT,
Federal Water Pollution Control Administration, Cincinnati, Ohio.
Louis Koenig.
Available from the NTIS as PB-187 862, $3.00 in paper copy, $0.95 in microfiche. FWQA, Cincinnati Water Research Laboratory, Robert A Taft Sanitary Engineering Center, Report WP-20-AWTR-17, December 1966. 72 p, 8 fig, 13 tab, 23 ref, 1 app. FWQA Project 17000--12/66, Contract PH-86-64-39.

Descriptors: *Waste water treatment, *Economics, Distillation, Adsorption, Electrodialysis, Water reuse.
Identifiers: *Ultimate disposal.

To assess the present status of waste water treatment, the type of treatment now in use and the amount of waste water discharged, were determined for the major streams in the country. About 4% of 100-mile river basins now have full secondary treatment. A study was made to determine the percentage of municipal waste water present in surface supplies of 155 cities of populations of 25,000 or more. The maximum was 18% and median was 3.5%. Consideration was given in this study to the possibility of logistical imbalances that might occur if advanced waste treatment was applied to nearly all waste waters. If a distillation-adsorption system was used, less than 6% of the nation's annual fuel consumption would be used and less than 0.5% of the total power generation would be required. Activated carbon needs, however, would double. If electrodialysis was applied, 4% of the national power would be required. Membrane production would have to increase several thousandfold. Ultimate disposal of concentrates by injection, incineration, pipelining, etc., would create no imbalances. (Selby-Texas)
W71-02279

FEASIBILITY OF GRANULAR, ACTIVATED-CARBON ADSORPTION FOR WASTE WATER RENOVATION,
Pittsburgh Chemical Co., Pa.
R. S. Joyce, and V. A. Sukenik.
Available from NTIS as PB-168 838, $3.00 in paper copy, $0.95 in microfiche. FWQA Robert A Taft Sanitary Engineering Center, Report AWTR-10, May 1964. 32 p, 1 app, 9 fig, 9 tab. FWQA Project 17020--05/64, Contract SAph-86-62-15.

Descriptors: *Waste water treatment, *Activated carbon, Adsorption, Cost, Alkylbenzene sulfonates, Detergents, Water reuse.
Identifiers: Packed beds, Reactivation.

This study was initiated to estimate the optimum bed depth and flow rates necessary for most economical use of the adsorptive properties of carbon and to examine the feasibility of regenerating the carbon. The results show that granular activated carbon in packed-bed column contractors remove much of the organic matter including alkybenzene-sulfonate from municipal waste water. The COD of a secondary effluent was reduced to about 12 to 20 ppm and the ABS was removed almost entirely. When an ABS breakthrough concentration of 0.5 ppm is used as a criterion of carbon exhaustion, the amount of carbon required for countercurrent contacting is less than one pound per 1,000 gallons. For the process to be economical the carbon must be reactivated and re-used. Thermal reactivation in a steam-air atmosphere was found to be technically feasible. With reactivation, the total cost of carbon adsorption was estimated to be less than 10 cents per 1,000 gallons for plants treating 10 mgd of waste water. (Selby-Texas)
W71-02280

ADVANCED WASTE TREATMENT RESEARCH PROGRAM.
Advanced Waste Treatment Research Program, Cincinnati, Ohio.
Available from NTIS as PB-168 837, $3.00 in paper copy, $0.95 in microfiche. FWQA Robert A. Taft Sanitary Engineering Center, Summary Report, AWTR-14, Jan 1962-June 1964, April 1965. 142 p, 24 ref, 56 fig, 9 tab. FWQA Project 17000-04/65.

Descriptors: *Waste treatment, *Adsorption, Foaming, Electrodialysis, Distillation, Freezing, Reverse Osmosis, Solvent extractions, Ultimate disposal, Waste water treatment.
Identifiers: Chemical oxidation.

Under an extensive contract research program, the Public Health Service's Advanced Waste Treatment Research Program, between January 1962, and June 1964, studied a wide range of physical-chemical separation processes to evaluate their effectiveness in purifying municipal and industrial waste waters. Laboratory investigations have shown that adsorption by granulated activated carbon is an effective method of removing organic contaminants but that other possible low-cost adsorbent materials studied failed to produce consistently effective organic removals. Studied were foaming of secondary effluent, single-pass electrodialysis, distillation, reverse osmosis, freezing, and solvent extraction with low-molecular-weight secondary and tertiary amines. In anticipating various approaches to the chemical oxidation of organic contaminants in waste water, the active-oxygen process appears to offer the best potential for technical and economic success. Ultimate disposal of concentrated wastes resulting from the application of physical-chemical separation processes to waste waters has been considered by methods such as (1) wet oxidation, (2) incineration, (3) injection to porous underground formations, (4) placement in natural or man-made underground cavities (Salt cavities, mined or nuclear blast cavities), and (5) disposal in the ocean after pipeline conveyance from point of origin. (Selby-Texas)
W71-02281

EVALUATION OF THE USE OF ACTIVATED CARBONS AND CHEMICAL REGENERANTS IN TREATMENT OF WASTE WATER,
Dow Industrial Service, Cleveland, Ohio.
R. L. Johnson, F. J. Lowes, Jr., R. M. Smith, and T. J. Powers.
Available from NTIS as PB-168 795, $3.00 in paper copy, $0.95 in microfiche. FWQA Robert A. Taft Sanitary Engineering Center Report AWTR-11, May 1964. 48 p, 24 fig, 9 tab, 38 ref. FWQA Project 17020-05/64, Contract SAph 76290.

Descriptors: *Waste water treatment, *Activated carbon, Adsorption, Economics, Chemical oxygen demand.
Identifiers: *Hydrogen Peroxide, Regeneration.

By using a continuous-flow, column-type test, the capacities of six activated carbons for the soluble organics in filtered secondary effluent were obtained. Results varied from 7 to 13 grams COD per 100 grams of carbon. Because of the manner in which the test was carried out, only the carbon with the smallest capacity was loaded to the maximum extent possible. The chemical regeneration of exhausted carbon was investigated by use of nine inorganic oxidizing agents: chlorine, bromine, potassium permanganate, sodium dichromate, sodium persulfate, potassium persulfate, sodium peroxide, hydrogen peroxide, and ozone. Only hydrogen peroxide was capable of restoring measureable adsorption capacity after more than two cycles of exhaustion and regeneration. The economic feasibility of chemical regeneration is not promising. (Selby-Texas)

METROPOLITAN PLANNING GUIDELINES, SEWAGE TREATMENT (FACILITIES).
Northeastern Illinois Planning Commission, Chicago, Illinois.

Northeastern Illinois Planning Commission Report, April 1965. 33 p, 9 fig, 9 tab, 14 ref. HUD Grant.

Descriptors: *Sewage treatment, *Waste water treatment, *Urbanization, *Cities, *Municipal wastes, Septic tanks, Illinois, Surveys, Waste water disposal, Sewage, Planning.
Identifiers: *Metropolitan planning, *Chicago.

The findings are summarized of a project designed to: (1) inventory public sewage treatment facilities in the six-county Chicago metropolitan area; and (2) to determine how much new development has taken place inside and outside the areas served by these systems. The data were derived from field surveys, interviews, and unpublished materials. The information is intended for use in the preparation of a comprehensive metropolitan plan. In 1964, approximately 90 percent of the metropolitan area population was served by public sewers, while 10 percent relied on septic tanks and other private equipment. Seven hundred square miles were served by 128 sewer systems and over 3,000 square miles by septic tanks and other facilities. Sewered areas have a gross population density of 8,000 persons per square mile compared with 1,300 for non-sewered areas. Sewage treatment systems are small, serving about one square mile on the average. Three problem areas requiring further study and definition were identified. They are: (1) pollution of surface and ground waters, (2) cost of sewage treatment, and (3) improper size and location of treatment plants for expansion to meet future needs. Figures, charts and tables are included to document the type, capacity, efficiency, age, location and area served by public treatment facilities in Cook, DuPage, Will, Lake, Kane and McHenry counties. (Poertner)

CITY OF SAN DIEGO WATER RECLAMATION STUDY FOR BALBOA PARK AND MISSION BAY PARK.
Boyle Engineering, San Diego, California.

Report to City of San Diego, California, March 1963. 250 p, 40 fig, 50 tab, 52 ref.

Descriptors: *Water reuse, *Irrigation programs, *Groundwater recharge, *Return flow, *Irrigation water, Parks, California, Reclaimed water, Water spreading, Artificial recharge, Saline water intrusion, Irrigation engineering, Irrigation systems, Water supply.
Identifiers: *San Diego.

Benefits are indicated that would result from the conservative re-use of a portion of San Diego's sewage, currently wasted to the ocean; and presents alternative plans for the implementation of a project that would supply the irrigation water requirements of Balboa Park and Mission Bay Park. Each of several alternative plans is economically feasible and it is in the best interests of the City to actively enter the field of water reclamation. It is recommended that: (1) the City pursue a plan of action leading to the design, construction and operation of a water reclamation system with adequate capacity to serve the irrigation requirements of both Balboa Park and Mission Bay Park; (2) areas owned by the City in the vicinity of the designated water reclamation plant sites should be tentatively set aside for water reclamation purposes; and (3) the City should reevaluate the potential value of ground water recharge using reclaimed water in Mission Valley, with the possibility of reactivating the City's Mission Valley well field as a supplemental potable water supply. San Diego presently imports up to 96 percent of its annual water requirements from the Colorado River. The California Water Plan includes provisions for furnishing water to San Diego from Northern California; however, the cost will be from three to five times the present cost of imported water. (Poertner)

MECHANICAL - DRAFT COOLING TOWERS,
Carter Thermal Engineering Ltd.
G. B. Hill.
Chemical and Process Engineering - Heat Transfer Survey, p 33-40, 1969.

Descriptors: *Cooling, *Thermal pollution, Thermal powerplants, *Cooling towers, Cooling water, Heating, Heat budget, Atmosphere, Humidity, Heat transfer, Recirculated water.
Identifiers: Mechanical - Draft cooling.

The use and advantages of mechanical-draught cooling towers is discussed as to theory, construction, operation and suitability. For theoretical evaluations the simplifying approximation of Merkel's total heat theory is used. As to construction, the main emphasis is put on packing where most of the cooling of the water takes place. Splash packing and film packing (in grid or plate arrangements) are the most commonly used. Mechanical-draught cooling towers have a relatively simple construction, although the heat transfer processes which take place within them are extremely complex. Except for ambient air wet bulb temperature, they are virtually independent of atmospheric conditions. They can cool water to temperatures below ambient with low capitol and operational costs in a comparatively small space. To quote for a tower, manufacurers require information on cooling duty, restrictions are on height or weight and noise limitations. (Novotny-Vanderbilt)

HYDROLOGY OF SPRAY-RUNOFF WASTE WATER TREATMENT,
Robert S. Kerr Water Research Center, Ada, Okla.
Richard E. Thomas, James P. Law, Jr., and Curtis C. Harlin, Jr.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR3, Paper 7538, p 289-298, September 1970. 10 p, 4 fig, 4 tab, 15 ref.

Descriptors: *Waste water disposal, *Soil disposal fields, *Overland flow, *Runoff, *Sprinkler irrigation, Evaporation, Evapotranspiration, Water balance, Hydrologic budget, Sewage treatment, Soil water movement, Waste treatment.
Identifiers: Spray-runoff waste water treatment.

Liquid measuring procedures used in a 12-month study of the hydrology of the soil treatment system at Campbell Soup Company's Paris, Texas plant accounted for 93% of the total liquid applied to the soil. The rainfall and waste water applied to the soil system are accounted for as follows: 18% is lost to the atmosphere through evaporative processes; 61% is recovered as runoff; and 21% percolates through the soil. The fraction of the treated waste water recovered as runoff ranges from a low of 30% to a high of 85%. This range in the percent runoff is influenced by climate, soil textural class, and waste water spray schedules. Waste water spray schedules are controlled to partially offset variations in the percent runoff which would normally occur as the result of climatic influences. (Knapp-USGS)

MECHANICS OF CONDENSER WATER DISCHARGE FROM THERMAL POWERPLANTS,
Massachusetts Inst. of Tech., Cambridge, Mass. Dept. of Hydraulic Engineering.
Donald R. F. Harleman.
In: Engineering Aspects of Thermal Pollution, Chapter 5, p 144-164, 1969. 13 fig, 9 ref.

Descriptors: *Thermal powerplants, *Thermal pollution, *Stratification, Mixing.
Identifiers: *Densimetric Froude number.

This paper discusses some of the techniques in the planning and design stage which should be used in considering whether all or a portion of the total waste heat from thermal or nuclear power plants is to be disposed of into an adjacent waterway. Also discussed is the degree of flexibility in controlling conditions in the waterway which is available to the engineer. The interrelationship between the design of the outlet and intake structures for stratification of the condenser water in the adjacent water-way is analyzed, and it is shown that the primary requirement for stratification is an outlet channel designed to have a densimetric Froude number less than unity. The mixing of the heated condenser water by means of a diffuser pipe extending across the river bottom transverse to the direction of the flow is also analyzed. The model experiments of a section of the diffuser pipe of Brown's Ferry's Nuclear powerplant are explained. Some conclusions were: (a) Analytical techniques based on the mechanics of thermally stratified flow can be used in the design of condenser water intake and discharge structures. (b) The designer has a high degree of flexibility in controlling the environmental changes in a waterway receiving thermal discharges from a powerplant. (c) Thermal conditions ranging from stratification of the effluent to complete mixing can be achieved through proper design. (See also W71-02478) (Guerrero-Vanderbilt)

DESIGN AND OPERATION OF COOLING TOWERS,
Public Service Co. of Colorado, Denver.
Charles Waselkow.
In: Engineering Aspects of Thermal Pollution, Chapter 9, p 249-271, 1969.

Descriptors: *Temperature, *Cooling towers, *Cooling water, Thermal pollution, Design criteria, Operation and maintenance.
Identifiers: GEA Air Exchangers-Bochum-West Germany, Wet-bulb temperature, Drift loss, Tower fill, Road-hazard.

One of the truly critical design criteria necessary to a good cooling-tower design is the determination of the design inlet wet-bulb temperature. This temperature should be for the weather conditions encountered during the four summer months of the year. The average steam plant rejects about 5500 to 6000 BTU per Kwhr. Drift loss (0.2%) must be considered in cooling tower design. The sewage effluent used for cooling contains detergents and some organic matter which proved troublesome when the drift spray was carried to the nearby substation by the prevailing winds. One of the remedial measures taken was the installation of additional mist eliminators in the plenum of the cooling tower. The wood deterioration on the Public Service company of Colorado towers is unexplainable. The deterioration of the redwood which is used as towerfill at any one of the three stations bears no resemblance to that at either of the others. One important item of public relations, as it concerns cooling tower operations, is the problem of road hazard. The cooling tower vapor can become a problem on the adjacent streets and highways, if the atmospheric conditions are right and the construction of the tower is not proper. The GEA Air-cooled system is suitable for unusually water scarce areas. It conducts the exhaust steam from the turbine, through large ducting, directly to a header. This minimizes power consumption and prevents freezing problems during cold weather or light load operation. (See also W71-02478) (Upadhyaya-Vanderbilt)

SUMMARY AND STATUS OF THE ART,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
Frank L. Parker, and Peter A. Krenkel.

In: Engineering Aspects of Thermal Pollution, Chapter 11, p 313-328, 1969.

Descriptors: *Thermal pollution, *Cooling water, Stratified flow, Temperature, Ecology, Fishkill.
Identifiers: Electric generating capacity, Magnetohydrodynamic power generation (MHD), Cooling devices.

Analysis of steam-electric cooling discharges for 1965 indicates an average 13F rise in water temperatures after passing through the condensers. The amount of water withdrawn for this purpose is approximately 42 trillion gallons per year, which is roughly 10% of total flow of water in the U. S. The electric generating industry is doubling in magnitude every 10 years. We can expect that the thermal problems associated with cooling water discharges from steam-electric generating plants will even further exceed the problems from industrial sources, because it appears that industrial plants have, by and large, already reached the maximum economically efficient size. The best efficiencies for present day fossil-fueled plants are about 40% and for light-water reactors about 34%. The MHD systems with single cycles can achieve thermal efficiencies of 50 55%, which possibly could be boosted to 60 to 70% by using a binary cycle. If a binary cycle using a gas turbine is utilized, the thermal pollution problem is avoided entirely. Another possibility for central station generation of electricity is by controlled thermonuclear fusion. Of all the effects of the increased heat to our streams, possibly the most striking is the induction of stratified flow by the discharge of these warmed waters to surface streams, reducing the waste-assimilative capacity of the stream, changing the algal population, and causing chemical reactions to proceed at a faster rate. REGIONAL WATER AND SEWERAGE FACILITIES PLAN 1990.
Indian Nations Council of Governments, Tulsa, Okla.

Available from NTIS as PB-194 141, $3.00 in paper copy, $0.95 in microfiche. Report to Indian Nations Council of Governments, April 1970. 186 p. HUD Oklahoma P-117.
Identifiers: *Regional planning, *Oklahoma, *Water supply, Urban areas, *Sewage, Environmental engineering, Demography, Land use, Management methods, Financing, Creek County (Okla), Osage County (Okla), Rogers County (Okla), Tulsa County (Okla), Indian Nations Council of Governments, Capital improvements.

The purposes of the study are: To prepare a regional plan which will aid in the development and maintenance of water supply and waste disposal facilities and thereby assist in the provision of healthful living conditions; to assist to orderly land use change, relationships, and development; and to qualify the region for financial assistance for the construction of water and sewage facilities. The water and sewage plan is based upon guidelines concurrently being developed by the Indian Nations Council of Governments (INCOG).

THE INFLUENCE OF AERATION ON THE COMPOSTING OF POULTRY MANURE-GROUND CORNCOB MIXTURES,
Guelph Univ. (Ontario). Dept. of Microbiology.
R. G. Bell.
Journal of Agricultural Engineering Research, Vol 15, No 1, p 11-16, 1970. 5 fig, 2 tab, 8 ref.

Descriptors: *Farm wastes, *Aeration, *Poultry, Laboratory tests, Odor, Salmonella sp., Temperature, Depth, Microorganisms, Waste water treatment.
Identifiers: *Composting, Corncob mixtures, Canada, Microbial activity.

The influence of the rate of aeration on 1.5m colums of composting mixtures of 2 parts poultry manure and 1 part ground corncob was investigated. The results indicate that the optimum aeration rate for the production of a stable sanitary compost was 4 liters of air/m2/min for every 10 cm. of composting material up to a maximum depth of about 2.4 m. A detailed discussion of the materials, methods and results is presented. (Christenbury-Iowa State)

ENGINEERING ANALYSIS OF CATTLE FEEDLOTS TO REDUCE WATER POLLUTION,
Texas Technological Coll., Lubbock. Dept. of Civil Engineering.
W. Grub, R. C. Albin, D. M. Wells, and R. Z. Wheaton.
Transactions of the American Society of Agricultural Engineers, Vol 12, 1969, p 490-492, 495. 2 tab, 5 fig, 3 ref.

Descriptors: *Farm wastes, *Cattle, *Water pollution sources, Runoff, Precipitation, Nitrogen, Phosphorus, Biochemical oxygen demand, Slopes, Surfaces, Feeds, Silage, Management, Design, Waste water treatment.
Identifiers: *Feedlots, *Ration composition, Feedlot layout, Waste accumulation.

Incorporating both engineering and biological aspects, this report contains an analysis of data and suggests management and design practices that could reduce materially the pollution contributed by the confined land area where feeder cattle are maintained. The study was conducted in two phases. The first phase was concerned with the waste accumulation on the feedlot surface as influenced by ration. The second phase of the project was concerned with determining the quality of liquid runoff as related to the rations fed to cattle, as related to the time of accumulation of the manure pack. For the first phase, ration composition, its effect on quantity of excretion, and changes in the accumulated wastes are looked at. For the second phase, the effects of precipitation, surfacing material, land slope, depth of waste accumulation, feedlot layout, and ration composition are evaluated. Nitrogen, phosphorus and BOD were used as measures of pollution. (White-Iowa State)

TREATMENT AND DISPOSAL OF ANIMAL WASTES,
Cornell Univ., Ithaca, N.Y.
Raymond C. Loehr.
Industrial Water Engineering. Vol 7, No 11, p 14-18, November 1970. 3 fig.

Descriptors: *Farm wastes, Lagoons, Drying, Nutrients, Disposal, Inorganic compounds, Nitrogen, Phosphorus, Nitrification, Denitrification, Confinement pens, Waste water treatment.
Identifiers: Holding tanks, In-house ditches, Oxidation ditches, Separation of wastes, Composting, System.

Due to confinement feeding of livestock it has become doubtful from the profit standpoint to recycle manure by applying it to land. There has been an increase of 120% in the number of cattle of feed in the last 15 years. Laws are being considered which make it mandatory to reduce the pollution potential of livestock waste. The nine most feasible systems for animal waste disposal are discussed. These systems utilize either holding tanks, in-house ditches, separation of wastes, or drying and composting. These systems will remove most of the organic-oxygen-demanding material but not the inorganic nutrients. Land disposal has been effective for disposal of phosphorous. However land disposal for nitrogen may not be adequate. Two techniques for reducing the nitrogen load in animal waste is through ammonia release and the nitrification-denitrification cycle. USE OF SOIL TO TREAT ANAEROBIC LAGOON EFFLUENT RENOVATION AS A FUNCTION OF DEPTH AND APPLICATION RATE,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
J. K. Koelliker, and J. R. Miner.
Transactions of the American Society of Agricultural Engineers, Vol 13, No 4, p 496-499, July-August 1970. 3 fig, 4 tab, 19 ref.

Descriptors: *Denitrification, *Nitrogen, *Irrigation, Farm wastes, Chemical oxygen demand, Lagoons, Nitrates, Nitrites, Ammonia, Bacteria, Treatment, Disposal, Anaerobic conditions, Waste water treatment.
Identifiers: *Nitrogen balance, Nitrobacter, Nitrosomonas, Lagoon effluent, Application rates.

This paper reports the findings from a study where lagoon effluent was applied to soil for final treatment. The active soil profile appears to offer great potential as a final treatment media for partly treated animal wastes. Anaerobic livestock-lagoon effluent sprinkled on grass-covered soil profile reduced the COD, phosphorous, and nitrogen concentrations 95, 99, and 80 percent, respectively in 3 months. Loading range was 13.9 to 30.5 in. of lagoon effluent. Removal of COD was attributed to biological activity and physical filtration in the upper inches of soil. Phosphorus reduction resulted from chemical activity of the clay fraction near the soil surface. Nitrogen reduction was attributed primarily to dentrification in the soil profile. It was recommended that if nitrogen reduction is a goal in waste water disposal, a rather wet schedule should be followed. The applied waste water should contain some organic load so that a substrate will be provided for the denitrifying bacteria. (Christenbury-Iowa State)

BIO-OXIDATION OF SWINE WASTE BY THE ACTIVATED-SLUDGE PROCESS,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
Ronald E. Hermanson, Thamon E. Hazen, and Howard P. Johnson.
Transactions of the American Society of Agricultural Engineers, Vol 12, No 3, 1969, p 342-348. 5 fig, 1 tab, 19 ref.

Descriptors: *Farm wastes, *Hogs, *Activated sludge, *Model studies, Anaerobic conditions, Farm lagoon, Regression analysis, Least squares method, Biochemical oxygen demand, Aeration, Settling basins, Nitrogen, Temperature, Effluent, Dissolved oxygen, Hydrogen ion concentration, Waste water treatment.
Identifiers: *Extended aeration, BOD-reduction efficiency, Mixed liquor, Aeration tank, Suspended solids.

The purpose of this research was to investigate the extended-aeration, activated-sludge process on swine waste treatment. Two objectives were: (1) to develop a mathematical model for the BOD-reduction efficiency of the process, and (2) to verify the model and evaluate its coefficients by conducting experiments with a laboratory-scale plant. The components of the activated-sludge treatment plant were as follows: (1) an aeration tank; (2) an

aeration system; (3) a sedimentation tank; and (4) a mechanism for returning settled activated sludge to the aeration tank. The experimental model was comprised of an aeration tank and a sedimentation tank made of Plexiglas, with two galvanized sheet metal sedimentation tanks as alternates. Three capacities were required in the sedimentation section to provide suitable detention times over the range of flow rates used. The following conclusions resulted from this research. (1) Effluent from an anaerobic lagoon is sufficiently constant to be a practical influent substrate for model studies. (2) Excessive solids loss because of denitrification can be avoided by proper design of the sedimentation tank, provided the flow rate does not vary widely. (3) The mathematical model satisfactorily predicted the BOD-reduction efficiency of an extended-aeration, activated-sludge plant, as evidenced by the reasonably high multiple r2 (0.92) and the low standard error (2.6 percent) of the experimental regression equation. (4) The aeration tank of an extended-aeration activated-sludge plant for the treatment of the effluent from an anaerobic swine lagoon designed according to the equation developed. (White-Iowa State)

UNDER-CAGE MANURE DRYING SYSTEM SOLVES ODOR PROBLEMS,
Cloisterdale Farms, Ephrata, Pa.
Glenn H. Herr.
Farm Service Bulletin, July-August, 1970. Poultry Digest, Vol 29, No 344, p 476-479, October 1970. 4 fig.

Descriptors: *Farm wastes, *Poultry, *Odors, *Aeration, *Disposal, Economics, Aerobic conditions, Forced drying, Liquid wastes, Drying, Lagoons, Anaerobic bacteria, Costs, Waste water treatment.
Identifiers: *Stirring, Odor-causing bacteria, Semi-dry manure.

This paper deals with the problems and their solutions encountered by a commercial poultry farm with odors and waste management. The various systems that were tried unsuccessfully are discussed. Their solution was one developed by Dr. Glenn Bressler and co-workers at Pennsylvania State University for drying the manure. The system employs a stirring device and forced air to keep the manure aerobic. The manure is dried to one-third its original weight which has eliminated many of their disposal problems. The cost of the system is discussed. (Christenbury-Iowa State)

POULTRY MANURE LAGOON DESIGN,
California Univ., Davis. Agricultural Extension Service.
Robert A. Parsons, Fred Price, and W. C. Fairbank.
Poultry Digest, Vol 29, No 344, p 485-488, October 1970. 6 fig.

Descriptors: *Farm wastes, *Poultry, *Lagoons, *Design criteria, *Odor, Cleaning, Recirculated water, Costs, Anaerobic conditions, Anaerobic bacteris, Aerobic conditions, Aerobic bacteria, Aeration, Waste water treatment.
Identifiers: *Flushing gutter, Macerated chicken carcasses, Floating debris, V-trough, Washout system, Overload, Malfunctions, Gutter design, Thiopedea roses.

This paper deals with lagoon design criteria for poultry manure. A lagoon is a satisfactory means of poultry manure disposal. The lagoon should be used only in rural areas that are tolerant of varied but dilute odors of farm production. Overloading is about the only cause of lagoon malfunction. Size requirements, construction, flushing system, and lagoon operation are discussed. (Christenbury-Iowa State)

ANIMAL WASTE MANAGEMENT.
Cornell Univ., Ithaca, N.Y.

R. C. Loehr, Editor. In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, January 13-15, 1969. 414 p.

Descriptors: *Farm wastes, *Hogs, *Cattle, *Water pollution, *Air pollution, Soil contamination, Rates of application, Poultry, Sheep, Biochemical oxygen demand, Chemical oxygen demand, Dissolved oxygen, Hydrogen ion concentration, Oxidation Lagoons, Lagoons, Aeration, Soils, Moisture content, Fertilizers, Nitrogen, Phosphorus, Potash, Economics, Legal aspects, Legislation, Water quality act, Water table, Odors, Rotors, Aerobic conditions, Anaerobic conditions, Digestion, Antibiotics, Irrigation, Oxygen, Rotations, Hydrology, *Waste water treatment.
Identifiers: *Oxidation ditch, Land disposal, *Feedlots, *Confinement, Population equivalent, Slatted floors, Decomposition.

The increase in high density confined animal production operations in the past decade has led to a number of environmental quality problems, such as air and water pollution. The 1969 Conference attempted to bring knowledgeable individuals from many disciplines together to mutually discuss various aspects and potential solutions to the animal waste management problem. Forty-six papers, reports, and speeches are presented in the proceedings. Such diverse topics as hydrology, economics, odor measurement, lagooning, aerobic digestion, and land disposal are presented. Research and studies in many fields are reported. (White-Iowa State)

THEORY AND FUTURE OUTLOOK OF ANIMAL WASTE TREATMENT IN CANADA AND THE UNITED STATES,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
P. H. Jones.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 23-36. 2 tab, 27 ref.

Descriptors: *Farm wastes, *Biochemical oxygen demand, *Biological treatment, *Oxygen, Water pollution, Nitrogen, Odors, Carbon, Waste water treatment, Aeration, Aerobic treatment, Anaerobic digestion.
Identifiers: Pollution potential, Waste characteristics, Integrated farming, Aerobic composting.

This paper presents some of today's theories on waste treatment and their effectiveness, both socially and physically. The paper tells of the pollution potential and characteristics of animal waste, as well as some of the waste treatment objectives. Theoretical formulas are presented for the introduction of oxygen into an aqueous system, and the reduction of BOD. Potential solutions to the waste treatment problem are listed and summarized as follows: integrated farming, anaerobic holding, aerobic systems, complete treatment, anaerobic digestion, drying and incineration, and aerobic composting. Research needs are given, as well as a look to the future for what may be possible. (White-Iowa State)

DESIGN PARAMETERS FOR THE STABILIZATION OF HIGHLY ORGANIC MANURE SLURRIES BY AERATION,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Sciences.
Albert F. Vickers, and Emil J. Genetelli.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 37-49. 7 fig, 6 tab, 11 ref.

Descriptors: *Farm wastes, *Poultry, *Aerobic treatment, *Biochemical oxygen demand, Dissolved oxygen odor, Waste water treatment.
Identifiers: Aerobic stabilization, Manure slurry, Ultimate disposal, Loading parameter, Suspended solids.

It has been determined in this research that aerobic stabilization basins are not suitable for the complete treatment of slurries of poultry manure. However, the aerobic stabilization basins do provide satisfactory pretreatment prior to ultimate disposal. This treatment provides sufficient stabilization of the manure to eliminate nuisance problems when ultimately disposed of on land. The critical loading parameter determined in this bench scale system is a volume loading of 60 cubic feet of aeration basin per pound of applied BOD in the manure slurry. The average BOD reduction in the unsettled effluent was 87% with an average solids destruction of 53%. Foaming difficulties were encountered after the critical loading parameter determined was exceeded. (White-Iowa State)

SWINE WASTES, CHARACTERIZATION AND ANAEROBIC DIGESTION,
Kansas Agricultural Experiment Station, Manhattan.
Lawrence A. Schmid, and Ralph I. Lipper.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 50-57. 4 tab, 2 fig, 3 ref.

Descriptors: *Farm wastes, *Anaerobic digestion, Swine, Biochemical oxygen demand, Chemical oxygen demand, Methane, Odor, Waste water treatment.
Identifiers: *Digester, Waste digestion, Feed ration.

Laboratory and field tests were undertaken to show the effectiveness of anaerobic digestion as a possible solution to swine waste treatment. The following conclusions are made from the study: (1) The waste characteristics can be related to pounds of waste per unit pound of live weight. (2) If organic removal is the desired objective, it can best be done by solids removal from the fresh wastes resulting in COD reductions of 90%. (3) Mixing is required in the anaerobic digestion phase to disperse the fresh waste. (4) Normally, the efficiency of anaerobic treatment can be increased by increasing the solids retention time. (5) Results have shown that conventional anaerobic digestion cannot be practiced on raw undiluted hog wastes which include the urine. (6) Digestion only for liquifaction does not require the close environmental control required to stimulate growth of methane bacteria. (7) Design for the objective of waste liquifaction for the purpose of reuse as flushing water, ultimate disposal on land, and ease of handling can be one answer to the problem of handling and treatment of wastes from confinement feeding of swine. (White-Iowa State)
W71-02708

AEROBIC DECOMPOSITION OF SOLID WASTES FROM CATTLE FEEDLOTS,
Texas Technological Coll., Lubbock. Dept. of Civil Engineering.
D. M. Wells, R. C. Albin, W. Grub, and R. Z. Wheaton.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 58-62. 4 fig.

Descriptors: *Farm wastes, *Moisture content, Cattle, Temperature, Nitrogen, Phosphorus, Waste water treatment.
Identifiers: *Aerobic stabilization, *Composting process.

This is a progress report on research being conducted on the aerobic stabilization of solid beef feedlot wastes and is concerned with the composting process and with the effect of feed, management, and climate on waste stabilization. Two general areas were reported in the paper, one concerned with composting in open air piles and the other with composting in a specially built drum type digester. Forty per cent reductions in volume and 20% losses in dry matter were noted. The most rapid rate of stabilization seemingly takes place during the first few days of the process, with a steady decrease in the rate of stabilization occurring with time. (White-Iowa State)

ANALYSIS FOR OXYGEN TRANSFER COEFFICIENTS IN ROTOR AERATION SYSTEMS,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
John J. Kolega, Gordon L. Nelson, and Quintin B. Graves.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 63-75. 9 fig, 4 tab, 13 ref.

Descriptors: *Farm wastes, *Equations, Oxygen, Dissolved oxygen, Oxygenation, *Model studies, Waste water treatment.
Identifiers: *Rotor aerator, *Oxidation ditch, Oxygen transfer.

The laboratory method described presents a technique for use in the engineering design and analysis of a horizontal rotor aerator system in livestock waste management. This procedure can be used to obtain quantitative prediction equations to estimate the oxygen transfer coefficients for a selected range of operating conditions. Once the prediction equation for a given system is developed, it can be further used to evaluate new applications provided the parameters fall within the range of the predicted equation developed. An equation for estimating the oxygen transfer coefficients per revolution of rotor was obtained with a model rotor aerator using distilled water as the liquid. Rotor aerator performance curves illustrating how the prediction equation can be used in livestock waste system design and management were also developed. (White-Iowa State)

AEROBIC STORAGE OF DAIRY CATTLE MANURE,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
Don E. Bloodgood, and C. M. Robson.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 76-80. 2 tab, 1 fig, 4 ref.

Descriptors: *Farm wastes, Cattle, Aeration, Temperature, Odor, Chemical oxygen demand, Waste water treatment.
Identifiers: Dairy cattle, Loading rates, Kjeldahl nitrogen, Degradation, Volatile solids.

Laboratory tests with seven liter, aerated containers were performed in 4C and 24C rooms. Loading rate of 60, 80, 100, and 120 grams of wet raw dairy manure per day were used at both temperatures. Conclusions were made from the results of the experiment as follows. (1) The amount of leading does not influence the degree of degradation that takes place. (2) The tests indicate a decrease in volatile solids of 20 per cent at 4C and 42 per cent at 24C. (3) Appreciable amounts of material with a COD are removed in the aerobic storage process. (4) The Kjeldahl nitrogen concentration of material remaining after aerobic storage is higher after the storage period. (5) Foaming is a real problem in the aerobic storage of manure from dairy cattle. (6) Aerobic storage of manure from dairy cattle has promise of minimizing the odor problem encountered in the spreading of unaerated material after storage. (White-Iowa State)
W71-02711

AEROBIC DIGESTION OF DILUTED ANIMAL MANURE IN CLOSED SYSTEMS - TEMPORARY EXPEDIENT OR LONG RANGE SOLUTION,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
J. T. Clayton, and T. H. Feng.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 81-87. 6 fig, 1 ref.

Descriptors: *Farm wastes, *Aerobic treatment, *Anaerobic digestion, *Effluents, Cattle, Biochemical oxygen demand, Nitrates, Hydrogen ion concentration, Waste water treatment.
Identifiers: *Sedimentation tanks, *Degradation, Volatile solids.

The pilot scale manure treatment system studied was an adapted composite of two aerobic-anaerobic dairy manure treatment systems. It was designed to process the waste of one mature dairy cow, together with the water necessary to flush the manure from the barn. The system consisted of a 2000 gallon primary sedimentation tank, a 1000 gallon aeration tank, and a 200 gallon final sedimentation tank. The effluent was collected and analyzed at three different points in the closed system. Graphs of total solids, volatile solids, pH, BOD, and nitrate content versus time are given for the three effluent collection points. The overall objective was to design a system the effluent from which could be used as a flushing and transport medium for subsequent cleanings of a dairy cow housing facility, or be discharged into a water course. INFLUENCE OF CHEMICAL TREATMENTS UPON DIGESTIBILITY OF RUMINANT FECES,
Agricultural Research Service, Beltsville, Md. Animal Husbandry Research Div.
L. W. Smith, H. K. Goering, and C. H. Gordon.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 88-97. 10 tab, 11 ref.

Descriptors: *Farm wastes, *Cattle, *Digestion, Sheep, Orchardgrass, Alfalfa, Ruminants, Waste water treatment.
Identifiers: Sodium hydroxide, Sodium peroxide, In vitro fermentation, Chemical treatment.

Sodium hydroxide and sodium peroxide treatment of orchardgrass and alfalfa cow feces resulted in large decreases in the cell wall (CW), cellulose, hemicellulose, and lignin contents. Treatment with sodium chlorite changed composition little except for a large reduction in lignin content. True CW digestibility was increased several fold by each treatment as measured by an in vitro fermentation technique. Corn silage rations containing 25% of the total dry matter (DM) as either untreated or 3% sodium peroxide treated orchardgrass feces were consumed equally well as an all corn silage ration by sheep. Lower intake was observed for a corn silage ration which contained 50% similarly treated feces also on a dry matter basis. Digestibility coefficients for the various components of the feces portion of the rations were calculated by difference. Addition of 3% sodium peroxide to feces increased average DM, 29; nitrogen, 25; CW, 55; cellulose, 41; and hemicellulose, 90 digestibility units over that of the untreated feces. Neither concentration nor molar ratios of ruminal volatile fatty acids changed due to the inclusion of treated or untreated feces in rations for sheep. (White-Iowa State)

THE VALUE OF HYDROLYZED AND DRIED POULTRY WASTE AS A FEED FOR RUMINANT ANIMALS,
Pennsylvania State Univ., University Park.
T. A. Long, J. W. Bratzler, and D. E. H. Frear.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 98-104. 12 tab.

Descriptors: *Farm wastes, *Feeds, *Nitrogen, Poultry, Cattle, Sheep, Waste water treatment.
Identifiers: *Hydrolyzed poultry waste, Rations, Feedlot performance, Digestion coefficient, Carcass characteristics.

Information was presented concerning the value of heat treated poultry waste as a source of nutrient for ruminant animals. In a metabolism trial, whethers were fed a semi-purified ration in which the nitrogen was supplied by hydrolized poultry waste, cooked poultry waste, or soybean oil meal. The digestion coefficients for crude protein differed significantly (PA.05) between all rations. Nitrogen excreted in the feces was significantly lower for the soybean oil meal ration than for the poultry waste ration. No other significant differences were observed. It was found in a fattening trial with steers that rate of gain, feed efficiency, and carcass grade were not significantly different for beef steers fed rations in which the supplemental nitrogen was supplied as soy bean oil meal, hydrolized poultry waste or dried poultry waste. Rate of gain was higher (PA.05) for the steers fed the ration containing urea. The treated poultry waste rations were readily consumed by the steers and no undesirable effect on carcass characteristics were found. (White-Iowa State)

CATTLE MANURE: RE-USE THROUGH WASTELAGE FEEDING,
Alabama Agricultural Experiment Station, Auburn.
W. Brady Anthony.
In: Animal waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 105-113. 9 tab, 1 fig, 10 ref.

Descriptors: *Farm wastes, *Cattle, Feeds, Performances, Waste water treatment.
Identifiers: *Wastelage, Yeast fermentation.

Manure collected daily from a concrete floor of a pen housing steers was blended with a fattening feed in the ratio of 2:3. The wastelage system was developed for more flexibility. Wastelage is the combining of fresh manure with ground grass hay in the ratio of 57:43 with storage in a silo until fed. Five conclusions were drawn from the study. (a) Fresh feedlot manure can be mixed with concentrate and fed successfully to cattle with a considerable saving in feed used per unit of beef produced. (b) Wastelage represents a flexible system of removing manure daily, blending it with hay, and storing as silage. (c) Elimination of pollution from steer feedlots can be obtained through use of the wastelage plan. (d) Yeast can be produced on fluidized and aerated manure. About 68% of manure dry matter appears recoverable in the yeast fermentation product. (e) Feedlot manure properly handled is a valuable product for conversion to an animal feed. (White-Iowa State)

USE OF POULTRY MANURE FOR CORRECTION OF Zn and Fe DEFICIENCIES IN PLANTS,
Colorado State Univ., Fort Collins. Dept. of Agronomy.

B. F. Miller, W. L. Lindsay, and A. A. Parso.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 120-123. 2 tab, 6 ref.

Descriptors: *Farm wastes, *Fertilizers, Poultry, Iron, *Corn, Waste water treatment.
Identifiers: *Micronutrient deficiency, Zinc.

A greenhouse study was conducted with corn on a soil deficient in available Zn and Fe. Fifteen fertilizer combinations including N,P, Zn, Fe, poultry manure and poultry manure ash were used. Adequate K was supplied by the soil. The results of this study are interpreted as showing that poultry manure is beneficial for the correction of Zn and Fe deficiencies. This benefit is supplementary to its value as an NPK fertilizer. Furthermore, the organic fraction of poultry manure is important in rendering Zn and Fe more available to plants. This beneficial effect is greater in the case of Fe than Zn, but it is significant in both cases. The findings of this study support the hypothesis that manure and other organic wastes may either supply or give rise to natural chelating agents that aid in the solubilization of insoluble micronutrient elements in soil and thereby render them more available to plants. STATUS REPORT ON WATER POLLUTION CONTROL FACILITIES FOR FARM ANIMAL WASTES IN THE PROVINCE OF ONTARIO,
A. R. Townshend, K. A. Reichert, and J. H. Nodwell.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 131-149. 14 tab, 5 fig, 9 ref.

Descriptors: *Farm wastes, *Water pollution control, Cattle, Hogs, Poultry, Lagoons, Waste water treatment.
Identifiers: *Population equivalent, *Confinement housing, Pollution potential, Concentrations, Land disposal, Oxidation ditch.

Farm animal waste problems of the agricultural industry in Ontario are concentrated on the liquid manure water pollution control facilities presently serving swine, beef cattle, dairy cattle, and poultry confinement housing operations. It is concluded that based on present technology and economics, the approach to animal waste disposal in Ontario for the forseeable future should continue to be one of storage and land disposal rather than treatment and effluent discharge to water courses. The status report estimates the pollution potential of farm animal wastes; outlines the present methods of handling liquid manure from confinement operations; tabulates animal waste characteristics, loadings, and population equivalents; gives field data and experiences on typical water pollution control facilities; and concludes with guidelines on the selection, design, and operation of farm waste systems. DISPOSAL OF DAIRY CATTLE WASTES BY AERATED LAGOONS AND IRRIGATION,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
A. C. Dale, J. R. Ogilvie, A. C. Chang, and M. P. Douglas.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 150-159. 11 fig.

Descriptors: *Farm wastes, *Oxidation lagoon, *Sprinkler irrigation, Biochemical oxygen demand, Chemical oxidation demand, Oxidation-reduction potential, Odor, Irrigation, Waste water treatment.
Identifiers: Dairy cattle.

The system studied the aerobic type using a lagoon for storage and treatment but relying solely on sunlight and algae for oxygen. A mechanical surface aerator was used to supply oxygen and for mixing. An overhead sprinkler irrigation system was used in conjunction with the treatment lagoon. The liquid was applied to cropland (grassland) beside the lagoon. Perameters measured included BOD, COD, total solids, volatile solids, pH, and total gallons of influent and effluent; temperature, DO, pH and oxidation-reduction potential of the mixed liquor; distribution of effluent by irrigation; and odor associated with the area. Tentative conclusions were reached as a result of work to date: (a) The system is odorless. (b) The system provides a place to dispose of wastes at all times. (c) Nutrients are saved and are returned to the land. (d) With proper operation, runoff into streams and ditches is minimized. (e) Pollutional characteristics of all wastes are greatly lowered. (f) Cost of installation and operation do not appear to be excessive. (g) A relatively small amount of labor is required. (White-Iowa State)

FIELD TESTS OF OXIDATION DITCHES IN CONFINEMENT SWINE BUILDINGS,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
Don D. Jones, Donald L. Day, and James G. Converse.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 160-171. 15 fig, 1 ref.

Descriptors: *Farm wastes, *Hogs, *Rotors, Oxygen demand, Biochemical oxygen demand, Chemical oxygen demand, Waste water treatment.
Identifiers: *Oxidation ditch, *Confinement buildings, Total solids, Volatile solids.

Tests at the University of Illinois were conducted using two buildings with oxidation ditches. Detention time, rotor speed, rotor immersion, and loading rates were varied. Oxygen demand, solids, BOD and COD were measured periodically and plotted by a digital computer. Problems with foaming and ammonia odor were encountered, but solved by altering the liquid depth and rotor immersion. Apparently the velocity of the waste in the ditch seems to be the controlling factor in oxidation ditch operation. Adequate velocity and oxygenation occurred when the immersion of the aeration rotor into the waste was equal to approximately one-third of the liquid depth. A liquid volume of 200 to 250 cubic feet of ditch volume per foot of rotor length served to maintain a velocity that prevented solids from settling in the ditch. With sufficient gutter volume to give 50 days detention time, the aerobic digestion process can reduce the 5-day BOD of hog waste from approximately 35,000 mg/l to around 3000 mg/l. (White-Iowa State)

STUDY OF THE USE OF THE OXIDATION DITCH TO STABILIZE BEEF ANIMAL MANURES IN COLD CLIMATE,
Minnesota Univ., Minneapolis.
J. A. Moore, R. E. Larson, and E. R. Allred.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 172-177. 3 fig.

Descriptors: *Farm wastes, *Climates, *Air temperature, Biochemical oxygen demand, Chemical oxygen demand, Cattle, Rotors, Stabilization, Waste water treatment.
Identifiers: *Oxidation ditch, *Slatted floor.

When loaded at the rate of one animal per 210 cu. ft. of liquid it appears that the oxidation ditch can be operated in cold weather. From results of this trial it can be projected that the oxidation ditch can successfully function to contain and provide minimal treatment to beef cattle wastes in cold climate with the pollutional threat stored until spring. At that time the liquid which is too polluted to be discharged to a waterway might be applied to a receptive soil media for further treatment. The results of a summer operation at a loading rate of one animal per 140 cu. ft. of liquid, indicate that the system achieved an 87% reduction of 5 day BOD. Additional treatment will be required however, because the BOD of the slurry was 22,000 mg/l at the end of the test period. Results indicate that the oxidation ditch system can be used to treat beef waste in climates which experience extended periods of sub-freezing temperatures, although digestion is minimal at these temperatures. Some foaming resulted but was not a limiting parameter. Normal operation has resulted in a low odor level. Sludge buildup was not a problem with an annual cleanout cycle. (White-Iowa State)

CHANGES IN COMPOSITION OF CONTINUOUSLY AERATED POULTRY MANURE WITH SPECIAL REFERENCE TO NITROGEN,
Guelph Univ. (Ontario).
J. B. Edwards, and J. B. Robinson.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 178-184. 5 fig, 2 tab, 8 ref.

Descriptors: *Farm wastes, *Nitrogen, Poultry, Aeration, Nitrification, Denitrification, Oxidation-reduction potential, Rotors, Waste water treatment.
Identifiers: *Nitrogen loss, *Oxidation ditch.

The objectives were (a) to study the nitrogen transformation in continuously aerated liquid manure, (b) to determine the most efficient means of eliminating nitrogen from waste (for situations in which sufficient land is not available to meet guidelines for pollution control) and (c) to determine what steps must be taken to prevent losses of nitrogen from liquid manure (for situations in which crop utilization is an integral part of the operation, and sufficient land is available). The study was limited to liquid poultry manure and this report deals, in a preliminary way, with changes in nitrogen components in such waste continuously aerated in both laboratory units and in an oxidation ditch. The results show that the mechanical rotor as operated was not capable of maintaining strictly aerobic conditions in the ditches for more than a few days. In spite of this, odor did not become a problem. From the limited data obtained, the oxidation ditch appears to be a useful device for controlling the ultimate nitrogen content of the manure before land utilization. By encouraging the nitrification-denitrification sequence nitrogen can be removed and, presumably, by inhibiting nitrification, nitrogen could be conserved. (White-Iowa State)

FARM WASTE DISPOSAL FIELD STUDIES UTILIZING A MODIFIED PASVEE OXIDATION DITCH, SETTLING TANK, LAGOON SYSTEM,
Farmland Industries, Inc.
Gerald R. Foree, and Richard A. O'Dell.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 185-192. 7 tab, 6 fig, 8 ref.

Descriptors: *Farm wastes, *Hogs, *Lagoons, *Efficiencies, Dissolved oxygen, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen-ion concentration, Waste water treatment.
Identifiers: *Oxidation ditch, *Settling tank, Total solids, Fixed solids, Volatile solids.

The system studied was two buildings, capable of holding 10 sows and litters apiece, located over oxidation ditches. The ditches emptied into a settling tank which in turn emptied into a lagoon. Measurements of dissolved oxygen, temperature, pH, BOD, COD, various solids determinations, various nitrogen determinations, and bacterial quantitation were taken and presented in 7 tables and 5 graphs. The data indicated that the oxidation ditch itself operated at approximately 50% efficiency under optimum operating conditions. The total system

ditch, settling tank and lagoon appeared to operate between 70 and 90 per cent efficiency, depending on the research parameter studied. (White-Iowa State)

TREATMENT OF WASTES FROM BEEF CATTLE FEEDLOTS - FIELD RESULTS,
Cornell Univ., Ithaca, N.Y.
Raymond C. Loehr.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 225-241. 8 fig, 4 ref.

Descriptors: *Farm wastes, *Cattle, *Anaerobic conditions, Alkalinity, Biochemical oxygen demand, Chemical oxygen demand, Ammonia, Nitrates, Nitrites, Rainfall, Water pollution, Digestion, Waste water treatment.
Identifiers: *Feedlots, *Aerobic stabilization, *Polishing unit, *Intermittent loading, Volatile acids, Volatile solids, Total solids, Turbine blower.

Results are presented from a field demonstration study to investigate an anaerobic-aerobic treatment system for beef cattle feedlot waste water, some of the management aspects of such a system are discussed, and data are presented on the quality of runoff from beef cattle feedlots. The demonstration system consisted of a 40,000 gallon anaerobic unit which overflowed into a 15,000 gallon aerobic unit. Aerobic stabilization was accomplished by means of a turbine blower and a simple diffuser system. The effluent from the aeration unit flowed to a polishing unit which provided for separation of the residual solids. The ability of this system to reduce the pollution from feedlot runoff was demonstrated. The system was able to absorb shock loads of waste that were periodically scraped into the anaerobic unit. The results of the study showed that frequent addition of wastes to the system, frequent mixing of the anaerobic unit, and removal of only a portion of the contents of the anaerobic unit materially assisted the satisfactory performance of the unit and the maintenance of equilibrium conditions. The individual units have been shown to function adequately with a minimum of attention. Further treatment would be required before the effluent could be released to a receiving stream. MANURE CONSERVATION,
HUPSI Corp., Wabash, Ind.
Robert M. LaSalle, Jr., and Mark Launder.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 245-248. 1 fig.

Descriptors: *Farm wastes, *Fertilizers, Poultry, Potash, Air-conditioning, Gross profit, Costs, Dehydration, Waste water treatment.
Identifiers: *Phosphoric acid, Anhydrous ammonia, *Manure conservation.

Tests were conducted in the fall and winter of 1967 on a proposed system of manure conservation. Poultry manure was stabilized and used as a fertilizer rather than going through a bio-degradation process. Troughs were placed under the chickens and a weak phosphoric acid solution flowed by gravity under subsequently lower cage levels and finally into a sump from which it was pumped to the upper most levels. Droppings were immediately stabilized, denatured, and deodorized upon falling into the solution. Additional treatment consists of buffering to reduce the acidity to the proper value for fertilizer and adding potash to increase the potash values to that commensurate with the nitrogen and phosphate analysis for commercial use. Buffering can be done with anhydrous ammonia or potash so that either the nitrogen or potash values are augmented. By these means control is available to bring the final product to any desired fertilizer analysis. An analysis of 10-3-2 can command a price of $61.60 per ton with a gross profit of $14.50 if dehydration is used. By refrigerating the solution flowing under the chickens, the chicken house is completely and perfectly air conditioned. (White-Iowa State)

CAGED LAYER PERFORMANCE IN PENS WITH OXIDATION DITCHES AND LIQUID MANURE STORAGE TANKS,
Guelph Univ., (Ontario). Dept. of Poultry Science.
J. P. Walker, and J. Pos.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 249-253. 3 fig, 1 tab, 4 ref.

Descriptors: *Farm wastes, *Poultry, *Performance, Anaerobic conditions, Aerobic conditions, Mortality, Odor, Biochemical oxygen demand, Waste water treatment.
Identifiers: *Oxidation ditch, Feed conversion, Aerator, Population equivalent, Egg production.

The hen housed egg production, feed conversion and mortality performance of caged layers in a pen with oxidation ditches was slightly better than that of caged layers in pens with liquid manure, storage tanks. The odor in the pens with oxidation ditches was less offensive than in the pens with anaerobic storage. Aerators, however, should be installed outside the pen area. The tank design is very important from the standpoint of liquid circulation, and clean-out. A drain to a sump hole for cleaning is essential. The foaming problem, while controlled by commercial anti-foaming agents, limits the practical application of aerators for poultry until a more economical means is found. Cage systems that do not need dropping boards (eg. full stair-steps) should be used; this would eliminate shock loading, reduce odors and labor requirements. (White-Iowa State)

PROBLEMS AND PRACTICES IN SOME SYSTEMS OF MANURE HANDLING IN NORTHERN EUROPE,
Cornell Univ., Ithaca, N.Y. Dept. of Animal Science.
A. M. Meek, W. G. Merrill, and R. A. Pierce.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 254-259. 4 fig, 6 ref.

Descriptors: *Farm wastes, *Cattle, *Storage, Odor, Disposal, Waste water treatment.
Identifiers: *Dairy cattle, *Handling system, Slatted floors, Poisonous gases, Agitation, Free-stall housing.

Dairy manure handling systems and operations were visited in Scotland, England, Denmark and Sweden. The various types of systems consisted of under-building and outside-underground storage facilities with some type of pump or shuttle agitation system. Many incorporated steel or concrete slatted floors with manure storage pits underneath. Problems of odor and poisonous gases were discussed. A list of 15 safety points for the prevention of gas problems was given. Symptoms of gas poisoning were also listed. (White-Iowa State)

MICROBIOLOGICAL AND CHEMICAL CHANGES IN POULTRY MANURE ASSOCIATED WITH DECOMPOSITION AND ODOR GENERATION,
Cornell Univ., Ithaca, N.Y. Dept. of Food Science.
William E. Burnett, and Norman C. Dondero.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 271-291. 18 fig, 1 tab, 5 ref.

Descriptors: *Farm wastes, *Poultry, *Odor, Aerobic bacteria, Anaerobic bacteria, Ammonia, Hydrogen sulfide, Sulfur bacteria, Waste water treatment.
Identifiers: *Olfactory threshold test, *Odor Intensity Index, *Threshold odor numbers, Uric acid, Odor panel, Volatile organic acids.

Changes in the microbial and chemical composition of batch lots of 'dry' and 'liquid' poultry manure during decomposition were related to the production of offensive odors. The decomposition of uric acid by both aerobic and anaerobic uricolytic bacteria appeared to be related to the formation of significant quantities of ammonia. The number of sulfate-reducing bacteria, including Desulfovibrio species, increased during the course of decomposition of liquid poultry manure. These organisms were implicated as producers of some of the hydrogen sulfide in liquid poultry waste. There were apparent correlations between an increase in odor intensity of liquid manure with increased storage time and the concentrations of volatile organic acids, ammonia, and sulfides. CHEMICAL ASPECTS OF ODOR REMOVAL IN SOIL SYSTEMS,
Washington Univ., Seattle. Dept. of Civil Engineering.
R. C. Gumerman, and D. A. Carlson.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 292-302. 6 fig, 1 tab, 7 ref.

Descriptors: *Farm wastes, *Odor, *Hydrogen sulfide, Soil moisture, Waste water treatment.
Identifiers: *Soil filter, *Removal mechanism, Detention time, Reaction temperature.

On the basis of the data presented, it was found possible to postulate mechanisms which describe the removal of hydrogen sulfide species on soil in both wet and dry conditions. Removal of high concentrations of hydrogen sulfide from moving air streams is performed much more efficiently by dry soil than wet. Inter-related parameters which influence the removal of hydrogen sulfide by dry sterile soil are detention time, reaction temperature, amount of hydrogen sulfide entering, concentration of hydrogen sulfide, and the total flow rate. A method of design optimization is presented which determines for a given concentration and influent gas temperature, the total flow rate at which the maximum removal of hydrogen sulfide per unit time results. It is felt this design optimization method should be restricted to air streams containing only hydrogen sulfide, until further research delineates the removal mechanism for other odorous gases. (White-Iowa State)

POULTRY HOUSE DUST, ODOR AND THEIR MECHANICAL REMOVAL,
Harry J. Eby, and G. B. Willson.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 303-309. 1 tab, 5 fig, 6 ref.

Descriptors: *Farm wastes, *Poultry, *Odor, *Dusts, Filters, Waste treatment.
Identifiers: Foam pad filters, Clogging.

Tests of plastic foam pad filters as a method of trapping the odor carrying dusts from a poultry

house exhaust fan air stream have shown that foam pads of 10 to 40 pores per square inch are effective. However, the tests show that such pads become clogged with dust in about 6 to 9 hours of operation. Vacuum cleaning and water washing methods of cleaning for continued use were ineffective and the high initial cost of the foam filter material were deemed to make this method impractical. Tests of a device in which the exhaust air is deflected tangentially across a 1/2 inch mesh screen showed that such methods would remove at least a portion of the odor carrying dust. These were also deemed impractical in that the filter ability would appear to be a direct function of the relative humidity and as such would be the least efficient when low relative humidity within the poultry house would make the dust problem the greatest. Other methods of possible filtering techniques were discussed. (White-Iowa State)
W71-02736

CHARACTERISTICS OF AQUEOUS SOLUTIONS OF CATTLE MANURE,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
John C. Ward, and E. M. Jex.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 310-326. 5 fig, 4 tab, 25 ref.

Descriptors: *Farm wastes, *Cattle, *Aqueous solutions, Biochemical oxygen demand, Dissolved solids, Hydrogen ion concentration, Foaming, Oxidation-reduction potential, Coagulation, Waste water treatment.
Identifiers: *Volatile solids, *Colloidal properties, Activation energy.

The primary objective was to investigate the aqueous characteristics (biochemical oxygen demand, conductivity, pH, oxidation-reduction potential, coagulation and colloidal properties, dissolved solids, volatile solids, and foaming) of solutions of cattle manure containing the combined urine and feces present in samples from cattle feedlots. This information could then be used in the design of facilities for treating runoff from cattle feedlots. It was assumed that treatment of this runoff would probably be by means of lagoons used to capture the runoff, and that these lagoons would be artificially aerated. In this type of aerobic treatment, the biochemical oxygen demand is satisfied in much the same way as in a stream. Formulas were developed and explained and 25 references were utilized. THE INFLUENCE OF VARIOUS FACTORS ON POULTRY LITTER COMPOSITION,
Pennsylvania State Univ., University Park. Dept. of Animal Science.
F. F. El-Sabban, T. A. Long, R. F. Gentry, and D. E. H. Frear.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 340-346. 4 tab, 18 ref.

Descriptors: *Farm wastes, *Poultry, Nitrogen, Carbohydrates, Insulation, Ventilation, Mineralogy, Moisture, Correlation analysis, Nutrients, Waste water treatment.
Identifiers: *Litter composition, *Nutritive value, Dry matter, Crude protein, True protein, Ether extract, Crude fiber.

A study was conducted to determine the chemical composition of poultry waste (litter and manure), relevant to its possible utilization as a source of nutrients. Litter samples were obtained from 33 broiler houses and 22 laying houses. Fresh manure was secured from 5 houses having layers in cages. The dry matter content was determined and samples were analyzed for crude protein, true protein, crude fiber, ether extract, and total ash. In addition, twelve mineral elements were determined. Poultry litter was found to contain considerable amounts of nutrients, particularly nitrogen and carbohydrates. Various factors such as bird type, bird density, kind of litter base material, litter depth, and poultry house conditions (ventilation, insulation, and house temperature) were all found to affect the proximate components of poultry litter. If poultry waste is to be utilized for its nutritive value for plants or animals, it is recommended that each batch be chemically analyzed before use. Although a limited number of samples was available, variation in composition was sufficient to warrant their individual analysis. (White-Iowa State)

REMOVAL OF WATER FROM ANIMAL MANURES,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
A. T. Sobel.
Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 347-362, 1969. 8 fig, 2 tab, 12 ref.

Descriptors: *Farm wastes, *Poultry, *Moisture content, Odor, Weight, Volume, Humidity, Waste water treatment.
Identifiers: *Equilibrium moisture content, *Relative humidity, Handling characteristics, Volatile solids, Drying times, Thermal removal.

The removal of water from animal manures changes the handling characteristics of the manure, reduces the weight and volume to be handled, and reduces the offensive odor of the manure. Water can be removed from manure by mechanical, thermal, and absorptive means. Mechanical methods such as direct pressing present the difficulty of the removed water containing considerable volatile solids. Thermal removal was investigated from the standpoint of utilizing a thin layer, unheated air, and very low or 'static' air velocity. The equilibrium moisture content of chicken manure is comparable with other agricultural hygroscopic materials. Equilibrium moisture content values are presented for temperatures 70, 90, 110F. Drying times for chicken manure under these conditions is in terms of days. Drying times are greatly influenced by sample variation. Effects of humidity on drying time are significant but sample variation has an effect similar to a plus or minus 15% relative humidity change. Moisture loss from a 'deep' layer of manure is less than that from a free water surface. (White-Iowa State)

RELATIVE ECONOMICS OF ANIMAL WASTE DISPOSAL BY SELECTED WET AND DRY TECHNIQUES,
Resource Engineering Associates, Inc., Stamford, Conn.
Robert W. Okey, Robert N. Rickles, and Robert B. Taylor.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 369-387, 1969. 5 fig, 17 tab, 11 ref.

Descriptors: *Farm wastes, *Cattle, *Cost analysis, Effluent, Biochemical oxygen demand, Chemical oxygen demand, Odor, Aeration, Nitrogen, Denitrification, Ultimate disposal, Incineration, Waste water treatment.
Identifiers: Wet systems, Dry systems, Effluent standards, Clarifier systems, Biological conversion, Solids conditioning system, Scrubbing system, Ancillary system.

The report presents the basic elements required for the design of two waste treatment facilities to handle the wastes from feedlots carrying 500, 1000, 5,000, 10,000, and 25,000 animals. The plants were designed to meet specified liquid and gaseous effluent standards. The standards selected are believed to be consistent with present and projected effluent requirements. It should be noted that some water courses may not be able to assimilate effluents of the quality discussed here. The two systems designed and costed in this work employed on one hand more or less conventional liquid waste treatment procedures; the other employed incineration and treated the undiluted animal waste as delivered as a solid waste, i.e., sludge. The capital and operational cost of these systems were computed and related to the number of animals and the gain anticipated in the feedlot. A waste treatment cost in terms of animal-years and per pound was then obtained. Five conclusions were reached as a result of the study, among them, that wet systems are more expensive to own and operate than systems designed to handle solids. (White-Iowa State)

THE ECONOMICS OF POULTRY MANURE DISPOSAL,
New York State Coll. of Agriculture, Ithaca.
R. E. Linton.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 388-392, 1969.

Descriptors: *Farm wastes, *Poultry, *Economics, *Land use, Fertilizers, Nitrogen, Phosphorus, Potash, New York, Disposal, Waste water treatment.
Identifiers: *Land disposal, *Cost calculations, *Waste management, Transportation costs, Catskill resort industry.

This study was initiated in response to the general problem of conflicts over rural land use, particularly those involving farm operations. More specifically and as a notable example, the study dealt with the problems of conflict between poultry and other land uses. The problem of land use conflict related to waste management was approached through the aspect of recognizing the internal costs to farmers of some of the alternatives in waste management. As a result of the study one particular pattern of manure disposal seemed to justify serious consideration and was singled out for discussion and cost calculations. This pattern included some means of land spreading as a practical and acceptable disposal method. Comments were made about the value of poultry manure in replacing commercial fertilizer, and this value is discussed as a means of at least partial disposal cost recovery. (White-Iowa State)

ECONOMIC RETURN FROM VARIOUS LAND DISPOSAL SYSTEMS FOR DAIRY CATTLE MANURE,
Cornell Univ., Ithaca, N.Y.
L. W. McEachron, P. J. Zwerman, C. D. Kearl, and R. B. Musgrave.
Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 393-400, 1969. 11 tab, 13 ref.

Descriptors: *Farm wastes, *Fertilizers, *Rotations, Cattle, Economics, Soil types, Disposal, Waste water treatment.
Identifiers: *Dairy cattle, Land disposal, Continuous corn, Lima silt loam, Manure hauling and spreading, Total digestible nutrients.

Census of Agriculture data are presented to indicate that dairy cattle manure could well be disposed of on the land. Farm cost accounting data are presented to indicate that cost per ton of hauling and spreading averaged $1.92 for farms with free stalls and about 140 cows to $3.18 for those with stanchions and 65 cows. Percent yield increase on crops grown per ton of manure applied range from .4% for oats to 6.6% for alfalfa. These

percent yield increases were generalized without regard to mineral fertilization and applied to Warren's (1968) yield data for the state of New York at various farming levels. Without a charge for hauling and spreading dairy cattle manure crop yield returns ranged from $1.42 per tone to a deficit of $0.26. (White-Iowa State)

ECONOMIC EVALUATION OF LIQUID MANURE SYSTEMS FOR FREE STALL DAIRY BARNS,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Economics.
George L. Casler.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 401-406, 1969. 3 tab.

Descriptors: *Farm wastes, *Economics, *Value, Cattle, Costs, Odor, Fertilizer, New York, Waste water treatment.
Identifiers: *Liquid manure system, *Labor distribution, *Labor requirements, Dairy cattle, Free stall barns.

The purpose was to evaluate liquid manure systems in free-stall dairy barns primarily from an economic viewpoint. If a liquid manure system is to be justified, such justification will have to be based on other advantages in addition to increased manure value and reduced labor requirement. The primary other advantage is the possibility of not hauling manure at periods of peak labor demand for planting and harvesting crops. However, to actually reap the benefits of improved labor distribution, a dairyman needs a reasonably long storage period and must very carefully plan his cleaning schedule. In addition, the very unpleasant odor created at the time the storage tank is emptied precludes the use of a liquid manure system in areas where neighbors would object to this odor. It appears to the author that the air pollution or odor problem is much more serious with a liquid manure system than with daily apreading. (White-Iowa State)

WHO SHOULD REGULATE POULTRY CONFLICT PROBLEMS,
Cornell University, Ithaca, N.Y. Coll. of Agriculture.
David J. Allee, and Pierre Clavel.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, p 407-414, 1969. 5 ref.

Descriptors: *Farm wastes, *Poultry, *Technology, Local governments, State government, Odor, Communication, Waste water treatment.
Identifiers: *Regulatory mechanisms, Industry committee, Political resources, Waste management technology, Conflict, Resolution of problems.

Economic and social theory applicable to conflict situations, such as those that arise downstream or downwind from poultry houses, has some ability to indicate directions for administered solutions to these problems. Based upon such theory, related research and a case study of a number of ways in which rural communities have dealt with situations of stress between components of the community, the outlook for regulatory devices is appraised. An informal voluntary industry committee approach is found to be as effective in bringing together necessary technical expertise and social regulatory mechanisms as any other approach which the limited resources of many rural communities can support. It is suggested that because of a shortage of administrative and political resources many rural areas will resist effective resolution of conflict problems due to agricultural wastes until finally controls will be imposed by essentially urban oriented units of government. BEEF CONFINEMENT SYSTEMS - OXIDATION DITCH,
Minnesota Univ., Minneapolis. Dept. of Agricultural Engineering.
J. A. Moore, R. E. Larson, R. O. Hegg, and E. A. Allred.
Paper No 7331 in the Scientific Journal Series, Minnesota Agricultural Experiment Station; and Paper No 70-418, American Society of Agricultural Engineers, July 1970.

Descriptors: *Farm wastes, *Cattle, Chemical oxygen demand, Biochemical oxygen demand, Ventilation, Rotors, Foaming, Temperature, Hydrogen-ion concentration, Dissolved oxygen, Nitrogen, Ammonia, Waste water treatment.
Identifiers: *Oxidation ditch, Beef cattle, Loading rates, Solids.

The oxidation ditch has been used in Minnesota for two years for treatment of beef cattle wastes. It has been operated as a batch system with various loading rates and environmental conditions. Results are evaluated on the basis of BOD, COS, TS, TVS, pH, nitrogen, temperature of the waste, and odor and foam control. Waste management systems are employed by beef operators to meet certain objectives. These objectives may vary widely depending on such factors as management, labor requirements, climate, size and nature of operation, land availability, soil type and geologic formation and population density. No one waste system is best for all operations. Each system has advantages and disadvantages to offer for any given operation. The oxidation ditch offers the following characteristics: very low odor level, waste storage eliminates runoff, volume reduction of solids, reduction of pollution strength, concentration of some elements, necessity of continuous operation, one of more expensive treatment systems, and a buildup of solids on the bottom. Based on the results obtained from 2 1/2 years of research the authors feel that the oxidation ditch does have a place in treating beef cattle waste from confinement operations. (White-Iowa State)

5E. Ultimate Disposal of Wastes

A DESIGN STUDY ON THE ECONOMIC USE OF AGRICULTURAL WASTES IN KANSAS.
Kansas Dept. of Economic Development.

Available from NTIS as PB-194 368, $3.00 in paper copy, $0.95 in microfiche. Kansas Planning for Development Report No 25, Jan 1969. 183 p, 32 tab, 11 fig, 625 ref. HUD Grant to Kansas Department of Economic Development.

Descriptors:
Identifiers: *Agricultural wastes, Utilization, *Waste disposal, Effectiveness, *Economic development, *Kansas, Management planning, Benefit cost analysis, Research projects, Environmental engineering, Water pollution, Control.

The report represents a study of agricultural wast in Kansas and the technology available f economic utilization. The principal wastes that m provide raw materials for profitable utilization a identified and data on location and quantity of ea waste are presented. The most important agricu tural waste in Kansas comes from large catt feedlots. Since disposal is costly to the cattle fee ing industry utilization technology is sought to pr vide raw material for economic development.

METROPOLITAN WATER SYSTEM OPERATION SUBSEQUENT TO NUCLEAR ATTACK OR NATURAL DISASTER,
Dallas Water Utilities Dept. Tex.
Dan A. Brock.
Available from NTIS as AD-711 956, $3.00 in paper copy, $0.95 in microfiche. Final Report, May 1970. 364 p, 29 tab, 6 fig, 6 ref.

Descriptors:
Identifiers: *Water supplies, Management planning, *Nuclear warfare, Water supplies, Disasters, Mathematical models, Nuclear explosion damage, Vulnerability, Civil defense systems, Power supplies, Post attack operations, *Post attack planning, Computerized simulation, Post attack recovery.

The study develops methodology for creation of a plan for operation of a metropolitan water system subsequent to nuclear attack or natural disaster. Automatic digital computer water system simulation is used to determine the ultimate overall effect of damage to specific components. Vulnerability analyses are made as a mathematical model of the water system reacts automatically to hypothetical attack data supplied by the National Civil Defense Computer Center. Problems of unmanned water purification plant operation are noted. The need for and availability of electric power is considered.

A MODEL RELATING WATER QUALITY, VEGETATIONAL STRUCTURE AND URBANIZATION IN THE SAN JACINTO RIVER BASIN,
Houston Univ., Tex. Dept. of Biology.
David L. Jameson.
Available from NTIS as PB-196 094, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, December, 1970. 49 p, 11 tab, 2 fig, 8 ref. OWRR Project B-045-TEX (1).

Descriptors: Ecology, *Water quality, *Model studies, *Vegetation, *Urbanization, Texas, Biomass, Statistical models, Probability, Soil analysis, Data processing.
Identifiers: San Jacinto River Basin (Texas), Water quality models, River basin models.

This study was initiated to test the hypothesis that available information was sufficient to predict the relation between amount of urbanization and the quality of the water in the watershed of the San Jacinto River Basin. Chemical water quality measures are the published and unpublished records of the U.S. Geological Survey. Unpublished records of the Houston Water Department provided portions of the Biological Water Quality measures. Predictor variables included soil, weather, population characteristics, and estimates of vegetation type and urbanization obtained from aerial photographs. Factor, discriminant and canonical correlation analyses were used for data reduction. Two models were attempted. The first used the data to construct a matrix model of the relation between predictors and water quality. The second model used a probability distribution of biomasses in the vegetational community to examine the reduction in the community possible without destroying the community and thus destroying the contribution of community to water quality. The results from both models were rejected because of the general incompleteness of the predictor data and because the available predictor data were not directly related to water quality in the areas where data were available. (Jameson-Houston)

INVESTIGATIVE MINE SURVEY OF A SMALL WATERSHED, A FIELD INVESTIGATION TO LOCATE AND DEFINE UNKNOWN OR HIDDEN DRIFT MINE OPENINGS IN THE BROWNS CREEK WATERSHED OF THE WEST FORK RIVER IN WEST VIRGINIA.
Halliburton Co., Duncan, Okla.

Available from NTIS as PB-196 110, $0,95 in microfiche. Available from SOD as: SOD No 167.13/4:14010 DMO 03/70 PC$2.00. Water Pollution Control Research Series 14010 DMO-A, March, 1970. 89 p, 16 tab, 32 fig, 4 ref, append. FWQA Program 14010 DMO, Contract NO 14-12-453.

Descriptors: Drift mining, Mining, Mining engineering, West Virginia, *Strip mines, Mine drainage, Water pollution control, Mine water, Exploration.
Identifiers: Mine surveys, Browns Creek watershed (West Virginia), *Mine openings (Hidden), Auger Probes, Mines drifts, Highwall location (Mines).

The primary purpose of this project was to conduct an investigation to locate hidden or unknown drift mine openings in the Browns Creek Watershed in Harrison County, West Virginia. Thirty unknown openings were discovered in an initial reconnaissance. Additional probing using power driven augers was not successful and was deemed impractical. Three specific areas within the watershed were selected for further scrutiny. The bottom of the highwall line in the strip mined area was determined by land surveyors and this information was plotted on old mine maps to indicate the intersection of the stripping with underground mining. A minimum of 107 mine drifts were shown to be exposed by the 14,500 feet of highwall surveyed in the three areas.

Descriptors: *Mine drainage, Mine acid, Mine wastes, *Mine water, *Acid mine water, Bacteria, *Ferrobacillus, *Thiobacillus, Effluents, Aeration, *Pyrite, Acidic water, *Coal mine wastes, Iron, Sulfate.
Identifiers: *Chemoautrophic microorganisms, Mine models, Algal growth, Ferrobacillus ferrooxidans, Ferrobacillus sulfooxidans, Thiobacillus thiooxidans.

The role of chemoautrophic organisms in the formation of acid mine drainage from pyritic materials associated with coal mining has been investigated by pilot plant techniques. Dynamic flow, controlled environment units which served as models of mines were used. It was demonstrated that the concentration of acidity, ferrous and total iron and sulfate in the effluent from aerobic, biologically-seeded or unseeded pyritic beds is zero order with respect to flow, except at low flow rates where mass transport is diffusion limited. Algal growth occurred in the acidic, aerobic environment but did not affect acid production. Nonaerobic systems produce acidity consisting only of ferrous iron. Total acidity is lower from biologically-seeded than -nonseeded aerobic systems. Acid mine drainage was not significantly affected by seeding with the individual or a mixture of three different organisms but was increased by recycle of the flow and increased appreciably under forced aeration. The rate is directly related to the available pyrite surface area. (Shackelford-FWQA)

A HYDROLOGICAL APPROACH TO CONTROL ACID MINE POLLUTION FOR LAKE HOPE,
Ohio Univ., Athens. Dept. of Geology.
Moid Uddin Ahmad.
Goundwater, Vol 8, No 6, p 19-24, November-December 1970. 6 p, 14 fig, 4 ref.

Descriptors: *Acid mine water, *Water pollution control, *Ohio, *Water pollution sources, *Groundwater movement, Acid streams, Mine acids, Mine drainage, Injection wells, Drainage systems, Subsurface drains, Appalachian Mountain region.
Identifiers: Acid mine drainage, Mine acid control, Vinton County (Ohio).

In the Appalachian region, coal mining has disturbed the natural ground flow system. The mines are continuously being flushed by this disturbed flow system and are producing sulphuric acid. In the McDaniel Mine, Ohio, the flow is lateral and clay layers under the coal do not allow water to leak into the underlying aquifer. Water well logs collected within 10 moles of the Todd Mine show the existence of three separate aquifers. A pilot plan for Todd Mine proposes to discharge the uncontaminated water from the upper aquifer to the lower aquifer, and should stop the flow of water through the mine. This scheme is intended to solve the serious problem of pollution of Lake Hope, Ohio. (Knapp-USGS)

ECONOMIC CONSIDERATIONS IN THERMAL DISCHARGE TO STREAMS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
George O. G. Lof, and John C. Ward.
In: Engineering Aspects of Thermal Pollution, Chapter 10, p 282-301, 1969.

Descriptors: *Thermal pollution, *Cooling water, *Economics, Temperature, Thermal power plants.
Identifiers: *Thermal discharge, Evaporation losses.

The economic consequences of thermal discharge from steam-electric power plants, the largest users of cooling water, are modest increases in operating costs by the downstream users. It is observed that the operating cost of recirculation cooling merely to reduce the temperature of an inlet cooling water supply is greater than the benefit. The annual expense C sub I in cents per thousand gallons of water circulated is given in terms of the cooling tower investment per unit capacity (dollar/gpm); r, the interest rate; t, cooling tower service life (years); P, annual property-taxation rate; and N, the load factor. Costs of operation are functions of R, the cooling range in F; C, the cycles of concentration; Y, alkalinity of make up water; W sub a, cost of make up water; K, the relative rating factor of cooling tower, p, the height to which water must be pumped for flow through the cooling tower (feet); and A, cost of electric power (cents/kwhr). Results of a downstream power plant using warmer condenser water than would naturally have been available are a decrease in total electrical generation and a decrease in thermal efficiency, hence, an increase in costs per kilowatt-hr generated. The net additional cost of powerplant due to such temperature increase, can be expressed in terms of theoretical steam cycle efficiency, turbine generator efficiency, fractional decrease in plant load factor per year, the temperature change in the water steam, present load factor of the plant, the powerplant life, and the natural temperature of cooling water unaffected by thermal discharge upstream. RESEARCH NEEDS FOR THERMAL POLLUTION CONTROL,
Federal Water Pollution Control Administration, Corvallis, Oregon. Pacific Northwest Water Lab.
Bruce A. Tichenor, and William A. Cawley.
In: Engineering Aspects of Thermal Pollution, Chapter 12, p 329-338, 1969.

Descriptors: *Thermal pollution, *Temperature, Ecology, Thermocline, Hypolimnion.
Identifiers: *Research needs, Treatment processes, Non-treatment control technology transfer.

The research needs for thermal pollution control are segmented into transport and behavior of heat in water, and treatment processes and non-treatment controls. More information is needed on what happens when a heated discharge is inserted in either the thermocline or hypolimnion of a stratified reservoir. Other important items are, development of non-empirical, stochastic temperature-prediction models, improvement of the effectiveness of cooling devices for handling large thermal loads and development of methods for effectively utilizing waste heat including industrial and agricultural use. In considering research needs, it is important to recognize that research involves several levels of activities which include, scientific advancement, fundamental development, design and application and technology transfer. Each of three segments of our society, the regulatory agencies, the pollution and the water user should carry a fair share of responsibility. An interdisciplinary research effort to control thermal pollution, calling for the participation of all relevant segments of technical community is needed. (See also W71-02478) (Upadhyaya-Vanderbilt)

CONTROL OF ODORS FROM ANIMAL WASTES,
W. E. Burnett, and N. C. Dondero.
Transaction of the ASAE, Vol 13, No 2, p 221-224, 231, March 1970. 3 fig, 5 tab, 15 ref.

Descriptors: *Farm wastes, *Poultry, *Odor, *Chemicals, Costs.
Identifiers: *Odor panel, *Masking agents, *Counteractants, Deodorants, Digestive deodorants, D-indices.

A matching-standard method was successfully used for the evaluation of the ability of commercial odor-control chemicals to mask or eliminate the offensive odor of poultry manure when added directly to the waste in both loboratory and field tests. The method enables one to find the most effective chemicals in a systematic and relatively time-saving manner. The method provides information on the lowest concentration of chemical necessary to obtain a desired effect. Masking agents and counteractants were found to be the most effecti odor-control products, deodorants were moderat ly effective, and digestive deodorants were least e fective. The cost in some field trials was estimate to be 63 cents per 450 gal. of liquid manur Further research is needed on the effect of r peated applications of odor-control products c soil, so as not to harm the soil for other purpose (White-Iowa State)

SOME ECONOMIC PLANNING CONSIDERA TIONS OF GROUNDWATER POLLUTION FO THE UPPER PAWCATUCK RIVER BASIN I RHODE ISLAND,
Rhode Island Univ., Kingston. Dept. of Econom Planning and Regional Development.
Arnold Joseph Antak.
Masters Thesis, 1970. 119 p, 8 fig, 23 tab. OWR Project A-032-RI (1).

Descriptors: *Water supply, *Groundwate *Economics, *River basin development, Optimu development plans, Project planning, Long ter planning, Water pollution control, Water manag ment (Applied), Water resources developmer Water sources, Planning, Rhode Island.
Identifiers: *Pawcatuck River Basin, R. *Groundwater pollution.

This thesis is concerned with the economics of su plying potable water to the Upper Pawcatuck Riv Basin in Rhode Island. The basic question co sidered was whether or not it is more economical develop and maintain pollution - free the lar groundwater reserves in existence there, or to n protect these groundwaters, and instead, develop surface water supply. Groundwater developme and protection would consist of a large municip well development and regional sewerage faciliti to prevent the private disposal of sewage. Altern tive development of a surface water supply wou require an impounding reservoir. It was found th no serious groundwater pollution proble presently exists, but that the potential for futu problems does exist. Cost data were obtained fro various sources and estimates of the development costs of regional sewerage facilities, municip groundwater development, and a surface impoun ing reservoir were made. It was found that the cor bination of groundwater development, and region sewerage was less expensive than the developme of a surface water supply for systems of simil capacity. It is recommended that the planning water supplies and sewerage be done on a cor prehensive basis by considering them as a sing function. (Hewett-Rutgers)

PRINCIPLES AND PRACTICES OF BEEF CA TLE FEEDLOTS,
Queensland Univ., Brisbane (Australia). Dept. Animal Husbandry.
W. J. Pryor.
Australian Veterinary Journal, Vol 46, No 4, Ap 1970, p 173-177. 2 tab, 1 fig, 17 ref.

Descriptors: *Cattle, *Animal diseases, *Cost Profit, Nutrient requirements, Silage, Sorghu Wheat, Performance, Water pollution control.

Identifiers: *Feedlots, Feelot management, Feeding systems, Green chop.

It is believed the emergence of a large feedlot industry will be dependent primarily on two factors, the first being the availability of cheap feed and the availability of store cattle at a price which will permit a margin after they have been lot fattened, and the other, the introduction of a satisfactory national system of carcass grading and identification. A description is given of the principles involved in the management of feedlots with special reference to conditions operating in northern Australia. The importance of concentrate to roughage ratios and protein and mineral requirements are stressed. Diseases have played only a minor part in feedlot management in Australia thus far, and it is suggested that the veterinarian can play a more useful role in supplying sound advice on economic feeding and management. REFLECTIONS ON POLLUTION CONTROL,
Zurn Industries, Inc., Washington, D.C.
Leon W. Weinberger.
In: Animal Waste Management, Proceedings, Cornell University, Conference on Agricultural Waste Management, p 1-3, 1969.

Descriptors: *Farm wastes, *Water pollution, *Water quality, *Cost-benefit ratio, Water pollution control, Environment, Waste water treatment.
Identifiers: *National policy, National misconception.

Dr. Weinberger expresses three personal viewpoints dealing with national policy on water pollution control, cost benefit analysis in water pollution control, and finally comments on the greatest myth or misconception in water pollution control. This national misconception being that we do not know how to solve the problems of water pollution control. Dr. Weinberger asks everyone to speak out and be heard on the way that you want to have our environment. (White-Iowa State)
W71-02702

EFFECTS OF WATER QUALITY STANDARDS ON THE REQUIREMENTS FOR TREATMENT OF ANIMAL WASTES,
Federal Water Pollution Control Administration, Washington, D.C.
Harold Bernard.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 9-16. 1 tab, 2 fig, 5 ref.

Descriptors: *Farm wastes, *Legal aspects, *Water quality act, Biochemical oxygen demand, Chemical oxygen demand, *Water quality standards, Municipal wastes, Industrial wastes, Waste water treatment.
Identifiers: FWPCA, Animal feedlot, *Disposal requirements, *Waste treatment standards, Environmental backlash, Interstate waters.

Changes that have taken place in water quality standards are discussed. The purpose of the standards is to: (a) provide an engineering base for the design of waste treatment works by municipalities and industries without uncertainties in waste disposal requirements in interstate waters. (b) Serve as a clear public (local) policy statement on the use or uses to which specific segments of interstate waters may be put after due consideration of all the factors delineated above. The effect of these changes in standards is discussed with relation to the treatment of animal wastes. Future municipal B.O.D. loads and their subsequent treatment costs are brought out. It is mentioned that the FWPCA is interested in receiving proposals to demonstrate new or unique treatment and control techniques for animal wastes, especially in conjunction with an on-going operation. Only with the cooperation and leadership of the industry itself can techniques be developed to meet the various water quality standards and enable the industry a growth unimpeded by any environmental backlash. (White-Iowa State)

THE CHALLENGE OF ANIMAL WASTE MANAGEMENT,
Cornell Univ., Ithaca, N.Y.
Raymond C. Loehr.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 17-22. 5 ref.

Descriptors: *Farm wastes, Odors, Waste water treatment.
Identifiers: *Animal production, *Waste management, Environmental quality, Interrelationships of animal production, Study and research.

There is a woeful lack of understanding of the interrelationships between various aspects of animal production and waste management. It is to this point and to these relationships that this paper is addressed. The long term approach for animal production must be based upon not only optimal production of the product, but also on management of the entire production scheme such that it is consistent with the maintenance of acceptable environmental quality not only to the animals, and to the producers, but to society as a whole. The problem of animal waste management is actually many problems. It consists of technical, economic, social, educational, and perhaps above all, a communications problem. The talents of individuals from many disciplines are needed to produce better solutions to the problem. We need to initiate more studies that will take an overview of the animal production operation, feasible waste management systems, and their interrelationships. These studies should develop information that can be used as predictive and/or decision making tools to anticipate and minimize problems that may result. Herein lies the greatest challenge of animal waste management. (White-Iowa State)

FEEDLOT POLLUTION CONTROL - A PROFILE FOR ACTION,
Federal Water Pollution Control Federation, Kansas City, Mo. Missouri Basin Region.
John M. Rademacher, and Anthony V. Resnik.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 193-202. 17 ref.

Descriptors: *Farm wastes, *Water pollution control, *Legislation, Groundwater, Water Quality Act.
Identifiers: *Feedlots, *Animal production, Research, Regulation.

This paper set the stage for the presentation of technical papers which followed at the Cornell University Animal Waste Management Conference. The background of animal production and examples of the pollution problem were given. Factors causing the problem of animal waste disposal were discussed as well as accomplishments to date. These accomplishments included Federal laws to control pollution. A profile for action was presented as a model for action. The essential elements were Re-education, Research and Regulation. He states that we have neither adequate knowledge for control nor full cooperation and involvement of all levels of Government and the private sector to solve the problems resulting from feedlot operations. More attention must be given to feedlot location and research devoted to the institutional problems of animal waste management. There must be an organized and coordinated, interdisciplinary approach to animal waste disposal. (White-Iowa State)

CATTLE FEEDLOT WATER QUALITY HYDROLOGY,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
T. E. Norton, and R. W. Hansen.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 203-216. 2 tab, 14 fig, 14 ref.

Descriptors: *Farm wastes, *Cattle, *Hydrographs, *Water quality, Rainfall simulators, Rainfall intensity, Biochemical oxygen demand, Runoff, Alkalinity, Water pollution control, Waste water treatment.
Identifiers: *Feedlot runoff, *Hydrology characteristics, Surface storage, Effective depth, Overland flow.

The hydrologic and quality characteristics of runoff waste water resulting from precipitation on cattle feedlots are presented. The overall objective of the study was to determine if the hydrology characteristics could be correlated with the quality characteristics through a modification of the flat plate model of overland flow. Once this correlation was established, the results were used to predict the quantity and quality of the runoff from existing feedlots. The field equipment consisted of rainfall simulation equipment and a sample collection and control device. Runoff was collected and analyzed from a 28 sq. ft. plot in 18 separate runs on 13 different feedlots. The pollution characteristics of BOD, dissolved solids and alkalinity were correlated with an effective depth of overland flow. The correlation method and equations developed were used in an example of BOD prediction. (White-Iowa State)
W71-02726

THE EFFECT OF FEED, DESIGN AND MANAGEMENT ON THE CONTROL OF POLLUTION FROM BEEF CATTLE FEEDLOTS,
Texas Technological Coll., Lubbock. Dept. of Agricultural Engineering.
W. Grub, R. C. Albin, D. M. Wells, and R. Z. Wheator.
In: Animal Waste Management, Proceedings Cornell University Conference on Agricultural Waste Management, 1969, p 217-224. 5 fig, 2 tab.

Descriptors: *Farm wastes, *Cattle, *Runoff, Biochemical oxygen demand, Nitrogen, Phosphorus, Water pollution control.

Identifiers: *Feedlots, *Composition of wastes, Rations, Feedlot layout, Waste accumulation.

Incorporating both engineering and biological aspects, this report contains an analysis of data and suggests management and design practices that could materially reduce the pollution contributed from the small but densely populated feedlot area. The composition and quantity of wastes is looked at. The type of ration and changes in accumulated wastes are discussed in relation to the former topics. The effects of precipitation, surfacing material, land slope, depth of waste accumulation, feedlot layout, and ration composition are discussed with respect to composition and quantity of runoff. (White-Iowa State)

Identifiers: *Livestock production, *Production efficiency, *Environmental quality, Quality standards, Public conern, Economic development.

The possibilities of merging the two objectives of production efficiency and environmental quality are explored. To establish a basis for merging the two objectives, the author discusses environmental quality, quality standards, and public concern. Secondly he reviews the changing concepts of economic efficiency and illustrates these changes by discussing four stages of economic development. The discussion is concluded with a section devoted to the merging of the two objectives, environmental quality and production efficiency. An impasses can be averted, but it will require new modes of thought, and constructive responses to new situations. (White-Iowa State)

EXTERNALITIES, OPTIMALITY AND INFORMATIONALLY DECENTRALIZED RESOURCE ALLOCATION PROCESSES,
Northwestern Univ., Evanston, Ill.
Antonia Camacho.
International Economic Review, Vol 11, No 2, p 318-327, June 1970.

Descriptors: *Resource allocation, *Economic planning, Input-output analysis, Economic environment optimization.
Identifiers: *Externalities, *Pareto-satisfactory, Adjustment process, N components, Cartesian product, Set theory.

This paper is mainly devoted to presenting an informationally decentralized adjustment process with Pareto-optimal equilibria for economies or environments where externalities exist. The economic environment is defined as the set of economic units or participants of the economy, their initial resource endowments, and their production possibilities and preferences. The n components of the environment uniquely determine the economic environment and its Pareto-optimal set. The adjustment process is defined as a set of rules for exchanging information among the economic units regarding their components of the environment in order to reach an agreement about an economic program for implementation. The informationally decentralized adjustment is shown to be external and anonymous. Furthermore, this process is Pareto-satisfactory since it is single valued, nonwasteful or Pareto-optimal and unbiased. This paper is relevant for water studies concerned with the theoretical basis of welfare analysis as it may apply to problems in water resource allocation. (Siegenthaler-Rutgers)

FACILITY PLANNING FOR A PUBLIC SERVICE SYSTEM: DOMESTIC SOLID WASTE COLLECTION,
University of Southern California, Los Angeles. Dept. of Urban and Regional Planning.
George P. Schultz.
Journal of Regional Science, Vol 9, No 2, p 291-307, August 1969.

Descriptors: *Decision making, Cost function, Bay, Solid waste system, Linear programing, Average cost.
Identifiers: *Facility planning, Collection cost, Planning period.

This paper develops a decision model for planning transfer stations used in an indirect haul system for domestic solid waste collection service. The objective is to minimize long run average cost per household subject to the constraint that a given quantity and quality of service be maintained. The model proposed allows for planning a new set of facilities and for the expansion of present facility capacity. The cost functions are estimated as well as the choice of values for the decision variable. The decision model is further subgrouped into submodels dealing separately with size, location and timing. The first submodel establishes facility capacity and service area for a hypothetical city. The second model distributes these facilities over the city and minimizes collection costs. The third submodel defines the optimal capacity increment and time interval for one facility serving an area having a linear population growth function. The techniques of this study may prove applicable to water waste disposal problems. (Siegenthaler-Rutgers)

Descriptors: *Land use management, *Econon efficiency, Economic rent, Constraint, Benefit-c analysis.
Identifiers: *Floodplain land use, *Recursive p graming, Objective function, Payoff, Present valu

Flood control projects such as levees, channel i provements, and reservoirs are no longer adequ methods for the prevention of flood damage a losses. This paper considers a floodplain land u management or nonstructural approach to urb land damage control. The model discussed enab nonstructural alternatives such as spatial planni site elevation and flood proofing to be evaluated a common basis with structural measures. T model developed uses recursive linear programi for allocating specific land uses to specific parts the floodplain. Alternative land uses which empl various levels of land fill and flood proofing evaluated according to the economic value a co munity gains from its lands. As a planning to given aggregate land use requirements, the mo evaluates nonstructural alternatives in terms their economic feasibility and effects on econon rents. Optimal land use activities are then select for various planning periods. This model is relev for water resource planners involved with floo plain management. (Siegenthaler-Rutgers)

Identifiers: *India.

Agricultural activities in India produce one-half the national income and employ three-fourths of the working class. A fundamental fact of life in India is the low per acre yield because of poor soil management practices and ignorance of modern techniques. Due to low, unpredictable rainfall, a large part of the country is designated marginal for agriculture. High efficiencies in conservation and use of water are crucial in these areas. Surface water supplies have been heavily utilized and the only possible improvements will involve more careful management for optimal utilization. For a number of reasons, groundwater supplies have been largely unutilized, although they offer the only other important water source during monsoon failure. The advantages and disadvantages of groundwater are discussed and it is felt that India may conveniently be divided into 5 regions for the purpose of undertaking a national regional groundwater survey with the purpose of locating and developing reliable groundwater supplies. A 5-phase program is outlined, organized around groundwater-flow systems analyses and efficient administrative organization. Tentative organizational flow charts are presented. (Casey-Arizona)

HOW GREEN IS THE GREEN REVOLUTION,
William C. Paddock.
BioScience, Vol 20, No 16, p 897-902, 15 August 1970. 15 ref.

Descriptors: *Water costs, *Irrigation programs, *Economic efficiency, *Economic impact, *Grains (Crops), Financing, Weather, Cost-benefit analysis, Cost transfer, Economic feasibility, Economic prediction, Arid lands, Tropical regions, Water allocation (Policy), Water resources, Water utilization, Water values, Water yield, Crop production, Political aspects, Population, Social impact, Social values, Wheat, Rice, Rainfall, Mexico, Agriculture.
Identifiers: *High-yield varieties, *Over population problems, *Green Revolution, *Under-developed countries, *Agricultural subsidies, Phillipines, India, Asia.

The author argues that the existence of a Green Revolution in the underdeveloped world is largely an illusion. The years of greatest success of the so-called Green Revolution (1967-1969) coincided with a period of unusually high rainfall in Asia and increases in production would have occurred with or without new technology. Only 2 high-yield crops have actually been developed: wheat and rice. Social factors in Asian countries militate against wheat, and rice yields have stagnated after early increases. Further, excessive concentration upon a limited number of varieties is decreasing the available gene pools of these crops, with unquestionable future adverse affects. Where yield increase success has occurred, it has been facilitated by increased inputs of high-cost irrigation water and fertilizers. These uneconomic applications to relatively low value crops have resulted from government subsidies to these sectors, removing them from marketplace discipline. They are essentially internal transfer payments adding to national debt load and constitute little or no overall increase in national production. It is felt that for political reasons, 2 critical problems will result from the Green Revolution illusion: (1) lessened government concentration in the agricultural sector and (2) avoidance of facing the most crucial problem of all -- overpopulation. ADVANCE PLANNING SUCCESS IN CHICAGO,
Chicago Dept. of Water and Sewers, Ill.
James W. Jardine, and Louis R. Howson.
Journal American Water Works Association, Vol 62, No 7, p 397-399, July 1970. 1 tab.

Descriptors: *Long term planning, *Future planning (Projected), *Estimated costs, Construction costs, Project planning, Estimating, Forecasting, Utilities, Water resources development, Cities, Water resources, Planning, Illinois.
Identifiers: *Chicago Water Works, Chicago.

Advance planning is important in determining a construction schedule which will expand and maintain water resources facilities to meet increasing demands at the lowest possible cost. The City of Chicago has predicted the expenditure of $370 million (1969 price level) for new construction over the thirty year period 1969 - 2000. The magnitude of this figure justifies the careful survey of past, present, and future water requirements. Future water requirements, will reflect the growth of population in Chicago and a slight increase in per capita consumption. Long range planning must then be based on these factors and must also include a determination of areas in which water requirements will increase most. Very great savings have been accomplished through waste control in the system, and on the premises of the consumers. Waste control has decreased the amount of water lost to such an extent that the pumping requirements to the system have not increased significantly in spite of substantial ppulation growth. The average yearly expenditure for renewal and replacement of equipment over the next 30 years is estimated at $7.7 million, or 1.5% of the total investment in the Chicago Water Works. Currently the average family pays $37.50 per year for water, while metered customers pay $.275 per thousand gallons. (Hewett-Rutgers)

PRIVATE GOOD, EXTERNALITY, PUBLIC GOOD,
Glasgow Univ. (Scotland).
Alan W. Evans.
Scottish Journal of Political Economy, Vol XVII, No 1, p 79-89, February 1970.

Descriptors: *Welfare economics, Marginal utility demand curve, Flood control.
Identifiers: *Public good, *Externality, Pareto optimality, Social welfare function, Semi-public good, Private good, Consumption externality.

The purpose of this paper is to demonstrate that the welfare conditions for a public good are a special case of the welfare conditions for a consumption externality. A public good is defined (according to Samuelson in 1958) as a good which all enjoy in common so that each individual's consumption of such a good leads to no subtraction from any one else's consumption of that good. The welfare conditions for goods with external effects are derived. The optimality conditions for an ordinary externality are identical with the optimality conditions for a public good only when the good is consumed by only one person in the economy, the other consumers bearing the external effects. Since there is a distinction between public goods and goods with consumption externality, the terminology should be preserved for ease of classification. This article provides a general theoretical background for water studies concerned with the public-good aspects of water resource development. (Seigenthaler-Rutgers)

BENEFIT-COST ANALYSIS AND DEMAND CURVES FOR PUBLIC GOODS,
Princeton Univ., N.J.
David F. Bradford.
Kyklos, Vol XXIII, Fasc 4, p 775-790, 1970.

Descriptors: *Demand, *Optimization, *Social aspects, Economic evaluation, Economic efficiency, Cost-benefit analysis, Decision-making, Spillovers, Marginal cost, Production, Government, Welfare economics.
Identifiers: *Public goods, *Aggregate bid curve, Pareto optimality, Externalities, Individual preferences.

This study is concerned with the problem of ascertaining the demand curve for public water resource investments. The author suggests the use of total quantities rather than averages in the analysis of public goods. He discusses the use of a demand curve construction, which he calls an aggregate bid curve. This is a device which builds upon the intuitive notion of bargaining to reach a collective decision. It has the advantage of making the potential gains from trade evident in movements towards a Pareto optimal level of public goods provision. It also clearly distinguishes the concept of a benefit in benefit-cost analysis. The author demonstrates that all of the conditions of efficiency, even in the presence of public goods and externalities can be derived with this formulation of the demand function. (Murphy-Rutgers)

DILEMMAS OF ECONOMIC BEHAVIOR VIS-A-VIS ENVIRONMENTAL POLLUTION,
Vienna Univ. (Austria).
Robert Reichardt.
Kyklos, Vol XXIII, No 4, p 849-865, 1970.

Descriptors: *Environmental pollution, Cutical path method, Cost, Risk.
Identifiers: *Public consumption good, Ecosystem, Time-preference, Income redistribution, Game theory, Payoff.

This article considers the reasons for the delays in improving the human environment. The author discussed the following topics: the measurement of environmental quality, its symbolic appeal, the structure of possible actions and conflicting economic motivations with respect to the environment. The measurement of environmental quality, a public consumption good, is difficult because of differences in perception, adaptation, and time preference. The Critical Path Method, a management technique, is applied to an example of a lake threatened by water pollution in order to demonstrate the necessary actions to solve the problem. Conflicting economic motivations toward environmental pollution are analyzed through economic roles or vested interests and attitudes toward environmental change. Among the roles discussed are that of the polluting consumer, the polluting producer, the anti-pollution device producer, and the government. There are conflicts between and within the roles as well as time preference differences. There is a bargaining process where each role-holder tries to maximize his own utility with respect to antipollution legislation and imposes social costs on other agents. Game theory and public expenditure theory are used in the analysis of conflict. A necessary condition for cooperative action is that some agents be involved in altruistic behavior. (Siegenthaler-Rutgers)

THE GENERAL RELATION OF TECHNOLOGIC CHANGE TO EFFICIENCY IN WATER DEVELOPMENT AND WATER MANAGEMENT,
Carnegie Institution of Washington, D.C.
Edward A. Ackerman.
In: Readings in Resource Management and Conservation, Chicago, University of Chicago Press, p 450-467, 1965.

Descriptors: *Technology, *Water resource development, *Water supply, Management, Water demand, Economic feasibility, Planning, Multiple-purpose projects, Operations-research, Meteorology, Economic evaluation, Water quality, Chemical wastes, Aquifers, Conservations, Evaporation, Desalination.
Identifiers: Nuclear explosives.

This report examines the means which may be made available for increasing the efficiency of water supply use for whatever specific objectives which may be chosen by Congress. The author presents those aspects of new technology related to future water resource development. The different alternatives are evaluated in terms of their applicability to specific purposes and regions, the economic feasibility in relation to the water supply and water savings, and the present state of development. The techniques discussed are those relating to the planning, design, construction and operation of systems of multiple-purpose works; the exploration for, discovery and exploitation of new supplies; the measures for conservation and reduction of demand, and the treatment and use of waters having substandard quality. (Murphy-Rutgers)

REGIONAL PLANNING AND FLOOD PLAIN MANAGEMENT,
Pennsylvania State Planning Board, Harrisburg.
Irving Hand.
In: Proceedings of the Fourth American Water Resources Conference, New York, p 241-254, November 18-22, 1968.

Descriptors: *Flood plains, *Management, *Flood control, Non-structural alternatives, Flood plain zoning, Flood damage, Costs, Regional analysis, Planning, Government, Land use, Government.
Identifiers: *Flood plain management, *Pennsylvania Act 442, Subdivision, Building codes.

The author examines the developments relating to the need for concern with flood plain management and the various agencies which have been involved in dealing with these issues. The continuing presence of large flood damage costs emphasizes the need for controling development in flood plain areas. This should be the function of the regional planning agency. The author considers such possible non-structural measures available to implement plans for flood plain management as zoning, subdivision regulation, building and construction codes and the reservation of certain areas for future public acquisition. These are evaluated in terms of their feasibility and effectiveness. (Murphy-Rutgers)

REGULATION AND THE FREE MARKET: THE PROBLEM OF BOUNDARIES,
Vanderbilt Univ., Nashville, Tenn. Dept. of Economics.
James W. McKie.
The Bell Journal of Economics and Management Science Vol 1, No 1, p 6-26, Spring 1970.

Descriptors: *Public utilities, *Prices, *Costs, *Welfare economics, Optimization, Rate of return, Marginal cost, Competition, Resource allocation, Economic evaluation, Regulation, Government, Value, Economic efficiency, Spillover, Capital cost, Management.
Identifiers: Electric utilities, Rate discrimination, Value of Service, Boundaries.

This paper deals with the problem of utility pricing and external limits to the regulated activities of public utilities in a competitive environment. The problem of correct pricing procedures and limits on the growth of water utilities may be clarified by this article. The author shows that as long as a utility is relatively isolated and self-contained its pricing problems are relatively simple and the system is satisfactory from the point of view of economic welfare as long as it fulfills the marginal conditions. However, a boundary problem appears whenever regulated activities are intermingled with non-regulated ones or when public utilities compete with each other or with unregulated industries, or where technological innovation and new forms of organization lead to new kinds of activities for the public utility. The paper demonstrates that this may distort the attainable degrees of discrimination, customer classifications, the internal structure of profit margins, the stability of prices, and the rate of return and lead to the condition of pricing below marginal cost. (Murphy-Rutgers)

RECREATION DEMAND FUNCTIONS AND THE IDENTIFICATION PROBLEM,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Economics.
Robert J. Kalter, and Lois E. Gosse.
Journal of Leisure Research, Vol 2, No 1, p 43-53, Winter 1970.

Descriptors: *Recreation demand, *Decision making, Time series analysis, Cross section, Forecasting, Resource allocation, Economic efficiency, Cost-benefit analysis, Elasticity of demand.
Identifiers: **Identification problem, *Structural demand, Reduced form equation, User response model, Econometrics, Equity, Consumer surplus.

This paper considers the identification problem of demand equations in the study of outdoor recreation. Improper accounting of demand and supply can lead to projections of supply imbalances. One approach to this problem is to use reduced form equations and user response models. These models assume that the effect on use of a given increase in facilities is constant regardless of the magnitude
location of such an increase. These models do n
yield a true recreation demand estimate and resu
in another identification problem. The identific
tion problem has been linked to the use of time s
ries data and reliance on site-oriented recreati
demand studies. The authors stress the importan
of the structural demand equation approach for o
taining estimates of the economic value of recre
tion for use in public decision-making. A soluti
to the identification problem is presented with t
suggestion that individual cross section data
used to estimate a traditional market type
recreation demand equation rather than a si
specific function. The cost of the entire recre
tional experience should be used as the price var
ble. The authors claim that the special nature
costs associated with participation in outdo
recreational activities and the spatial distribution
recreation facilities make this model feasible. T
article is relevant to studies concerned with estim
tion water-oriented recreation dema

matrix, Output multiplier, Payment sector, Dir
coefficient, Indirect coefficient, Exogenous.

This thesis examines the economic interrelati
ships of Colorado's economy using input-outp
analysis. This study builds a provisional input-o
put model of Colorado for the year 1967 wh
describes the intra- and-intersectoral flow of goo
and services in Colorado's economy. For the ana
sis, the economy of Colorado was divided into
teen processing or producing sectors and one
ogenous sector. Sectors were chosen on the basis
available secondary data and the importance
water to the sector. An aggregated 1963 Uni
States transactions table for these sectors w

developed. Given this table, the United States direct coefficients were determined as well as the indirect coefficients and output multipliers. It was assumed that Colorado's technical or direct coefficients correspond identically to those of the United States. Given this assumption, it was possible to derive a transactions table for Colorado. However, because of the lack of primary data available for Colorado, the author concluded that the transaction table was not entirely reliable but magnitude references of an ordinal nature are possible. The author believes this study will prove useful in the determination of a more refined input-output analysis for Colorado. (Siegenthaler-Rutgers)

A SUMMARY ANALYSIS OF NINETEEN TESTS OF PROPOSED EVALUATION PROCEDURES ON SELECTED WATER AND LAND RESOURCE PROJECTS.
Water Resources Council, Washington, D.C.

Report to the Water Resources Council by the Special Task Force, July 1970. 226 p, 7 tab, 4 chart.

Descriptors: *Water resources development, Water management, Planning.
Identifiers: *Water resources planning, Comprehensive planning.

The Report to the Water Resources Council by the Special Task Force includes a summary analysis of 19 tests of proposed evaluation procedures on selected water and land resource projects. The tests pointed up many areas in the report of June 1969, where ambiguities existed and further clarification was required. Further, the test results substantiated that the June report was concerned primarily with concepts and included only a few standards and procedures to implement them. Much of the testing effort was directed toward the development of standards and procedures to implement the concepts. In several tests, the teams explored alternative concepts departing from those presented in the June report. The tests have indicated that multiobjective planning is practical. Emphasis is placed on (1) measurement of plan impacts in terms of benefits and costs; and (2) formulation of alternative plans emphasizing the several national objectives. (Wray-Chicago)

STANDARDS FOR PLANNING WATER AND LAND RESOURCES.
Water Resources Council, Washington, D.C.

A Report to the Water Resources Council by the Special Task Force, Washington, D.C., July 1970. 299 p, 1 fig, 8 tab, 2 charts, 3 maps, 1 append.

Descriptors: *Water resources, *Land Resources, *Planning, *Standards, Methodology, Benefits, Costs, Evaluation, Formulation, Coordination, Cost allocation, Cost sharing.
Identifiers: *Water resources planning, Objectives, System of accounts.

These standards for water and land resource planning are a portion of a Water Resources Council study which proposes a set of principles, standards, and procedures for water and land resource planning. The principles provide the broad policy framework for planning activities and include the conceptual or theoretical basis for planning. The standards provide uniformity and consistency by comparing, measuring and judging benefits, costs, and alternatives. The procedures provide the methods for carrying out the various levels of planning activities, including the selection of objectives, measurement of benefits and costs, and comparison of alternate courses of action. The following topics are considered in the Standards: objectives; benefits and costs; general evaluation standards; plan formulation; a system of accounts; cost allocation, reimbursement, and cost sharing; a national program for Federal and Federally assisted activities; and the coordination and review of planning studies. (See also W71-02666) (Davis-Chicago)
W71-02665

PRINCIPLES FOR PLANNING WATER AND LAND RESOURCES.
Water Resources Council, Washington, D.C.

Report to the Water Resources Council by the Special Task Force, July 1970. 25 p.

Descriptors: *Water resources development, Water policy, *Planning, Decision-making.
Identifiers: *Water resources planning, Comprehensive planning.

The principles for planning water and land resources, together with Standards and Procedures, provide the basis for Federal participation with states and others in Federal and Federally assisted water and land resource projects. Multiobjective planning is stressed to improve the public decision-making process. The four main planning objectives are: (a) national economic development, (b) enhancement of quality of environment, (c) social well-being, (d) regional development. Benefits and costs are considered as they affect the objectives; benefits are positive contributions toward accomplishment and costs are negative. General Evaluation Principles include measurement of benefits and costs, price relationships, consideration of alternatives, scheduling, risk and uncertainty, and updating plans. Planning for water and land resources should be carefully related to other regional planning. Alternative plans of tradeoffs among significant conflicting objectives. A plan will be selected only if the total benefits (monetary and nonmonetary) to all objectives are equal to or exceed the total costs to all objectives. A system of accounts will be established that displays benefits and costs of each plan to the multiobjectives. Reimbursement and cost-sharing policies shall be directed to the end that identifiable beneficiaries bear an equitable share of costs commensurate with benefits received. THE SALT RIVER PROJECT OF ARIZONA: ITS ORGANIZATION AND INTEGRATION WITH THE COMMUNITY,
Arizona Univ., Tuscon.
Courtland L. Smith.
Master's Thesis University of Arizona, 1968. 298 p, 12 fig, 18 tab. OWRR B-003-ARIZ (2).

Descriptors: *Urbanization, *Electric power, *Water users, *Decision making, *Social aspects, *Economics, *Legal aspects, Technology, Arizona.
Identifiers: *Salt River Project, National Irrigation Act of 1902.

The Salt River Project is studied in terms of its adaption to rapid urbanization. Discussed here are laws and conventions embodied in the reclamation principle, which provides for the allocation of power revenues to reduce the cost of water to land owners. Charges to water users have decreased in the past thirty years with increased numbers of electric customers, increased electric customer usage and improved efficiency of the power system. Changes which have occurred in the transfer of water from farm to urban uses are enumerated. The project, it is indicated, has tended to accept the requirements of water users while adjusting its technical, economic, legal and social ability in order to continue the distribution of an adequate supply of low cost water. With population increases since World War II, the project has developed programs to educate the public about its activities and objectives; but it is still faced with the decision as to what role the urban public is to take in the decision making practice. A linked set of hypotheses has been developed to explain the project's adaption to urbanization. From this set, the effect of different degrees of disorganization, secularization and individualization can be assessed in relation to the change in the distribution of water with respect to position and the change in position in a social organization with increased numbers of participants. Methods for this study derive from the suggestions of Redfield in The Little Community and the systems concept. Social system components, elements external to the system, and data necessary to describe a social system are discussed. (Preckwinkle-Chicago)

Descriptors: *Recreation, *Time, *Income, Planning, Urbanization, Seasonal, Environment.
Identifiers: *Leisure, *Anticipation, *Travel, *Recollection, *Psychic environment, Space.

The author contends that the real wealth of a nation is the time of its members: very few studies have been made of it. Leisure, defined here as discretionary time above that needed for the basic subsistence requirements of man, is distinguished from mere idleness in which an individual does not know or is unable to do anything he wishes. Further distinction is seen between leisure and recreation; while leisure is basically a time oriented concept, recreation is a personal experience concept or activity. Similarities are observed between leisure and discretionary income; total amount of leisure, timing and size of its pieces, and its uses are noted as depending largely upon the phase of the individual life cycle. Included is a national time budget and time-division of leisure for 1900, 1950, and projected for 2000. Four major kinds of leisure are evident: Daily, Weekend, Annual, and retirement. With increases in leisure time expected, it is important to consider how each kind will be allotted. Discussion of outdoor recreation as a use of leisure involves a threefold, classification: user-oriented areas, close to where people live, intermediate use areas, designed primarily for day long recreation, and resource based areas more suited to vacation time. Five distinct phases of the recreation experience are outlined and discussed: anticipation, travel to the site, on-site experiences, travel back, and recollection. Discussed also are aspects such as seasonality, space-peaking, impacts on natural environment, and impact on the psychic environment e.g., privacy or solitude. Possible consequences of more leisure are discussed: greater emphasis on consumption and availability of time, and a greater urban dominated society with more urban leisure are considered. TECHNOLOGY, RESOURCES AND URBANISM--THE LONG VIEW,
Michigan Univ., Ann Arbor. School of Natural Resources.
Richard L. Meier.
In: Future Environments of North America, ed Darling, Fraser F. and Milton, John P., The Natural History Press, Garden City, New York, 1966, p 277-288. 16 ref.

Descriptors: *Resource development, *Communication, *Information retrieval, *Technology, *Research facilities, Population, Conservation.
Identifiers: *North America, South Asia, Houseboats.

The author asserts that a new set of insights will reconstruct the outlook for natural resources from nature-centered adaptive policies to urban interests. According to this new view, technology is a means for applying communicable knowledge to the environment (physical, biological, social) so as to produce valuable goods and services. As

knowledge continues to accumulate, the control over unwanted changes in the natural environment will increase. In the United States, it is indicated, no resource scarcity is critical enough to threaten development of the economy during the twentieth century. And by implication, no habitat is in danger due to crises of scarcity. Communicable knowledge enables forecasting to utilize expanding scientific studies and potentiality for substitutes for critical commodities. Materials and energy resources are reviewed for the various regions of North America. And attention is devoted to problems of water and land scarcity. One suggestion is that houseboats may reduce population density; optimism is also given for meteorological advances. Demands for living space while not critical in North America are in South Asia and the author indicates that this could seriously effect North American urbanization. It is contended that cities provide the best locus for human resources development. Cities that develop and grow, generating wealth and attracting the energetic individuals, are built and organized so that human capital is conserved and expanded. It is in the cities that one finds the best storage of information. Research, by piling up evidence and translating it into technological practices, has proven to be the most effective means for obtaining returns from resources. (Preckwinkle-Chicago)

RATE MAKING POLICIES AND PRACTICES OF PUBLICLY OWNED WATER UTILITIES,
Florida Univ., Gainesville. Dept. of Economics.
Norman G. Keig, Charles W. Fristoe, and Frederick O. Goddard.
Journal American Water Works Association, Vol 62, No 7, p 425-430, July 1970. 11 tab.

Descriptors: *Water rates, Public utilities, Water costs, Pricing, Cost analysis, Cost allocation, Cost sharing, Costs, Depreciation, Utilities.
Identifiers: *Rate making, Rate schedules, Cost classification.

This article describes various rate making policies and practices of selected publicly owned water utilities, and discusses the degree to which accepted rate making policies are followed. Two widely used bases for determining revenues which are discussed are the 'utility' basis and the 'cash' basis. Various practices which are examined are: the depreciation of facilities, the use of current funds for minor improvements, the use of reserve funds for major improvements, payment of local taxes, contribution to general municipal funds, free public water service, and free fire protection service. The classification of costs on either a demand basis or a functional cost basis, and the classification of customers into special groups are discussed. Four bases for rate schedules are presented and preferences for each type are discussed in relation to the questionnaire data. It was concluded that utilities practice and advocate the collection of sufficient revenue to be self-supporting. Most utilities pay for minor improvements from current funds and depreciate their facilities. A majority of the utilities use the cash method for determining revenues, but a significant number favor the utility method. The creation of reserve funds for major improvements is not often practiced, but is widely advocated. The functional method for classifying costs is more widely practiced than advocated. THE WELFARE EFFECTS OF ZERO PRICING ON PUBLIC GOODS,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Economics.
Joseph J. Seneca.
Public Choice, Vol VIII, No 2, p 101-110, Spring 1970.

Descriptors: *Social welfare, Marginal cost, Elasticity, Costs.
Identifiers: *Public good, *Zero pricing, Capacity constraint, Excess demand, Consumer surplus.

Certain public goods such as outdoor recreation have a zero user price because of equity considerations and pricing difficulties. Moreover, these goods are characterized by capacity constraints with the result of excess demand which leads to the rationing of available output. This paper considers the social welfare implications of the capacity constraints and non-price rationing of the public goods. It is shown that if a good is actually priced at long run marginal cost or zero, and there is excess demand, the welfare measures of the discriminating monopolist approach or short run marginal cost pricing overstate the true welfare measure at capacity. If short run marginal cost rises before capacity is reached with zero prices, then situations can exist where welfare can be increased by allowing full capacity utilization even though a quantity restriction based on a shadow short run marginal cost pricing policy would indicate otherwise. This discussion is relevant for water resource planners concerned with congestion and pricing problems. (Siegenthaler-Rutgers)

A MATHEMATICAL FORMULATION OF THE PEAK-LOAD PRICING PROBLEM,
Polytechnic Inst. of Brooklyn, N.Y.
Israel Pressman.
Bell Journal of Economics and Management Science, Vol 1, No 2, p 304-326, Autumn 1970.

Descriptors: *Optimization, Net benefits, Discriminatory pricing, Elasticity of demand.
Identifiers: *Peak-load pricing, Consumer surplus, Producer surplus, Dependent demand, Line integration, Capacity constraint, Profit constraint, Lagrangian multiplier, Marginal capacity cost, Marginal operating cost.

This paper develops mathematical models useful in analyzing the public utility peak-load pricing problem. The objective of the firm is to maximize social satisfaction from services provided. Mathematically, the firm's objective is expressed by maximizing the net benefit (i.e., the consumer surplus plus the producer surplus). The consumer surplus concept is extended to multidimensions to allow for periods where demand functions are both independent and dependent by using the line integral calculus. Demand is said to be dependent when price depends on the quantities of more than one service. The actual objective in the models is to maximize net benefit in a multi-period framework where demands are different for every period and subject to profit and capacity constraints. Peak-load pricing models with profit constraint show that prices depend on marginal operating costs but not on marginal capacity costs. With active profit constraints, price is dependent on the demand elasticities for independent demand but for dependent demand the cross elasticity is relevant also. For capacity constraint models, prices are charged according to marginal cost pricing principles. For both profit and capacity constraint models, prices depend on the marginal cost and demand elasticity. The article is important for water studies concerned with the theoretical foundations of pricing policies. (Siegenthaler-Rutgers)

A NOTE ON COST-BENEFIT ANALYSIS OF INVESTMENTS IN INTERMEDIATE PRODUCTS,
Stockholm Univ. (Sweden).
Leif Magnusson.
Swedish Journal of Economics, Vol 72, No 3, p 215-218, September 1970.

Descriptors: *Cost-benefit analysis, Marginal cost, Economic efficiency, Investment, Equilibrium.
Identifiers: *Intermediate product, Consumer surplus, Producer surplus, Capital good.

The author considers the application of cost-benefit analysis to investments in intermediate products. Intermediate products are capital goods which are used in the production of goods for final consumption. The consumers' willingness to pay for the consumer product can be measured by the area under the compensated demand curve for the capital product in question. However, if price variations occur in consumer product markets, corrections of the investment criterion must be made on the basis of an estimate of the resulting consumers' and producers' gains and losses on the consumer good market. An example of an investment in an irrigation project is given with the maximum willingness to pay for the project measured by the value of the increased supply of irrigation water at ex-post price and consumers' and producers' surplus on the consumer good market under the conditions that all prices are relatively constant and equal to marginal cost. More generally, it is found that an estimate from the market for the intermediate product will, under the above conditions, lead to a correct estimate of the willingness to pay. This article is of interest to water resource planners concerned with the evaluation of prospective projects. (Siegenthaler-Rutgers)

SOME PROBLEMS OF PRICING UNDER STOCHASTIC SUPPLY CONDITIONS: THE CASE OF SEASONAL PRICING FOR WATER SUPPLY,
London Graduate School of Business Studies, London (England).
M. A. Crew, and G. Roberts.
Water Resources Research, Vol 6, No 5, p 1272-1276, October 1970.

Descriptors: *Stochastic processes, *Water supply, Risk, Probability, Constraint.
Identifiers: *Seasonal pricing, Consumer surplus, Social welfare function, Opportunity cost, Lagrangian analysis.

This paper considers some of the problems of seasonal pricing of the water supply with particular attention to the determination of optimal seasonal carryover in a fixed capacity system and optimal pricing in the face of stochastic supply. First, a simple supply model is given which yields optimal prices, carryover and capacity. This model has little direct application except when the variance in runoff is small due to the stochastic nature of water supply. Secondly, a stochastic model with stochastic supply and determinate demand is given with each year treated independently. For the summer period, welfare gain is maximized subject to maintenance of a certain security level of water in the reservoir. In practice, pricing is more complicated for the start of the winter because the impact on the following summer must be considered. Since the amount of security which is provided is determined by value judgment, the stochastic model in practice is complex since it is influenced by social choice. (Siegenthaler-Rutgers)

GOVERNMENTAL ADMINISTRATION OF WATER RESOURCES IN THE CHICAGO METROPOLITAN AREA.
Northeastern Illinois Metropolitan Area Planning Commission, Chicago.

Public Administration Service, Chicago, Ill., 1963. 92 p, 9 map, 8 tab, 5 append.

Descriptors: *Planning, *Water resources development, *Administration, *Coordination control, Financing, Water supply, Sewage disposal, Flood control, Drainage, Multiple-purpose projects, Federal government, State governments, Interstate, Cities, Legislation.
Identifiers: *Water resources management, Water resources research, Counties, Special districts.

Management of water resources in the Chicago metropolitan area is studied with emphasis on problems of coordination and cooperation among governmental jurisdictions. The work is intended to serve as guide and precedent for similar action in other urban complexes. At the same time water resources management in other states and metropolitan areas is reviewed in order to gain some insight into how this area's problems can be solved. The area is first described in terms of its population growth past and present, its number and types of local governments, and those state and federal agencies concerned with water resources. Next, water resource facilities are described and mapped with present or anticipated problems outlined. Discussed are water supply systems, sewerage systems, flood control and drainage and other water uses and facilities including multipurpose facilities. Planning research, development, and financing are discussed from all levels from federal activity to municipal activity with interstate activity and special districts included. Federal influence and State, County, and Municipal controls are described and water management operations reviewed. In order for management to be effective, coordination among all levels is necessary with consideration of the overall water resources picture. Present sources of policy determination, judgement of operational effectiveness and need for comprehensive reporting are pointed out. Recommendations are made regarding implementation needs, intergovernmental cooperation, planning and financing, and legislative action. All levels of government are included with discussion regarding those levels needing strengthening. (Preckwinkle-Chicago)

SHERIFF V CITY OF EASLEY (RIGHT TO FLOW OF UNCONTAMINATED STREAM THROUGH PRIVATE PROPERTY).

183 SW 311-318 (SC 1936).

Descriptors: *South Carolina, *Pollutants, *Condemnation, *Sewage treatment, Eminent domain, Treatment, Natural flow, Sewage, Damages, Real property, Land, Cities, Streams, Reasonable use, Land use, Pastures, Farms, Compensation, Effluents, Water pollution, Natural use, Sewage disposal, Sewage effluents, Legal aspects, Judicial decisions, Municipal wastes.

Plaintiff landowner brought action against defendant city for permanent damages to her real property. Defendant had discharged pollutants and sewage into a stream which ran through plaintiff's land. Plaintiff maintained that she was entitled to the uninhibited, pure, and natural flow of the stream which ran through her land. Plaintiff contended further that defendant had made an unreasonable use of the stream and had deprived her of the ordinary use of her land for farming, pasturage, and as a residential site. Plaintiff concluded such use by defendant had amounted to the taking of her property without compensation. Defendant city contended that the sewage in the stream had been treated adequately and that the effluent did not cause any injury or damages to plaintiff's land. The court found that defendant had polluted the stream, thereby depriving plaintiff of the ordinary and reasonable use of her property. The court stated that such action by defendant had amounted to the condemnation of plaintiff's land. Therefore, the court held defendant had a duty to make just compensation to plaintiff for the property so taken. (Finman-Florida)

OGUNQUIT BEACH DIST V PERKINS (LOW WATER MARK AS BOUNDARY OF PROPERTY ADJACENT TO THE OCEAN).
21 A2d 660-664 (Me 1941).

Descriptors: *Maine, *Boundary disputes, *Low water mark, *Caosts, Oceans, High water mark, Atlantic Ocean, Littoral, Boundaries (Property), Legal aspects, Shores, Judicial decisions, Relative rights, Real property.

Plaintiff brought action to recover a parcel of land claimed by defendant. The controversy centered around the location of the dividing line between plaintiff's and defendant's property. Plaintiff contended that properties in dispute, being adjacent to the Atlantic Ocean, were to be measured by considering the properties' eastern boundary as the low water mark of the ocean. Defendant contended that the properties' eastern boundary was the high water mark of the ocean. The court held that when the deed of property adjacent to the ocean designates a boundary as 'the see' or 'the ocean', then the boundary extends to the low water mark. Since plaintiff's deed contained such a designation, the trial court's judgment for defendant was reversed. (Snow-Florida)
W71-02274

APPLICATION OF GILLESPIE (COMPENSATION FOR DAMAGE CAUSED BY INCREASE IN VOLUME OF FLOW).
265 App Div 239, 38 NYS 2d 612-616 (App Div 1942).

Descriptors: *New York, *Eminent domain, *Compensation, *Flow augmentation, municipal water, Judicial decisions, Legal aspects, Condemnation value, Easements, Cities, Flow control, Railroads, Embankments, Water distribution (Applied), Engineering structures, Civil engineering, Industrial water, Aqueducts, Reservoirs, Damages, Channel erosion.

Pursuant to the acquisition of a right to increase the flow of a creek abutting respondent railroad's property, petitioners, members of the Board of Water Supply, conveyed reservoir water into the creek. The addition of such reservoir waters eroded the natural banks of the creek and respondent's railroad embankments. Respondent appealed the report of the Commissioners of Appraisal which fixed only a nominal award for damages to the railroad embankments. Petitioners contended the awards should be nominal because the necessary reinforcement of respondent's embankments against normal stream flow would take care of the insignificant damage caused by the induction of reservoir water into the creek. The court, in granting respondent's motion to set aside the Commissioners' report, held that the award for damages was not just compensation. The court reasoned that petitioners must bear the portion of such burden caused by the increase in volume of flow and that awards of nominal damages did not meet such requirement. (Powell-Florida)
W71-02295

CHELTENHAM AND ABINGTON SEWERAGE CO V PUBLIC SERVICE COMM'N (OWNERSHIP OF STORM DRAINAGE SYSTEM).
311 Pa 175, 166 A 649-652 (1933).

Descriptors: *Pennsylvania, *Storm drains, *Surface runoff, *Use rates, Natural streams, Storm runoff, Urbanization, Drainage systems, Sewers, Clay pipes, Tiles, Streams, Marshes, Administrative decisions, State governments, Rates, Judicial decisions, Legal aspects, Regulation, Supervisory control (Power).

Plaintiff sewerage company appealed an order of defendant Public Service Commission which denied plaintiff's request for permission to charge for storm drainage service. Plaintiff's predecessor had installed conduits in streambeds to form a storm drainage system for a subdivision. A sewerage system was also installed by plaintiff's predecessor, separately and disconnected from the storm drainage system. Defendant contended that plaintiff did not own the storm system. The court determined that a conveyance to plaintiff by the subdivision promoter included only the sewerage system, and that if the storm system had been included, charges could not be exacted for its use, since the storm system was merely a substitute for natural drains. Property owners have a right to use artificial conduits for drainage of surface waters formerly carried away by natural streams. Furthermore, the court noted that there was meager evidence of maintenance of the storm system or other indicia of ownership. The court held that plaintiff did not own the storm drainage system and consequently could not charge for its use. (Hart-Florida)
W71-02309

HARVEY REALTY CO V BOROUGH OF WALLINGFORD (RIPARIAN RIGHTS AND PROTECTION OF PUBLIC WATER SUPPLY).
150 A 60-64 (Conn 1930).

Descriptors: *Connecticut, *Riparian rights, *Water supply, *Water pollution, Watercourses (Legal), Water utilization, Water policy, Legal aspects, Judicial decisions, Condemnation, Ponds, Streams, Water quality, Public rights, Public health, Relative rights, Competing uses, Reasonable use, Usufructuary right, Damages, Administrative agencies, Reservoirs, Legislation, Water pollution control.

Plaintiff realty company sought damages and an injunction restraining defendant borough from interfering with plaintiff's sale of land, along with bathing privileges, in a pond used by defendant as a source of water supply. Defendant counterclaimed and sought to restrain plaintiff from rendering such

water unfit for supply purposes. The trial court found the pond to be a reservoir within the meaning of a statute which prohibited bathing in and polluting reservoirs. The Supreme Court of Errors of Connecticut affirmed the trial court's judgment for defendant. Plaintiff had reserved land bordering the pond for use as a public park. Plaintiff's grantees were not riparian owners and consequently were not entitled to bathing privileges. Plaintiff's grant of public and private bathing privileges would have constituted an unreasonable use of the water. Riparian owners are limited to reasonable use of waters with due regard to the rights and necessities of other riparian proprietors. Riparian rights can only be claimed by a riparian owner, and an owner has no property in the water itself but a simple usufruct while such water passes along. The court's application of these general rules indicated that plaintiff's contemplated sales were extraordinary and unreasonable. (Duss-Florida)
W71-02314

CHICAGO MILL AND LUMBER CO V TULLY (TITLE TO ACCRETED LANDS).
130 F2d 268-276 (8th Cir 1942).

Descriptors: *Boundaries (Property), *Arkansas, *Accretion (Legal aspects), *Boundary disputes, Mississippi River, Rivers, Lumbering, Meanders, Islands, Bayous, Navigable waters, Drainage, Watersheds (Basins), Channels, Avulsion, Alteration of flow, Erosion, Maps, Riparian land, Water levels, Diversion.

Plaintiff lumber company brought suit to quiet title to certain lands allegedly accreted to other land owned by plaintiff. Defendant alleged that said lands were an accretion to lands in which defendant had legal title. The trial court appointed a master to determine the facts. The master found for defendant and the Court of Appeals, Eighth Circuit, affirmed. The court found that the land in question had been built up by accretion and not by avulsion. Whether such accreted lands were part of defendant's land or plaintiff's land was a question of fact for the master. The court found that there was no abuse of discretion in the master's finding. (Barnett-Florida)
W71-02315

NORTHERN IND POWER CO V CASTOR (ACQUISITION OF PRESCRIPTIVE RIGHT TO FLOOD LAND).
156 NE 571-574 (Ind 1927).

Descriptors: *Indiana, *Obstruction to flow, *Prescriptive rights, *Flood damage, Floods, Flooding, Backwater, Overflow, Dams, Levees, Rivers, Streamflow, Powerplants, Construction, Damages, Banks, Farms, Land tenure, Watercourses (Legal), Legal aspects, Judicial decisions.

Plaintiff farm owner sought to recover damages from defendant power company for the flooding of his land. Defendant had constructed a dam below plaintiff's land so that water backed up and flooded his property. Plaintiff alleged that construction of the dam was unlawful, was done without plaintiff's consent and was completed without a payment or tender of damages to him. Defendant contended that it had a prescriptive right to maintain the dam by virtue of the fact that there had previously been three dams in the same location, all of which had flooded plaintiff's land. Defendant admitted that flooding by the third dam had been reduced because of damages to it for some years prior to construction of the present dam. The jury returned a verdict for plaintiff, and the Appellate Court of Indiana affirmed. The court held that a prescriptive right to flood land is measured by the extent the right is exercised, in the instant case extending as far onto plaintiff's land as was habitually overflowed. Such a right and its exercise was properly a question for the jury. (Duss-Florida)
W71-02316

COLLINS V GERHARDT (OWNERSHIP OF BEDS OF NAVIGABLE RIVER SUBJECT TO RIGHTS OF NAVIGATION IN PUBLIC).
237 Mich 38, 211 NW 115-128 (1926).

Descriptors: *Michigan, *Navigation, *Ownership of beds, *Public rights, Navigable waters, Boundaries (Property), Riparian land, Riparian waters, Riparian rights, Damages, Judicial decisions, Legal aspects, Relative rights, Fishing, Patents, Grants, Beds under water, Land tenure.

Plaintiff owned land on either side of a river. He claimed that the part of the river which flowed through his land was his own and that he owned exclusive fishing rights therein. Plaintiff brought action in trespass against defendant for violating his alleged fishing rights. Defendant contended that the river was navigable, and therefore all rights of ownership in plaintiff were subject to the public's rights of fishing and navigation. The court applied the floatage test and declared the river to be navigable. An owner having title to land on either side of a navigable river owns the soil thereunder. However, the common law doctrine that the right of fishery follows the ownership of the beds was rejected by the court. Title to the beds is held subject to the rights in the public of navigation and fishery, whether held by the state or a private citizen. The trial court's judgment for plaintiff was reversed. (Price-Florida)
W71-02317

MORGAN V KLOSS (CONSTRUCTION OF BRIDGE TO ISLAND IN NAVIGABLE LAKE FOR PRIVATE PURPOSES).
244 Mich 192, 221 NW 113-114 (1928).

Descriptors: *Michigan, *Islands, *Navigable waters, *Bridge construction, Lakes, Bridges, Administrative agencies, Administrative decisions, State governments, Navigation, Depreciation, Riparian land, Legislation, Judicial decisions, Legal aspects, Regulation.

Plaintiff littoral landowners brought action to enjoin defendant from building a bridge from the lakeshore to an island. Plaintiffs contended that the bridge would be a nuisance, inhibit navigation, and depreciate their property values. Defendants had obtained permission from the board of county supervisors to erect the bridge. The court determined that the bridge would unquestionalbly hamper navigation. Furthermore, the court stated that authority to erect bridges over navigable waters for private purposes must be explicitly granted by the legislature. Finding no such authority to erect bridges over navigable lakes, the court held that the consent given by the county was ultra vires, and affirmed the lower court's decree enjoining construction of the bridge. (Hart-Florida)
W71-02318

FOX RIVER PAPER CO V RAILROAD COMM'N (ACQUISITION OF LICENSE FOR DAM OPERATION).
208 NW 266 (Wis 1926).

Descriptors: *Wisconsin, *Legislation, *Permits, *Dams, Navigable waters, Regulation, Cities, State governments, Railroads, Administrative agencies, Structures, Water works, Compensation, Eminent domain, Administrative decisions, Supervisory control (Power).

Plaintiff brought action to review an order of defendant Railroad Commission denying plaintiff a permit to operate an existing dam which was constructed without legislative authority. Defendant denied the permit on the ground that the provision of the statute requiring the applicant to consent to valuation and condemnation proceedings prescribed therein, in the event that the property be taken over by the state, was not included in plaintiff's application for a permit. Plaintiff alleged that the provision was unconstitutional and that defendant had no right to require such a consent as a condition precedent to its entertaining and considering the application. The Supreme Court of Wisconsin affirmed the lower court's holding that the law was constitutional (Barnett-Florida)
W71-02320

SOUTHERN RY V THACKER (LIABILITY FOR OBSTRUCTING PROPERTY'S NATURAL DRAINAGE).
179 SE 225-228 (Ga 1935).

Descriptors: *Georgia, *Obstruction to flow, *Ditches, *Drainage, Overflow, Watercourses (Legal), Damages, Land tenure, Embankments, Erosion, Flow, Ponds, Construction, Surface waters, Surface runoff, Surface drainage, Railroads, Washouts, Gullies, Legal aspects, Judicial decisions.

Defendant railroad had constructed an embankment which obstructed the natural drainage of plaintiff's property. It constructed a ditch to compensate for this but failed to keep it cleared out so that water backed onto plaintiff's property. Plaintiff sought to recover damages for such flooding. Defendant contended that the cause of action was based on its construction of the embankment and that it owed no duty to plaintiff regarding the embankment. The trial court found for plaintiff, and the Court of Appeals of Georgia affirmed. Defendant owed a duty to plaintiff to keep the ditch clear so that water would be drained off. The court held that it was clear that the action was based on defendant's failure to keep the ditch unobstructed. Plaintiff was only limited in her recovery to damages which occurred within four years of the filing of suit. (Duss-Florida)
W71-02321

HUMPHRIES V BLACK BETSEY CONSOL COAL CO (LIABILITY FOR FLOOD DAMAGES DUE TO DIVERSION OF STREAM).
178 SE 273-276 (W Va 1934).

Descriptors: *West Virginia, *Diversion, *Channels, *Flood damage, Watercourses (Legal), Floods, Beds, Roads, Road construction, Flow, Legal aspects, Judicial decisions, Adjudication procedure, Construction, Damages, Channeling, Channel flow, Flooding.

Plaintiff landowner sought to recover for flood damages from defendants coal company and county court. Plaintiff alleged that the damages resulted because defendants changed a normal creek channel so that it ran nearer to his property. This change was caused by defendants' construction of a road. Defendant coal company contended that it constructed the road under an agreement with the county court that the county would take over the road. It alleged the road did not constitute an imminent danger to plaintiff and that once such road was taken over by the county, its responsibility ended. The jury found against defendant coal company and for defendant county court, and the Supreme Court of Appeals of West Virginia affirmed. The court held that the agreement between the coal company and county court was unlawful and that the coal company could not escape liability for diverting the stream on the ground of an employer-independent contractor relationship. The court further held that defendant coal company could not escape liability because the county court took over the road before the damages occurred since the diversion caused the damages. One judge dissented. (Duss-Florida)
W71-02322

PORT UTIL COMM'N V MARINE OIL CO (LIABILITY FOR RENT WHERE WATER DEPTH NOT MAINTAINED).
175 SE 818-321 (SC 1934).

Descriptors: *South Carolina, *Leases, *Docks, *Water levels, Depth, Damages, Contracts, Legal aspects, Judicial decisions, Administrative agen-

cies, Relative rights, Adjudication procedure, Remedies, Rent.

Plaintiff utilities commission sought to eject defendant oil company from a wharf for nonpayment of rent. Plaintiff's and defendant's rental agreement called for a minimum depth in the wharf's slip at low tide. Defendant contended that this minimum depth was never maintained by plaintiff and that this breach amounted to a total eviction from a portion of the premises. Therefore, defendant contended that its liability for the rent was suspended. The Supreme Court of South Carolina, in affirming the lower court's decision for plaintiff, held that defendant's contention was not the rule in South Carolina. There can be no eviction unless a tenant actually possesses the premises from which he claims eviction. Defendant never possessed the depth of water. Secondly, defendant was in possession of the premises before the contract was signed. The clause concerning the depth was in the nature of a promised improvement, and plaintiff's failure to perform did not entitle defendant to refuse payment or vacate the premises. Defendant's remedy would have been an action for damages. (Duss-Florida)
W71-02323

COLLINS MFG CO V WICKWIRE SPENCER STEEL CO (UPPER RIPARIAN PROPRIETOR MAY NOT POLLUTE WATER TO THE INJURY OF LOWER RIPARIAN PROPRIETOR).
14 F2d 871-874 (D Mass 1926).

Descriptors: *Massachusetts, *Water pollution, *Pollution abatement, *Riparian rights, Damages, Remedies, Artificial use, Legal aspects, Judicial decisions, Industries, Water reuse, Industrial wastes, Relative rights, Recirculated water, Prior appropriation, Running waters, Streams, Industrial water.

Plaintiff corporation sought to restrain defendant corporation from polluting the waters of the river which flowed through the land of both parties. Plaintiff contended that defendant upper riparian proprietor could not use the waters of the river in such a way as to pollute it to the injury of plaintiff lower riparian proprietor. Defendant contended that plaintiff's claims were too general and did not entitle him to equitable relief. The court held that no riparian proprietor has the right to use the waters of a natural stream for such purposes as would materially corrupt it to the substantial injury of a lower proprietor. Although plaintiff's complaint was very broad, the court found that it warranted equitable relief. (Quesada-Florida)
W71-02324

DAVIS V GULF AND I RY OF TEXAS (SHALLOW AND CROOKED STREAM NOT NAVIGABLE WATERWAY).
31 F2d 109-110 (5th Cir 1929).

Descriptors: *Texas, *Navigable waters, *Navigation, *Bridges, Transportation, Running waters, Streams, Surface waters, Federal government, Remedies, Legislation, Judicial decisions, Legal aspects, Shallow water, Marshes, Barriers.

Plaintiff railroad company sought to enjoin the enforcement of a penalty against it by defendant Secretary of War. The penalty arose from a finding by defendant that plaintiff's bridge was obstructing the navigability of what defendant had determined to be a navigable stream. Plaintiff contended that the stream was merely a drain in a salt marsh, shallow and crooked, and therefore not navigable. Defendant contended the stream was navigable in fact and therefore he was authorized by federal law to penalize plaintiff for obstructing the stream's navigability. The United States Circuit Court of Appeals held that the test of navigability is whether a waterway in its natural state is capable of affording a highway for useful commerce. The court found that the stream was not navigable under this test and upheld an injunction. (Quesada-Florida)
W71-02325

OZARK PIPE LINE CORP V DECKER (LIABILITY FOR STREAM CONTAMINATION BY OIL).
32 F2d 66-69 (8th Cir 1929).

Descriptors: *Missouri, *Damages, *Pollutants, *Water pollution sources, Piping systems (Mechanical), Pipes, Pipelines, Hydraulic structures, Remedies, Legal aspects, Judicial decisions, Springs, Subsurface waters, Water sources, Oil, Oily water.

Plaintiff landowner brought an action for damages against defendant oil corporation based on an alleged oil leak from defendant's pipeline which ran through plaintiff's land. Plaintiff contended that the leakage had caused a spring on his property to become polluted. Defendant contended that there was no evidence from which it could be found that the condition of the spring was attributable to any act or neglect on its part. Defendant maintained that the oil in the spring water could have come from oil that had been in the ground for a number of years. The court held that in order to support a judgment for damages evidence must show more than a mere possibility of contamination from oil pipeline leakage. The trial court's judgment for plaintiff was reversed. (Quesada-Florida)
W71-02326

HODGES V TOWN OF BLUFF CITY (ACQUISITION OF WATER RIGHTS).
32 F2d 779-780 (6th Cir 1929).

Descriptors: *Tennessee, *Municipal water, *Water rights, *Water sources, Springs, Running waters, Spring waters, Legal aspects, Remedies, Judicial decisions, Beneficial use, Reasonable use, Relative rights, Consumptive use, Water demand, Water distribution (Applied), Water supply.

Plaintiff landowner sought to enjoin defendant city from taking water from a spring for municipal purposes. Plaintiff claimed the right to the waters from the spring under a quitclaim deed made out to his vendor and the vendor's sons. Plaintiff contended that his vendor was the grantee of the rights to the spring and therefore those rights had passed to him. Defendant contended that plaintiff had been conveyed only the interests of the vendor and not those of the two sons named in the quitclaim deed. Defendant maintained that it was the successor to the two sons' interest and thus it had a right to two-thirds of the spring water. The court held that one taking under a quitclaim deed conveying water rights to himself and two others was entitled to only a one-third interest in the water of the spring. (Quesada-Florida)
W71-02327

WABASH RR V LEWIS (LIABILITY FOR FLOODING CAUSED BY INSUFFICIENT DRAINAGE THROUGH RAILROAD EMBANKMENT).
48 F2d 519-523 (8th Cir 1931).

Descriptors: *Missouri, *Flooding, *Obstruction to flow, *Flood damage, Backwater, Drainage water, Damages, Floodwater, Floods, Overland flow, Rain, Rain water, Runoff, Storm runoff, Excessive precipitation, Drainage, Surface drainage, Surface waters, Flow, Judicial decisions, Railroads, Surface runoff, Drains, Embankments, Legal aspects.

In an action for damages, plaintiff contended that defendant railroad company had constructed a railroad bed embankment and had failed to provide a sufficient opening through such embankment for the drainage of surface waters. As a result, plaintiff contended drainage waters from a rainfall were obstructed in their natural flow and were caused to back up onto plaintiff's property, thereby flooding and damaging such property. Defendant contended that the rainfall was extraordinary and that its failure to provide drainage through its embankment was not a proximate cause of the flooding. The court stated that where rains are unprecedented, one obstructing flow will not be held liable if the unprecedented rainfall is the sole cause of damage. However, the court held that the evidence indicated that the rainfall was not extraordinary. The court thus ruled that defendant was liable for the damages resulting from its failure to provide for adequate drainage of surface waters. (Snow-Florida)
W71-02328

WILLARD V STONE (EASEMENT FOR WATER SUPPLY MEANS REASONABLE USE OF ALL WATER ON SERVIENT PROPERTY).
253 Mass 555, 149 NE 681-684 (1925).

Descriptors: *Massachusetts, *Springs, *Easements, *Water supply, Reservoirs, Contracts, Judicial decisions, Legal aspects, Remedies, Water sources, Reasonable use, Spring waters, Watercourses (Legal), Droughts, Low flow, Piping systems (Mechanical), Hydraulic structures, Supply contractors, Water contracts, Usufructuary right.

Plaintiff sued to enjoin defendant adjoining landowner from interfering with plaintiff's right to take water from springs on defendant's land. Plaintiff's grantor had obtained an easement to take the water from defendant's grantor and had installed on defendant's land pipes to spring A, a dam, a reservoir and hydraulic rams. Later, after an oral agreement, plaintiff's grantor installed pipes to spring B but did not make some other improvements that he and defendant had agreed to. Later, defendant constructed a second reservoir and connected spring B to it, and during a subsequent drought, the water in spring A was diminished. Defendant questioned whether plaintiff had a right to water from spring B because of the failure of his grantor to fulfil the oral agreement. Defendant also contended that plaintiff had abandoned his easement. The Supreme Judicial Court of Massachusetts, in affirming a decree for plaintiff, held that the original contract entitled plaintiff to use of all the water he reasonably needed from all the springs and the right to do what was necessary to obtain such water. Such right was not abandoned unless abandonment was clearly intended by the owner of the right. (Morris-Florida)
W71-02329

NORFOLK AND W RY V MCCOY (LIABILITY OF RAILROAD FOR RIVERFILL CAUSING OVERFLOW).
257 Ky 32, 77 SW2d 392-394 (1934).

Descriptors: *Alteration of flow, *Railroads, *Floods, *Kentucky, Overflow, Diversion, Obstruction to flow, Streamflow, Barriers, Piles (Foundations), Flow, River flow, Beds, Rivers, River beds, Judicial decisions, Damages.

In an action for damages to land, plaintiff contended that defendant railroad company was liable for overflow of a river onto plaintiff's land. Plaintiff maintained that such overflow was the result of a railroad fill in the river bed upstream from plaintiff's land. The fill allegedly diverted the river from its natural course onto plaintiff's property. Defendant contended that the fill was not the cause of the overflow, but that such overflow was the result of seasonal high waters. The court held that plaintiff had failed to introduce sufficient evidence to establish that the overflow was a result of the fill. Accordingly, plaintiff was denied recovery. (Snow-Florida)
W71-02330

HORTON V NIAGARA, LOCKPORT AND ONTARIO POWER CO (OWNER OF BANK OWNS TO THREAD OF CHANNEL).
231 App Div 386, 247 NYS 471-755 (1931).

Descriptors: *New York, *Boundaries (Property), *Islands, *Banks, Ownership of beds, Legal aspects, Judicial decisions, Remedies, High water mark, Real property, Watercourses (Legal), Water

level fluctuations, Streamflow, Riparian land, Riparian waters, Boundary disputes, Channels, River beds, Condemnation, Damages, Eminent domain, Hydroelectric plants.

Plaintiff, who claimed to own land on both sides of the Salmon River as well as an island in the middle of such river, sought an injunction to require removal of defendant hydroelectric company's power plant and transmission lines from the shores of the river. Defendant contended that plaintiff's predecessor in title had sold the shores to defendant's predecessor in title, the deed specifying 'the land between the brink of the two banks' of the river which flowed down a steep gorge. The court affirmed a referee's finding for defendant as to ownership of the shores on both sides of the river. The court found the deed intended to give defendant title to the top of the precipice on each side of the gorge rather than the mere high water mark of the river. As to ownership of the island, the court found a previous case was res judicata in plaintiff's favor. Since defendant could condemn the island, the court ordered defendant to pay for encroachment of its transmission lines on the island. The court found the power plant did not encroach in the island because it was on the mainland side of the thread of the stream, and defendant's title extended to such thread. (Morris-Florida)
W71-02331

KELLY V NAGLE (RIPARIAN RIGHT TO THE NATURAL FLOW OF A STREAM).
132 A 587-594 (Md 1926).

Descriptors: *Maryland, *Riparian rights, *Reasonable use, *Natural flow, Alteration of flow, Competing uses, Diversion, Relative rights, Riparian land, Riparian waters, Severance, Streamflow, Flow, Streams, Springs, Judicial decisions, Spring waters, Pipes, Easements, Land tenure, Water rights.

Plaintiff sought to enjoin defendant from plugging up a pipe which carried water from a spring on defendant's land to plaintiff's non-riparian land. Plaintiff contended that defendant's predecessor in title had granted her the right to acquire spring water through such a pipe. Defendant contended that the grant of such a right was invalid. The court held that the grant had been an invalid exercise of defendant's predecessor's riparian rights. The court stated that a riparian owner cannot divert the waters of a spring in excess of that which he may make a reasonable use of upon his own land. Any other diversion by a riparian would violate the rights of lower riparians to the spring's flow. Defendant's predecessors' grant of the water to a non-riparian was thus putting the water to a use not associated with the riparian's land and as such was an unreasonable use of the spring's water. The grant to plaintiff was therefore invalid, and the court held that plaintiff was not entitled to an injunction. (Snow-Florida)
W71-02332

ROTH V STATE (LIABILITY FOR DROWNING CAUSED BY DEEPENING THE WATERS ADJACENT TO A PUBLIC BEACH).
262 App Div 370, 29 NYS2d 442-444 (1941).

Descriptors: *New York, *Drowning, *Beaches, *Dredging, Recreation facilities, Lakes, Recreation, River basin development, Boating, Swimming, Beds, Beds under water, Lake beds, Basins, Judicial decisions, State governments, Depth, Deep water, Excavation.

Plaintiff, decedent's executor, brought a wrongful death action against the state of New York for negligence which allegedly led to the drowning of decedent. Plaintiff contended that defendant created an unreasonable risk to bathers when it deepened the waters adjacent to a public beach. Plaintiff contended further that, as a result of defendant's acts, decedent, while swimming, stepped into the deepened area and drowned. The court held that the beds of the lake was held in trust by defendant for the people of the state. The public thus had a right to use the waters of the lake for recreation and enjoyment. The court held that defendant, in deepening the waters adjacent to the beach and failing to warn the public of the risk, created an unreasonable risk and would be held liable for injuries resulting from such negligence. The trial court's judgment for defendant was reversed. (Snow-Florida)
W71-02333

TENNESSEE VALLEY AUTHORITY V ASHWANDER (TVA'S AUTHORITY TO SELL POWER IN EXCESS OF THAT PUT TO GOVERNMENTAL USE).
78 F2d 578-583 (5th Cir 1935).

Descriptors: *Dams, *Hydroelectric plants, *Tennessee Valley Authority Project, *Hydroelectric power, Electric power, Electric power production, Electricity, Rivers, Navigable rivers, Navigable waters, Federal government, Administrative agencies, Judicial decisions, Transmission (Electrical), Claims (Contracts), Contracts.

In an action to rescind a contract, plaintiff power company contended that a contract made with the Tennessee Valley Authority was invalid as being an ultra vires act by the Authority. Plaintiff contended that selling its power transmission lines to the Authority was invalid in that the lines were going to be used for an illegal proprietary operation--that the Authority was going to sell power, in excess of government requirements, to private parties. Plaintiff contended that such would be outside the government's authority under the commerce clause. Defendant contended that the selling of the excess power was consistent with its authority under the commerce clause to build dams on navigable rivers. The Circuit Court of Appeals, Fifth Circuit, held that defendant, by virtue of lawful ownership of the dam, owned all the water power created by the construction of the dam. Defendant could thus dispose of water power as freely as it could dispose of any other governmental property. The Authority could thus sell the power in excess of governmental requirements. Such was not an ultra vires act. Therefore, the contract for the transmission lines was valid. (Snow-Florida)

UNITED STATES EX REL GREATHOUSE V HURLEY (FEDERAL GOVERNMENT'S DISCRETIONARY POWER TO ISSUE WHARF PERMITS IN THE DISTRICT OF COLUMBIA).
63 F2d 137-147 (DC Cir 1933).

Descriptors: *Docks, *Ownership of beds, *Riparian rights, *District of Columbia, Navigable rivers, Beds, Beds under water, River beds, Riparian land, Navigable waters, Rivers, Rivers and Harbors Act, Virginia, Maryland, Relative rights, United States, Federal government, Judicial decisions, Federal jurisdiction, Permits, Navigation.

Plaintiffs sought a writ of mandamus to compel the Secretary of War to issue a permit for the construction of a wharf in the Potomac River. Plaintiffs contended that, under a 1785 compact between Maryland and Virginia, they had acquired such property rights to the bed of the Potomac River as to entitle them, as a matter of right, to a permit. Defendant contended that the compact was not applicable to property now within the District of Columbia. Instead, defendant contended, navigable waters were subject to the plenary regulatory power of Congress and the issuance of a permit by the Secretary of War was merely a discretionary act. The court held that the ceding of the District of Columbia by Virginia to the federal government terminated any privilege which Virginia had given to the riparian owners to make use of its bed. The control of the river and its bed is subject to the plenary power of Congress. As a result, the Secretary of War can issue permits for wharf construction at his discretion and mandamus will not lie for discretionary acts of this nature. (Snow-Florida)
W71-02335

SMITH V STASO MILLING CO (DOCTRINE O COMPARATIVE HARDSHIP NOT APPLICA BLE WHERE POLLUTER FOREWARNED O POLLUTION DANGER).
18 F2d 736-739 (2nd Cir 1927).

Descriptors: *Vermont, *Water pollution, *Indu trial wastes, *Pollution abatement, Relative right Sludge disposal, Wastes, Streams, Running wate Damages, Remedies, Legal aspects, Judicial dec sions, Water pollution sources, Riparian rights, A judication procedure.

Plaintiff lower riparian landowner sought to enjo defendant slate grinding corporation from pollu ing, with slate dust and sludge, a brook runni through his land. Plaintiff contended that defe dant had been warned by him before building i mill and that defendant had assured him it wou not defile the brook. Contending that defenda ignored the warnings and broke its promise, plai tiff sought to enjoin defendant's operation ad collect for blasting damages. Defendant contende that it had installed dust arresters and had done possible to prevent the pollution. The United Stat Circuit Court of Appeals held that, in light of t explicit warning given by plaintiff and defendan promise, the burden of successfully avoiding poll tion of the brook fell upon defendant. In conside ing the doctrine of balancing comparative har ships, the court found that plaintiff's forewarni and defendant's promise favored the issuance the injunction. (Quesada-Florida)

CENTRAL OF GEORGIA RY V FAULKNE (LIABILITY FOR CHANGE IN EXISTIN DRAINAGE PATTERN).
114 So 686-688 (Ala 1927).

Descriptors: *Alabama, *Surface drainage, *Ra roads, *Prescriptive rights, Alteration of flo Right-of-way, Transportation, Embankmen Highways, Roads, Judicial decisions, Legal aspec Damages, Surface waters, Natural flow, Drainag Surface runoff, Riddance (Legal aspects), Dive sion.

Plaintiff, who owned land fronting on defenda railway's right-of-way, sued for damages after d fendant widened the embankment on the right-o way. Plaintiff claimed the action destroyed a publ road which led to plaintiff's land and diverted su face waters onto plaintiff's property. Defenda contended the roadway was not a public roa because defendant had not received notice of hostile public claim that would lead to prescriptio and argued that a superior proprietor was under duty to maintain drains to prevent natural flo onto servient lands. The Supreme Court Alabama, reversing a decision for plaintiff, he that open, continuous, public use of a highway f 20 years creates a prescriptive right unless the la downer establishes that the use is permissive a not hostile. Such a prescriptive right may be o tained over a railroad's right-of-way. Also, if t embankment altered the existing drainage patter defendant would be liable for diverting surfa waters onto plaintiff's land. (Morris-Florida)
W71-02337

COVINGTON V CASSIDY BAYOU DRAINAG DIST (RIPARIAN OWNERS' RIGHT T THROUGH A DRAINAGE DISTRICT, PR TECT AGAINST FLOOD BY OBSTRUCTIO OF A WATERCOURSE).
122 So 205-216 (Miss 1929).

Descriptors: *Mississippi, *Bayous, *Drainage d tricts, *Dams, Judicial decisions, Legal aspec Remedies, Watercourses (Legal), Contrac Floods, Engineering structures, Rains, Excessi precipitation, Natural flow, Streamflow, Riparia land, Riparian rights, Obstruction to flow, Repu sion (Legal aspects).

Plaintiff landowners sought an order requiring defendant drainage district to remove a dam on a bayou, claiming it caused flooding of their land in times of excessive rains. Plaintiff had obtained a temporary injunction against construction of the dam when it was first proposed, but the injunction was dropped when both parties signed a consent decree calling for location of the dam elsewhere at plaintiff's expense. Defendants contended that plaintiffs refused to comply with the decree and that, since the bayou was not a natural watercourse, it could be dammed. The Supreme Court of Mississippi, in affirming a decision for defendant, held plaintiff had abandoned its opposition to the damsite by failure to comply with the consent decree. The court also indicated that while there was ample evidence to support the lower court's finding that the bayou was only a watercourse during flooding, such a finding was not necessary. The general rule that riparian proprietors are to be protected against obstructions causing damage does not hold true when other proprietors, through a drainage district, erect works to protect themselves against flooding. One judge dissented. (Morris-Florida)
W71-02338

UNITED STATES V OREGON (OWNERSHIP OF BEDS OF NAVIGABLE AND NON-NAVIGABLE WATERS).
295 US 1, 55 S Ct 610-622 (1935).

Descriptors: *Oregon, *Non-navigable waters, *Lakes, *Ownership of beds, Boundaries (Property), Navigable waters, Federal government, State governments, Legislation, Judicial decisions, Legal aspects, Meanders, Political aspects, Lake beds, Recreation, Real property, Relative rights, Land tenure.

Plaintiff United States brought an action to quiet title to certain submerged lands situated under several connected lakes in defendant state. Plaintiff contended that at the time of defendant's admittance into the Union the lakes were non-navigable and therefore title to the beds remained in the United States. Plaintiff asserted that only title to submerged lands under navigable water passed to states upon their admittance to the Union. Defendant contended that the lakes were navigable upon its entrance into statehood and, in the alternative, that plaintiff had conveyed some riparian property to individuals, and thus the beds were owned by the state. The Supreme Court held that while title to lands underlying navigable waters passes to a state upon its admission to the United States, title to lands underlying non-navigable waters remains in the United States and that whether a grant by the United States of uplands bordering on non-navigable waters carries with it the title to the beds depends upon the intention of the grantor. The court noted that the laws of the United States alone control the disposition of the lands of the United States located within states, and states are powerless to place limitations on such control. (Quesada-Florida)
W71-02339

UNITED STATES V ARIZONA (CONGRESSIONAL AUTHORIZATION REQUIRED FOR FEDERAL DAM PROJECTS).
295 US 174, 55 S Ct 666-673 (1935).

Descriptors: *Arizona, *Dams, *Navigable waters, *Federal-state water rights conflicts, Federal government, State governments, Legal aspects, Legislation, Damsites, Beneficial use, Electric power, Water resources development, Projects, Project purposes, Planning, Judicial decisions, Colorado River, United States, Regulation, Dam construction.

Plaintiff United States sought an injunction to prevent defendant state from interfering with a federal dam project on the Colorado River. Plaintiff contended that the dam project was authorized by Congresss under its power over navigable waters. Defendant contended that while Congress had power over navigable waters, it had not authorized the project in question. Defendant further maintained that the Chief of Engineers had not authorized the project as was required by the National Industrial Recovery Act. The Supreme Court held that the project did not have proper congressional authorization. The United States could not enjoin interference by the state of Arizona as to the proposed dam where the construction of the dam was not properly authorized. (Quesada-Florida)
W71-02340

HILT V WEBER (OWNERSHIP OF LAND ALONG LAKE'S EDGE).
252 Mich 198, 233 NW 159-170 (1930).

Descriptors: *Michigan, *Accretion (Legal aspects), *Riparian rights, *Boundaries (Property), Land tenure, Eminent domain, Compensation, Lake Michigan, Navigable waters, Navigation, Beds, Ownership of beds, Boundary disputes, Damages, Public rights, Surveys, Riparian land, Legal aspects, Judicial decisions, Lakes, Great Lakes.
Identifiers: *Meander lines.

Plaintiffs filed a bill to foreclose a land contract on land bordering Lake Michigan. Defendants claimed fraud in that the boundary of ownership was an old meander line, and consequently relicted land belonged to the state. Defendants were awarded damages. The Supreme Court of Michigan reversed, holding that the shoreline and not the meander line was plaintiffs' true boundary. Under federal law, a purchaser from the government of public land on the Great Lakes took title to the water's edge. Meander lines had no force as boundaries to waters other than the Great Lakes. The court ruled that a prior case, holding that riparian owners on the Great Lakes owned only to the meander line and that the status of land as lake bottom was fixed by the meander line, was incorrect. All riparian owners own to the water's edge. Right to acquisitions to land through accession or reliction is a riparian right. Title to the shoreline is a movable freehold. The state cannot take private property without compensation, which would occur if relicted land were held to belong to the state. Generally, riparian rights are: (1) water utilization for general purposes; (2) to wharf out to navigability; (3) access to navigable waters; and (4) right to accretions. Such rights are property, and in taking them, the state must pay compensation. Such rights do not interfere with the state's paramount right to free and unobstructed use of navigable waters for navigation. (Duss-Florida)
W71-02341

SS KRESGE CO V RAILROAD COMM'N (RIGHT TO CONSTRUCT BUILDING ON BED OF STREAM).

235 NW 4-9 (Wis 1931).

Descriptors: *Wisconsin, *Navigable rivers, *Riparian rights, *Buildings, Administrative agencies, Easements, Public rights, Mississippi River, Navigation, Navigable waters, Beds, Legislation, Bridges, Dams, Water levels, Flow, Obstruction to flow, Permits, Riparian land, Judicial decisions, Legal aspects, Channels, Construction.

Plaintiff brought suit against defendant railroad commission to have declared its right to erect a building over the bed of a river. Plaintiff also sought to restrain defendant from objecting to the issuance of a permit for the erection of the building. Plaintiff alleged that the river was not navigable in that it: (1) had insufficient depth, (2) contained many natural obstructions, and (3) contained many man-made obstructions. The Wisconsin supreme court held, first, that the commission could not be enjoined from objecting to the granting of a permit, as this was a matter within its discretion. Secondly, the fact that the river was not presently navigable, did not mean that there would never be navigation of the river. It is well established that the right of a riparian in the bed of a stream is subject to a public easement of navigation, including the right to improve the stream's navigability. Plaintiff's rights were, therefore, subordinate to the right of the state, as trustee for the public, to improve navigation by eliminating obstructions. (Duss-Florida)
W71-02342

VAN CORTLANDT V NEW YORK CENT RR (PRIVATE RIGHT TO RELIEF FROM PUBLIC NUISANCE).
265 NY 249, 192 NE 401-406 (1934).

Descriptors: *New York, *Navigable waters, *Bridges, *Navigation, Navigable rivers, State governments, Railroads, Adjudication procedure, Legal aspects, Judicial decisions, Highways, Remedies, Damages, Legislation, Bridge design, Boats, Ships, Transportation, Bodies of water, Streams, Rivers, Costs.

Plaintiff riparian owner sought a judgment enjoining defendant railroad from maintaining a rigid bridge across a navigable stream. The lower court found the stream to be navigable and the bridge a public nuisance and impediment to navigation but held plaintiff's action to be barred by laches since the bridge had been in existence for forty years. Both parties appealed, plaintiff from the adverse judgment and defendant from the findings of navigability and nuisance. The Court of Appeals of New York affirmed the trial court's judgment. A delay of forty years did not bar plaintiff from enjoining a continuing nuisance, but did have bearing on the extent and materiality of plaintiff's injury. To maintain an action for a public nuisance plaintiff had to show some injury different in kind from that to the public at large. Removal of the instant bridge would have allowed navigation only to a post road crossing the stream 2400 feet upstream. Construction of a drawbridge and improvement of the channel would have cost $3,750,000. The court held that obstruction of navigation by defendant's bridge did not cause sufficient private damage to entitle plaintiff to relief. (Dye-Florida)
W71-02343

FREED V MIAMI BEACH PIER CORP (INFRINGEMENT OF OCEANFRONT RIGHTS).
112 So 841-846 (Fla 1927).

Descriptors: *Florida, *Riparian rights, *Navigable waters, *Boundaries (Property), Land, Real property, High water mark, Low water mark, Legal aspects, Judcial decisions, Docks, Coastal structures, Concrete structures, Piers, Shores, Beaches, Relative rights.

Plaintiff and defendant owned adjoining lots on the ocean front. Defendant obtained permits for and began to construct a pier extending into the water fronting its property. The pier was not constructed at a right angle to the shoreline and extended to some extent into the waters fronting plaintiff's property. Plaintiff sought to enjoin further construction, contending that the pier would obstruct the distant view from his property, which was occupied by a casino. The Supreme Court of Florida affirmed a judgment for defendant. Riparian owners on navigable waters have a right of access and a right to a reasonably unrestricted distant view. Riparian rights in the instant case extended not along extensions of the land lines but on lines at right angles to the high water mark from the corners of the lots. Defendant's pier extended across lines so drawn, but only a minor restriction of plaintiff's view resulted. Plaintiff's right of access was unimpaired. The court held that plaintiff's rights were not infringed to the extent necessary to justify relief at the state of construction defendant had reached. (Dye-Florida)

LAND V BROCKETT (TITLE TO UNMEANDERED PENINSULA).
162 La 519, 110 So 740-743 (1926).

Descriptors: *Louisiana, *Boundary disputes, *Boundaries (Property), *Meanders, Land tenure, Legal aspects, Judicial decisions, Land, Real property, Banks, Lakes, Shores, Lake shores, Navigable waters, Surveys, Estimating, Public lands.

Plaintiff, under a patent, held property bordering a lake. The survey of the patent excluded a 90-acre peninsula extending into the lake. Defendant fenced this peninsula and built a homestead and outbuildings thereon. Plaintiff sought to have himself declared owner of the peninsula, contending that his patent conveyed to the water line and thus included the peninsula. The Supreme Court of Louisiana reversed a judgment for plaintiff. Where a patent purports to convey to the water line, the water line is generally the boundary of the property conveyed, even if the meander line of the survey deviates therefrom. One exception to this rule, however, is in cases where the discrepancy is so great in comparison to the amount of land conveyed that it seems certain that not even an approximate meander of the shoreline was attempted. In the instant case 90 acres was omitted, and it could not be said that a meander was attempted. The land was public and open to entry for homestead purposes by defendant. (Dye-Florida)
W71-02345

KITCHING V BEACHLAND DEV CO (OWNERSHIP OF LAND BETWEEN SURVEY LINE AND NAVIGABLE RIVER).
117 So 789 (Fla 1928).

Descriptors: *Florida, *Surveys, *Boundary disputes, *Boundaries (Property), Judicial decisions, Legal aspects, Navigable rivers, Navigable waters, Measurement, Real property, Land tenure.

Defendant owned land, pursuant to a patent, that was located near a navigable river. Plaintiff possessed the unsurveyed land between defendant's tract and the river. Plaintiff brought an action, alleging that defendant was interfering with plaintiff's right of possession. Plaintiff alleged that he had taken appropriate steps to acquire the land under federal homestead laws. Defendant claimed the land occupied by plaintiff on the theory that the river water line, and not the survey line on his patent, was his boundary. The Florida supreme court held that defendant was not entitled to the land lying between the patent survey line and the navigable river. (Powell-Florida)
W71-02346

STATE V STANDARD OIL CO (VALIDITY OF OIL LEASE TO DRY LAKE BED).
164 La 334, 113 So 867-879 (1927).

Descriptors: *Louisiana, *Lake beds, *Leases, *Ownership of beds, Boundary disputes, Lakes, Navigable waters, Land tenure, Oil wells, Oil fields, Oil industry, Boundaries (Property), Drainage districts, State governments, Administrative agencies, Legal aspects, Adjudication procedure, Judicial decisions, Remedies, Shores, United States, Sea level, Surveys, Mapping.
Identifiers: Levee districts.

Plaintiff state sued defendant oil company to recover the value of oil produced by defendant's wells on a dry lake bed allegedly owned by plaintiff. Defendant had leased the land from a levee district which had been granted the land by the state. Plaintiff contended that the wells were not included in the lease but were on land excluded by a surveyor from the plat incorporated into the lease and since repossessed by the state. Plaintiff also argued that, since the lake was navigable upon the state's admission to the Union, the dry bed was sovereign property and not subject to ownership by the levee district. On rehearing, the court held that the surveyor's error in excluding the land in question did not prevent the parties to the lease, defendant and the levee district, from affirming their intention to include the property in the lease. The court also noted that the decree revesting the land in the state did not act retroactively so as to give the state a cause of action which had already accrued to the levee district. The court vacated its prior judgment and affirmed the judgment for defendant. (Liptak-Florida)
W71-02347

ARCHER V BOARD OF MISSISSIPPI LEVEE COMM'RS (RIPARIAN RIGHTS INCLUDE TAKING GRAVEL FROM RIVER).

130 So 55-56 (Miss 1930).

Descriptors: *Mississippi, *Eminent domain, *Riparian rights, *Boundaries (Property), Condemnation, Riparian land, Riparian waters, Judicial decisions, Legal aspects, Levees, Gravels, Sands, Ownership of beds, Beds, Navigable rivers, Navigable waters, Mississippi River, Flood control, Federal government, Governments, State governments, Water rights.

Defendant owned land abutting the Mississippi River. The chief value of defendant's property was the riparian rights to land in the river for procuring sand and gravel. Plaintiff board of levee commissioners instituted a proceeding to condemn defendant's property. The trial judge instructed the jury not to take into consideration any value of the gravel in the river in determining the value of defendant's condemned property. Defendant appealed the damages award of the trial court for insufficiency. The Supreme Court of Mississippi held that the instruction not to consider the value of gravel in the river channel was reversible error. The court stated that defendant's riparian rights included the right to use land to the center of the stream and to take sand and gravel for commercial purposes, and the taking of such right should have been considered in plaintiff's damages award. (Powell-Florida)

CALDWELL V GORE (DUTY OF LOWER ESTATE TO ACCEPT NATURAL DRAINAGE FROM UPPER ESTATE).
144 So 151-153 (Ct App La 1932).

Descriptors: *Louisiana, *Surface drainage, *Obstruction to flow, *Dams, Ditches, Watercourses (Legal), Arkansas, Surface waters, Surface runoff, Overflow, Remedies, Land tenure, Judicial decisions, Legal aspects, Drainage, Drains, Canals, Overlying proprietor, Relative rights, Adjudication procedure.

Plaintiff upper landowner sought to restrain defendant lower landowner from constructing a dam so as to interfere with the natural drainage of plaintiff's property. Defendant admitted the allegations but contended that: (1) plaintiff's property was located in Arkansas while defendant's was located in Louisiana; (2) defendant's estate owed plaintiff's no servitude of drainage of surface water; and (3) plaintiff constructed a ditch through his property and increased the burden of drainage upon defendant's estate. The trial court granted the injunction and the Court of Appeal of Louisiana affirmed. The court pointed out that prior cases had ruled that an estate located in Louisiana owes a servitude to drain an upper estate in Arkansas. The court stated that if plaintiff had made defendant's servitude more burdensome, defendant should have resorted to the courts and invoked the summary remedy by injunction. Defendant's construction of the dam constituted taking the law into his own hands, which action could not be condoned by the courts. (Duss-Florida)

LIPSCOMB V GALOURAKIS (STATE AND COUNTY JURISDICTION TO REGULATE THE TAKING OF SPONGES IN GULF WATERS).
133 So 104-107 (Fla 1931).

Descriptors: *Florida, *Local governments, *State jurisdicition, *Commercial fishing, State governments, Fishing, Fishing gear, Equipment, Legal aspects, Judicial decisions, Legislation, High water mark, Boundaries (Property), Beds, Beds under water, Oceans, Gulfs, Bays, Gulf of Mexico, Aquatic animals.

Defendant sponge fishermen sought habeas corpus from an indictment charging them with violating Florida statutes regulating sponge fishing. Defendants contended that the offenses alleged, since they took place in the Gulf of Mexico, were committed outside the jurisdiction of the county where the indictment was brought. The Supreme Court of Florida reversed a discharge of defendants. All the bottoms of gulfs and natural bays within the limits of the state passed to the state when Florida was admitted to the Union. Counties bordering on the Gulf of Mexico have jurisdiction over that area within the Gulf adjacent to the upland and out to the state boundary line. The jurisdiction is bounded by lines drawn at right angles to the high water mark at each county's upland boundary. States may prescribe means and methods by which products of gulf waters within state boundaries may be taken for private or commercial use. (Dye-Florida)

ATLANTIC COAST LINE RR V HENDRY (LIABILITY OF RAILROAD FOR FAILURE TO PROVIDE DRAINAGE UNDER TRACKS).
150 So 598-599 (Fla 1933).

Descriptors: *Florida, *Obstruction to flow, *Excessive precipitation, *Culverts, Surface drainage, Rainfall, Legal aspects, Judicial decisions, Damages, Railroads, Farms, Crops, Construction, Flood damage, Drainage, Surface waters, Natural flow, Rainfall intensity, Floods.
Identifiers: *Act of God.

Plaintiff farmer sued defendant railroad company for flood damages allegedly caused by defendant's failure to construct enough culverts when bulding a railroad bed. The bed bisected plaintiff's land. Defendant argued that the damage to plaintiff's crops was caused by heavy rains which were an act of God. The Supreme Court of Florida, in affirming a verdict for plaintiff, held that a defendant seeking to assert the defense of an act of God has the burden of showing that he did not also contribute to the damage. There was evidence that defendant knew it was not making sufficient provision for passage of water. Defendant had not proved that all damage was caused by an act of God. (Morris-Florida)
W71-02351

THE KARD (DAMAGES TO BARGE CAUSED BY RAILROAD'S DRAWBRIDGE OVER NAVIGABLE WATERS).

38 F2d 844-848 (ED Pa 1930).

Descriptors: *Pennsylvania, *Bridges, *Railroads, *Navigation, Ships, Admiralty, Damages, Legal aspects, Judicial decisions.

Plaintiff barge owner brought libel against defendant tug and her owners, who impleaded defendant railroad. The tug was towing plaintiff's barge upriver and signaled the railroad to open the drawbridge for their passage. The railroad's agent opened the span only partially, and the barge's derrick collided with the drawbridge, causing severe injury. Through a later misunderstanding between plaintiff and defendant tug, the barge was left unattended and sank overnight. The court noted that the right of navigation is paramount to the railroad's right to maintain the bridge, and that the bridge must be operated so that navigation is not

unnecessarily impeded. Stating that the tug might proceed after having given the opening signal, and that raising the draw was an invitation for the tug to pass through, the court held that the railroad had failed to comply with regulations and was therefore liable for the earlier injury. The additional damages caused by leaving the barge unattended overnight should be apportioned between plaintiff and defendant tug. (Hart-Florida)
W71-02352

PAN-AMERICAN PETROLEUM AND TRANSP CO V GREAT LAKES DREDGE AND DOCK CO (DAMAGES FOR STRIKING OBSTRUCTION IN DREDGED CHANNEL).
27 F2d 442-443 (SD NY 1928).

Descriptors: *New York, *Navigable waters, *Admiralty, *Dredging, Damages, Channels, Navigation, Navigable rivers, Federal jurisdiction, Boats, Judicial decisions, Legal aspects, Rocks, Remedies, Adjudication procedure.

Plaintiff ship company brought libel action against defendant dredging company for damages which one of its ships had sustained in a collision with a submerged object. Libelant alleged that the dredging company, which was deepening the channel, had placed rocks in the channel and that libelant's vessel had struck the rock. The federal district court dismissed libelant's action. Libelant had the burden of proving that its damage was occasioned by striking the rock placed in the channel by the dredging company. Libelant had failed to establish this. Furthermore, the evidence showed that libelant was aware of the dredging and had been warned against piloting vessels too near the dredging operations. (Duss-Florida)

UNITED PAPERBOARD CO V IROQUOIS PULP AND PAPER CO (INTERPRETATION OF DEED WITH RESERVED WATER RIGHTS).
215 NYS 741-748 (1926).

Descriptors: *New York, *Water rights, *Dams, *Land tenure, Riparian rights, Ponds, Relative rights, Judicial decisions, Legal aspects, Preferences (Water rights), Riparian waters, Riparian land, Water utilization, Reasonable use, Adjudication procedure.
Identifiers: *Flashboards.

The lands of plaintiff and defendant, located on a river, originally formed a single tract. The parties' predecessor in title had obtained water from a pond above a dam located above the single tract. In obtaining the water the grantor had placed flashboards on top of the dam. Subsequently, the deed, which conveyed half of the single tract to plaintiff, granted plaintiff all water rights to the pond except rights to the water actually flowing over the crest of the dam. Defendant acquired the remainder of the tract, including the water rights reserved from plaintiff's deed. Plaintiff sought an injunction to enjoin defendant from withdrawing water from the pond. Defendant contended that the deed reservation permitted him to draw pond water whenever its level was higher than the crest of the dam, exclusive of flashboards. Plaintiff contended the water had to be actually flowing over the flashboards. The appellate court, in granting an injunction, held the grant permitted defendant to use only water flowing over the flashboards. The court stated that the water right, as primarily granted, would not be impaired by the exception in the grant further than necessary. (Powell-Florida)
W71-02354

PEOPLE V NEW YORK AND ONTARIO POWER CO (OWNERSHIP OF BEDS OF NAVIGABLE STREAMS).

219 App Div 114, 219 NYS 497-504 (1927).

Descriptors: *New York, *Ownership of beds, *Navigable waters, *Navigable rivers, Navigation, Channels, Beds, Dams, Boats, Islands, Shores, Riparian land, Riparian rights, Land tenure, Public rights, State jurisdiction, Water rights, Permits, Powerplants, Rivers, Streams, Judicial decisions, Legal aspects, Hydroelectric power, St. Lawrence River.

The people of New York brought action in ejectment to recover land in the bed of the St. Lawrence River. The land was claimed by defendant power company and defendant corporation. Defendant power company owned and operated a dam on the River. The trial court dismissed the complaint and the appellate court affirmed. The court stated that the St. Lawrence River was a navigable stream. Rights and title in the beds of navigable streams are controlled by the state law where the stream is located. Title to beds is in the state in trust for the people unless specifically granted to others. The state holds the right to control commerce and navigation, but it may grant, in the public interest, unconditional rights in shore waters or streams. All grants for private benefit are conditional ones and subject to the right of the state to improve the stream. One may not acquire rights which deprive the state of the power to improve navigation. Riparian owners on navigable streams possess the same rights as owners on private streams. Defendant power company was a riparian ownerbut not the owner of the bed where its dam was located. However, none of defendant's construction on the bed obstructed navigation. The court held, therefore, that the state would not be prejudiced by permitting defendant to continue its use until the state adopted a plan for developing the stream. (Duss-Florida)
W71-02355

VAN CORTLANDT V NEW YORK CENT RR (BRIDGE OBSTRUCTING NAVIGABLE STREAM NOT ENJOINED WHERE NO DAMAGE SHOWN).
238 App Div 132, 263 NYS 842-853 (1933).

Descriptors: *New York, *Bridges, *Navigable waters, *Navigation, Streams, Riparian rights, Relative rights, Public rights, Legal aspects, Remedies, Damages, Judicial decisions, Structures, Railroads.

Plaintiff upper riparian landowners sought an injunction to force defendant railroad company to remove a bridge extending across a stream. Plaintiffs contended that, although an accumulation of silt and debris rendered the stream navigable only to small craft, it was still navigable in fact. Plaintiffs therefore maintained that defendant could not erect an obstruction to navigation thereupon. Defendant contended that plaintiffs' had suffered no damage and that their rights had not been impaired. In addition, defendant contended that the stream was not navigable because only small craft could navigate the waters. The New York Supreme Court held that: (1) a stream which at one time has been navigable but because of accumulation of debris and silt is navigable only to small craft is navigable in fact; but (2) where damages are speculative, although the stream might in the future be made profitably navigable, riparian owners are entitled only to nominal damages. (Quesada-Florida)
W71-02356

PIGEON RIVER IMPROVEMENT, SLIDE AND BOOM CO V CHARLES W COX, LTD (USE AND CONTROL OF STREAMS WHICH FORM AN INTERNATIONAL BOUNDARY).
291 US 138, 54 S Ct 361-368 (1934).

Descriptors: *Minnesota, *Navigable waters, *Competing uses, *International waters, Rivers, Legislation, Federal government, State governments, Legal aspects, Judicial decisions, Political aspects, Industrial use, Structures, Dams, Lumbering, Access routes, Riparian rights, International law, Boundaries (Property), Treaties, Relative rights, Regulation.

Plaintiff Minnesota corporation brought an action against defendant Canadian corporation to collect tolls for the use by defendant of improvements maintained by plaintiff in the Pigeon River, a boundary stream between Minnesota and Canada. Plaintiff contended that it was authorized by Congress and the state of Minnesota to maintain such devices and to collect tolls for their use as an aid to commerce. Defendant contended that according to a treaty between the United States and Canada it had the right to the use of the river both in Canada and the United States. The Supreme Court held that congressional acquiescence in the action of the state of Minnesota in authorizing improvements on that part of the river within its jurisdiction constituted a practical construction of the treaty and that the state could authorize the creation of improvements in a navigable river to aid commerce if such improvements were not a violation of the treaty or in conflict with congressional legislation. The trial court's judgment for defendant was reversed. (Quesada-Florida)
W71-02357

WYOMING V COLORADO (ENFORCEMENT OF JUDICIAL DECISION SETTING OUT RELATIVE RIGHTS OF ADJOINING STATES TO QUANTITY OF WATER DIVERTED FROM NAVIGABLE RIVER).
286 US 494, 52 S Ct 621-627 (1932).

Descriptors: *Wyoming, *Colorado, *Diversion, *Relative rights, Diversion dams, Navigable waters, Alteration of flow, State governments, Riparian rights, Irrigation practices, Legal aspects, Judicial decisions, Beneficial use, Public benefits, Adjudication procedure.

Plaintiff state sought to enforce against defendant state an earlier court decree as to the relative rights to divert water from a navigable river which flowed through defendant state into plaintiff state. Plaintiff contended that defendant state was violating the provisions of the decree by diverting water in excess of its allotted amount. Plaintiff maintained that it should be permited to install measuring devices in the river within defendant state in order to insure compliance with the provisions of the decree. Defendant denied that it was diverting water in excess of its quota and refused to allow plaintiff to install the measuring devices. Additionally, defendant contended that if any additional water was being diverted, it was being done by private corporations acting without state authority, for which defendant state was not liable. Defendant further contended that the suit should be dismissed because it contained no specific allegations. The Supreme Court of the United States held that the allegations of plaintiff were sufficient to warrant a determination by the lower court and should not be dismissed. Defendant was required to answer plaintiff's bill. (Quesada-Florida)
W71-02358

UNITED STATES V HOLT STATE BANK (TITLE TO LAND UNDER NAVIGABLE WATER VESTS IN STATE ON ADMISSION TO UNION).
270 US 49, 46 S Ct 197-200 (1926).

Descriptors: *United States, *Lakes, *Navigable waters, *Ownership of beds, Minnesota, Lake beds, Land reclamation, Public lands, Federal reservations, Indian reservations, Boundaries (Property), Land tenure, Federal government, State governments, Navigation, Rivers, Legal aspects, Public rights, Legislation, Judicial decisions, Adjudication procedure.

Plaintiff United States brought suit against defendant bank to quiet title to land that once was a lake bed. Plaintiff argued that the lake was not navigable when Minnesota, defendant's grantor, was admitted to the Union and that the lake was part of an Indian reservation, to be disposed of as homestead property. Defendant argued that the lake was navigable in fact and title to the bed was therefore vested in the sovereignty of the state upon its admission to the Union. Affirming the dismissal of the

complaint, the Supreme Court held that the lake was navigable in fact, even though the lower courts erroneously applied local standards, since the same result would have been reached by applying the federal standard of 'susceptibility to navigation.' The court noted that the United States held submerged lands in trust for future states, and a disposal of such land could not be lightly inferred in the absence of legitimate public purpose or international obligation. (Liptak-Florida)
W71-02359

ARKANSAS POWER AND LIGHT CO V ORR (LIABILITY FOR FLOOD DAMAGE CAUSED BY NEGLIGENT FLOODGATE OPERATION).
298 SW 1029-1032 (Ark 1927).

Descriptors: *Arkansas, *Water injury, *Hydroelectric plants, *Floodgates, Streams, Overflow, Flood damage, Floods, Crop response, Dams, Reservoir operation, Lakes, Legal aspects, Natural flow doctrine, Rainfall, Cloudbursts, Riparian land, Riparian rights, Damages, Judicial decisions, Adjudication procedure.

Plaintiff landowner brought action against defendant power company to recover for flood damage to his corn crop caused by defendant's operation of floodgates at its hydroelectric plant. Plaintiff contended that defendant's employees were negligent in opening the floodgates so as to increase the water flow and cause an overflow of plaintiff's land. Defendant contended that the overflow was the result of heavy rainfall rather than negligence, that such overflow occurred both above and below the dam, and that defendant was not an insurer of the safety of riparian lands. The court noted that submission of the allegation and proof of negligence to the jury was proper and did not operate to make defendant an insurer. However, the court reversed the judgment for plaintiff and remanded the case for a new trial because of the improper admission of hearsay evidence concerning the conduct of defendant's employees in operating the floodgates. (Liptak-Florida)
W71-02360

RYAN V COMM'RS OF WATER DIST NO 1 (NOTICE REQUIRED FOR VALID ASSESSMENT BY WATER DISTRICT).
220 Ky 822, 295 SW 1023-1025 (1927).

Descriptors: *Kentucky, *Assessments, *Water districts, *Adjudication procedure, Remedies, Taxes, Government finance, Water supply, Governments, Local governments, Legislation, Administrative agencies, Administrative decisions, Legal aspects, Judicial decisions, Eminent domain.

Plaintiff landowner sued to declare invalid an assessment and proposed bond issue by defendant water district. Plaintiff contended that the assessment was void for lack of due process because the landowners did not receive notice of the proceedings other than by publication. Defendant argued that the statute creating the water district and authorizing the assessment only required notice by publication and that such notice was sufficient for assessments for public purposes. Affirming a judgment for defendant, the court held that personal notice was only required in actions between citizens, and notice by publication was sufficient for eminent domain or tax proceedings between a citizen and a governmental body. The court also noted that the landowners had waived their right to question the validity of the assessment since none of them appeared at, or objected to, the assessment proceedings or the final court hearing. Moreover, they had not prosecuted an appear from any of those proceedings. (Liptak-Florida)
W71-02361

PRUYN V NELSON BROS (BATTURE LAND SUBJECT TO PUBLIC SERVITUDE FOR USE IN CONSTRUCTING AND REPAIRING LEVEES).
180 La 760, 157 So 585-588 (1934).

Descriptors: *Louisiana, *Levees, *Public rights, *Repairing, Banks, Mississippi River, Navigable rivers, Rivers, Accretion (Legal aspects), Administrative agencies, Administrative decisions, Federal government, United States, State governments, Flood protection, Legal aspects, Judicial decisions, Reasonable use, Riparian land, Riparian rights, Excavation, Eminent domain, Easements, Construction, Supervisory control (Power).
Identifiers: *Servitudes.

Plaintiff riparian owner sued to enjoin defendant contractor from removing soil from batture land on the Mississippi River. The soil was to be used by the local levee district and the federal government to make levee repairs. Plaintiff sought to recover damages for soil already removed. Plaintiff contended that the removal of the soil was unnecessary and that part of the soil removed would be used outside of the levee district's territory by the federal government. Defendant contended that all batture land is subject to a public servitude for the building and repairing of levees, limited only by reasonable use, and that the intended use was necessary and reasonable. Since the levee had already been repaired, the court only considered plaintiff's damage claim. The court noted that the United States government was a proper party to exercise the public servitude, especially where its plans had been approved by the proper state and local agencies. Affirming a judgment for defendant, the court held that the evidence showed that the levee repairs were necessary to protect the public from flooding and that it was not unreasonable for the levee district to authorize defendant to use the most available and suitable soil. (Liptak-Florida)
W71-02362

HICKS V STATE EX REL LANDIS (RIGHT TO MAINTAIN DOCK ON STATE-OWNED LAKE BED SUBJECT TO PUBLIC TRUST).

156 So 603-605 (Fla 1934).

Descriptors: *Florida, *Lake beds, *Public lands, *Docks, State governments, Administrative agencies, Administrative decisions, Lakes, Beds, Navigable waters, Ownership of beds, Public rights, Legal aspects, Judicial decisions, Navigation, Access routes, Permits, Recreation.

Plaintiff state brought action to evict defendant from a portion of the bed of a navigable lake and to compel defendant to remove a wharf and two boathouses which he had erected. Plaintiff contended that land under navigable waters is held by the state in trust for the people, for their navigation and enjoyment, and that defendant was trespassing on such trust property. Defendant contended that the state board of trustees, which held title to all state sovereignty lands, had granted to the county the right to use the land for improvement of public access to the lake. The county had transferred that right to defendant. Reversing a judgment for plaintiff, the court held that the board of trustees could lawfully convey rights in sovereignty lands as long as the conveyance was in promotion of the public interest. (Liptak-Florida)
W71-02363

INLAND WATERWAYS CO V CITY OF LOUISVILLE (CITY'S POWER TO LEASE WATERFRONT FOR PRIVATE WHARF PURPOSES).
227 Ky 376, 13 SW2d 283-288 (1929).

Descriptors: *Kentucky, *Navigable rivers, *Docks, *Leases, Rivers, Ohio River, Inland waterways, Permits, Cities, Local governments, Legislation, Riparian land, Riparian rights, Riparian waters, Public rights, Transportation, Legal aspects, Judicial decisions.

Plaintiff city leased river front property to defendant corporation to develop a river terminal. Plaintiff then brought action to declare the lease invalid and to recover the property. Plaintiff contended that the grant of a franchise to operate a public wharf requires an advertisement and public sale and that the board of public works, which granted the lease, had no power to grant such a franchise. Defendant contended that the city could lease its property for wharf purposes just as any other riparian owner. Reversing a judgment for plaintiff, the court noted that a franchise was a grant of a right which could not be exercised without sovereign authority. However, the right to wharf and lease property was common to all riparian owners. The court also noted that whether the wharf was public or private did not depend on the ownership of the land on which the wharf was built, but the use to which the wharf was put. (Liptak-Florida)
W71-02364

ARKANSAS POWER AND LIGHT CO V BEAUCHAMP (NEGLIGENCE IN DAM OPERATION AS CAUSE OF FLOODING).
43 SW2d 234-237 (Ark 1931).

Descriptors: *Arkansas, *Adjudication procedure, *Dams, *Floods, Damages, Legal aspects, Streams, Judicial decisions, Precipitation excess, Electric power industry, Floodgates, Structures, Flood damage, Flow, Low water mark, Reservoir operation, Floodwater, Overflow, Rain, Rainwater.

Defendant power company operated a dam upstream from plaintiffs' property. During a period of heavy rainfall plaintiffs' lands were flooded and their crops destroyed. Palintiffs sought damages, contending that the damage resulted from negligent operation of defendant's dam. Defendant contended that the damage was caused by normal floodwaters and introduced evidence indicating a lack of negligence. Despite defendant's evidence, a jury found for plaintiffs. Defendant appealed on the grounds that plaintiffs had not proved their case. The Supreme Court of Arkansas affirmed. A verdict supported by some substantial testimony may not be set aside on appeal, even though apparently against a preponderance of the evidence. In the instant case the floodwaters were clear, indicating that they came from the reservoir. Moreover, the waters rose faster than in times before the construction of the dam. Such evidence was sufficient to support a jury's inference of negligence. (Dye-Florida)
W71-02365

MISSOURI PAC RR V BAKER (LIABILITY FOR FLOOD DAMAGE CAUSED BY CLOGGED CULVERT).
64 SW2d 321-322 (Ark 1933).

Descriptors: *Arkansas, *Floods, *Culverts, *Damages, Railroads, Crops, Crop production, Flood damage, Surface drainage, Legal aspects, Adjudication procedure, Judicial decisions, Water injury, Surface runoff, Obstruction to flow.

Plaintiff landowner sued defendant railroad for damages caused by crop flooding. Defendant's railroad culvert became clogged, causing water to back up and flood plaintiff's crops. On appeal, defendant contended that there was insufficient evidence to justify the jury verdict that the clogged culvert caused the damage and that the trial court erred in failing to instruct the jury that it was plaintiff's duty to minimize damages by clearing the culvert himself. The Supreme Court of Arkansas found ample evidence to justify the verdict. Noting that to minimize damages plaintiff would have had to trespass, the court held that under the circumstances plaintiff was not required to clear the culvert. The lower court's decision for plaintiff was affirmed. (Hart-Florida)
W71-02366

BOURLAND V CITY OF FORT SMITH (PROPRIETY OF CITY'S ACTION TO IMPROVE WATER SUPPLY).
78 SW2d 383-386 (Ark 1935).

Descriptors: *Arkansas, *Cities, *Contracts, *Reservoirs, Water works, Financing, Government finance, Interest, Administrative agencies, Water supply, Water rates, Dams, Domestic water, Water sources, Judicial decisions, Legal aspects, Supervisory control (Power), Water pollution.

Plaintiff municipal landowner sought to enjoin defendant city from building a reservoir and conveying such improvmenets to a waterworks district. Plaintiff alleged that the project was an abuse of discretion and that the contracts between the city, waterworks district, and the Public Works Administration were ultra vires. The court determined that the project was necessary because of pollution of the existing water supply, rejecting plaintiff's abuse-of-discretion argument. The court observed that a literal interpretation of the statute creating the waterworks district would justify plaintiff's latter assertion, but stated that the statute's purpose was to furnish the municipality with an adequate water supply. The statute should be liberally interpreted and applied to achieve that purpose. Holding that the project was valid, the court affirmed the lower court's decision for defendant. (Hart-Florida)

CASHION V MEREDITH (OWNERSHIP OF ACCRETED LAND).
64 SW2d 670-674 (Mo 1933).

Descriptors: *Missouri, *Accretion (Legal aspects), *Land tenure, *Real property, Legal aspects, Judicial decisions, Adjudication procedure.

In a suit for ejectment and partition, involving adverse possession, the Supreme Court of Missouri stated that accreted land becomes the property of the owner of the tract to which it attached. (Hart-Florida)
W71-02368

ZOOK V CITY OF LOUISIANA (BLOCKAGE OF DRAIN CAUSED BY CITY'S PAVING OF STREET).
12 SW2d 518-520 (Mo 1929).

Descriptors: *Missouri, *Surface runoff, *Paving, *Diversion, Road construction, Surface waters, Cities, Drains, Alteration of flow, Flood damage, Legal aspects, Damages, Legislation, Channels, Adjudication procedure, Local governments, Ditches, Erosion, Judicial decisions, Overflow, Natural flow, Obstruction to flow.

In an action for damages, plaintiff alleged that when defendant city paved a street near her property, it negligently filled in the gutter which carried surface water therefrom. This caused surface runoff to be diverted onto plaintiff's property. In reversing a lower court decision for the city, the appellate court held that plaintiff had stated a cause of action. Municipalities are liable where, in the construction of streets, surface runoff is forced out of its natural drainage and onto adjacent landowners' property. While the city was entitled to cast off surface waters as a consequence of paving and grading a street, it was not entitled to change the natural flow of surface water and cast it onto plaintiff's property in an increased volume. (Caldwell-Florida)
W71-02369

KENTUCKY ELEC DEV CO'S RECEIVER V WELLS (LIABILITY FOR DAMAGE CAUSED BY DAM MAINTAINED AT UNAUTHORIZED HEIGHT DURING UNPRECEDENTED FLOOD).
256 Ky 203, 75 SW2d 1088-1095 (1934).

Descriptors: *Kentucky, *Dams, *Historic flood, *Public utilities, Water injury, Floods, Backwater, Maximum probable flood, Streams, Hydroelectric plants, Concrete dams, Damages, Legal aspects, Judicial decisions, Prescriptive rights, Eminent domain, Obstruction to flow.

Plaintiff landowner brought action against defendant electric company to recover for flood damages to his land, and also sought to restrain defendant from maintaining the dam at a height higher than that maintained by defendant's predecessor. Plaintiff contended that the new height of the dam interfered with the drainage of his land and that the backwater flooded his crops. Defendant contended that the damage was caused by an unprecedented flood and that the dam could be maintained at any height since defendant was a public service corporation which had the power to obtain the right to dam to the new height by eminent domain. The court noted that, it the extra height of the dam contributed to plaintiff's damage, defendant could still be liable for the results of an unprecedented flood. The court agreed that defendant should not have to remove a permanent portion of the dam, but held that plaintiff should have another cause of action to recover for the permanent damages caused thereby. The court affirmed the damage award and that part of the lower order requiring defendant to remove temporary portions of the dam. However, the court reversed the part of the order requiring defendant to lower the permanent dam structure. (Liptak-Florida)
W71-02370

TOLER V BEAR CREEK DRAINAGE DIST (AUTHORITY OF DRAINAGE DISTRICT TO DIVERT WATER FROM WATERSHED).
106 So 88-94 (Miss 1925).

Descriptors: *Mississippi, *Drainage districts, *Flood control, *Watersheds (Divides), Alteration of flow, Rivers, Drainage practices, Levees, Administrative agencies, Floods, Surface waters, Governments, Legal aspects, Water levels, Diversion, Ditches, Artificial watercourses, Public rights, Benefits, State jurisdiction, Supervisory control (Power), Relative rights, Judicial decisions, Legislation.

Plaintiffs challenged the authority of defendant drainage district to implement a flood control program. The objectionable part of the plan was the digging of three ditches to carry floodwaters out of the district over a divide and into the Sunflower River. Plaintiffs argued that drainage districts were prohibited by statute from diverting water from one watershed to another, and that this would be violated by digging the ditches across a divide. Rejecting the contention, the court held that since the floodwaters would eventually reach the river anyway, regardless of the ditches, the effect of the plan was not to unlawfully transfer water between watersheds. Moreover, the court held that the district was properly established under the police power of the state, the purpose of such districts being to promote the public welfare. The private drainage rights of plaintiffs, landowners within the district, were supplanted by the rights conferred on the district by statute. (Caldwell-Florida)
W71-02371

WYNN V WILSON (SEEPAGE FROM IMPROPERLY CAPPED OIL WELL ALLEGED TO HAVE DAMAGED SPRING AND LAND).
252 Ky 352, 67 SW2d 483 (1934).

Descriptors: *Kentucky, *Oil wells, *Seepage, *Springs, Water supply, Damages, Oil, Well casings, Mixing, Water pollution sources, Adjudication procedure, Legal aspects, Land use, Judicial decisions.

In an action for damages, plaintiff claimed that defendant had improperly plugged an oil well after removal of the casing, thereby causing oil to seep into a spring on plaintiff's property. The court found that although oil was found in the spring some time after the well was improperly plugged, there was no evidence of any seepage from the well into the spring, which was several hundred feet away. Moreover, there was evidence that one of the springs on plaintiff's land had oil in it before defendant's well was drilled, and that no oil had been found in the spring in question until it was cleaned out. Holding that it was probable that the oil had come from a source other than defendant's well, the court reversed a lower court decision for plaintiff. (Caldwell-Florida)
W71-02372

DAWSON V JOHNSON (DISPUTE OVER OWNERSHIP OF STREAM BED).
249 Ky 839, 61 SW2d 878-879 (1933).

Descriptors: *Kentucky, *Boundary disputes, *Boundaries (Property), *Ownership of beds, Meanders, Streams, Land tenure, Legal aspects, Channels, Streambeds, Remedies, Thalweg, Judicial decisions.

Plaintiff sought to assert ownership in the entire bed of a stream forming part of the boundary between his and defendant's property. Defendant claimed that his property extended to the middle of the stream's channel. The court conceded that if each party's deed had conveyed land described as running with the meanders of the stream, each would have acquired title to the middle of the stream. However, the court found that plaintiff's deed, which was prior in time, had conveyed to him ownership of the entire streambed. Therefore plaintiff was entitled to a settlement of the boundary line in his favor. (Caldwell-Florida)
W71-02373

FAIRCHILD V MAYO (DISPUTE AS TO WHETHER A SHIFT IN A STREAM'S CHANNEL RESULTED IN ACCRETION).
232 Ky 778, 24 SW2d 599-600 (1930).

Descriptors: *Kentucky, *Boundary disputes, *Boundaries (Property), *Accretion (Legal aspects), Land tenure, Legal aspects, Streams, Surveys, Judicial decisions, Bank erosion, Meanders, Channels, Channel flow, Thalweg.

A creek ran between plaintiff's and defendant's property, plaintiff's land lying on the south and defendant's on the north. The creek's channel had gradually shifted toward the south so that a 1 1/4 acre tract, the subject of the dispute, lay between the original and the new channel. The crucial question was whether the boundary between plaintiff and defendant was the center of the creek's channel or its northern bank. The court stated that if the center of the channel were the boundary, the disputed tract would be an accretion to defendant's land. If, on the other hand, there were a definite boundary on the north bank, it would not be affected by the channel's shift and the property would belong to the plaintiff. The court held that the original deed set the boundary as the north bank of the stream. Therefore, the disputed tract had not accreted and belonged to the plaintiff. (Caldwell-Florida)
W71-02374

KANSAS CITY FIBRE BOX CO V F BURKART MFG CO (OWNERSHIP OF LAND BY VIRTUE OF ACCRETION).
44 SW2d 325-330 (Ark 1931).

Descriptors: *Arkansas, *Accretion (Legal aspects), *Land tenure, *Lumber, Riparian land, Boundaries (Property), Boundary disputes, Surveys, Legal aspects, Rivers, Damages, Lumbering, Forests, Channels, Judicial decisions.

Plaintiff sought replevin of a quantity of lumber which it claimed had been cut from land belonging to it. The basis of plaintiff's claim was that the tract in question had accreted to other riparian land owned by plaintiff. Conflicting evidence was presented at trial, but the jury found for the plaintiff, rejecting defendant's contention that it held the tract by adverse possession. The appellate court held that the trial judge's instructions as to accretion and other issues presented in the case were correct. Decision for the plaintiff was affirmed. (Caldwell-Florida)
W71-02375

DALY V STATE (NO OBLIGATION RESTS ON STATE TO PROTECT LANDS THAT WOULD BE FLOODED EVEN IN ABSENCE OF STATE-CONSTRUCTED CANAL).
132 Misc Rep 92, 228 NYS 738-41 (1928).

Descriptors: *New York, *Overflow, *Discharge (Water), *Damages, Crop response, Surface waters, Canals, Channel improvement, Excavation, Canal construction, Muck soils, Embankments, Swamps, Floodwater, Flooding, Impounded waters, Landfills, Culverts, Judicial decisions, Legal aspects, Channel morphology.

Plaintiff landowner brought action against defendant state to recover damages for injury to his crops allegedly caused by the overlow of a canal constructed by defendant. The court stated that a landowner can do anything to prevent surface water from coming onto his land from adjoining lands, but he cannot collect it and discharge it in bulk on his neighbor's lands. The court found that the bulk of the water causing plaintiff's damage came from a brook initially and not the canal as charged by plaintiff. The flooding would have occurred even without the construction of the new canal. Defendant had no obligation to protect land which would have been flooded to the same extent if the canal had not been constructed. The claim of plaintiff was dismissed. (Price-Florida)
W71-02376

CITY OF NEW YORK V DYCKMAN MKT TERMINAL CORP (LANDS BETWEEN HIGH AND LOW WATER MARKS ARE CITY'S IN FEE AS PUBLIC LANDS).
130 Misc Rep 103, 224 NYS 207-209 (1927).

Descriptors: *New York, *High water mark, *Public lands, *Boundary disputes, Ownership of beds, Grants, Land tenure, Low water mark, Boundaries (Property), Judicial decisions, Legal aspects, Maps, Real property.

Plaintiff city sought to eject defendant corporation from certain lands, and contended that it owned in fee all lands lying between the high and low water marks on Manhattan Island. Defendant contended the lands in question were granted to the town of New Harlem, and plaintiff never became seized thereof. The Court of Appeal of New York had previously held that the lands between high and low water marks were not conveyed to the inhabitants of New Harlem under a certain grant, but to the city of New York under a specific charter. The issue here was whether the lands described in the complaint were located between the high and low water marks of the Harlem River. The court found that the lands so described laid inshore of the high water mark and therefore held the defendants to be owners in fee simple of the land. A verdict was directed in favor of defendants. (Price-Florida)
W71-02377

DAVISON V CITY OF ANN ARBOR (FAILURE OF PROOF THAT LOWERING OF WATER TABLE WAS DUE TO OTHER THAN NATURAL CAUSES).
237 Mich 453, 212 NE 81-83 (1927).

Descriptors: *Michigan, *Water wells, *Muck soils, *Water table, Pumping, Cities, Wells, Cultivated lands, Damages, Diversion losses, Water demand, Pumping plants, Crop response, Gravel, Percolation, Water supply, Water shortage, Water users, Legal aspects, Judicial decisions.

Plaintiff landowners sought to recover damages and to enjoin defendant city from using its water pumps. Plaintiffs contended that defendant's actions had reduced the water table on their land to the extent of making said land worthless for agricultural purposes. Defendant denied that its pumps had caused any injury to plaintiffs' property. Defendant proved to the satisfaction of the trial court, by expert testimony, that its taking of water at a depth of forty feet below the surface had no material effect on the water table on which plaintiffs relied for their water supply. The court concluded that plaintiffs had sustained no damage by the operation of defendant's pumping station and that the rescission of the flowing wells was not satisfactorily shown to have happened from other than natural causes. The judgment for defendant was affirmed. (Price-Florida)
W71-02378

ANDES V ANDES (WATER RIGHTS SUBJECT TO LEASEHOLD).
173 A 452-458 (Pa 1934).

Descriptors: *Pennsylvania, *Water rights, *Land tenure, *Water supply, Judicial decisions, Legal aspects, Adjudication procedure, Relative rights, Supply, Conjunctive use, Pipelines, Water utilization, Water sources, Use rates, Appropriations, Irrigated land, Irrigation, Damages, Greenhouses.

Plaintiff's grantor owned five coterminous lots served by springwater piped from one of them. Defendant was granted a long-term lease allowing him to use as much water from the spring as was necessary to supply his bottling plant which served a nearby city. Plaintiff was granted adjoining property with rights to the use of water passing through an existing pipe for the use of his two greenhouses and one field. Plaintiff constructed additional greenhouses and expanded his fields. Defendant began to sell water to cities other than the original one. Plaintiff brought an action for damages to his crops caused by defendant's use of all the water of the spring. Defendant answered that plaintiff's water rights were subject to his leasehold. A trial court verdict for plaintiff was reversed by the Superior Court of Pennsylvania. Plaintiff's damages should have been limited to the field and greenhouses existing at the time of his grant. Defendant was liable only to the extent that he used water from the spring for sale to towns other than the one specified in his lease. (Dye-Florida)
W71-02379

HAYS V HOFFMAN (OBSTRUCTION OF DRAINAGE DITCH ALLEGED TO HAVE CAUSED OVERFLOW).
160 SE 852-854 (SC 1931).

Descriptors: *South Carolina, *Obstruction to flow, *Ditches, *Prescriptive rights, Relative rights, Backwater, Legal aspects, Damages, Adjudication procedure, Contracts, Drainage, Overflow, Drainage practices, Drainage water, Surface waters, Surface runoff, Judicial decisions.
Identifiers: Injunction (Mandatory).

Plaintiff sought to enjoin defendant from obstructing a drainage ditch carrying surface water from plaintiff's land. The obstruction caused water to back up and overflow plaintiff's property. Plaintiff claimed a prescriptive right to have water drain from his property through the ditch onto defendant's land. Defendant denied this right, contending that the ditch was dug pursuant to a contract between himself and plaintiff. Plaintiff was alleged to have agreed to dig the ditch through defendant's land so that no water was cast thereon. However, plaintiff only dug some distance onto defendant's property and stopped. When large quantities of water overflowed defendant's land as a result, he obstructed the ditch. The court agreed with defendant, holding that no prescriptive right had been established, and allowed a counterclaim by defendant for damage to his property. (Caldwell-Florida)
W71-02380

TAYLOR V LEXINGTON WATER POWER CO (NEGLIGENT RELEASE OF FLOODWATERS FROM DAM).

163 SE 137-142 (SC 1932).

Descriptors: *South Carolina, *Dams, *Flood damage, *Impounded waters, Floods, Flow control, Public utilities, Relative rights, Riparian land, Damages, Floodgates, Pondage, Backwater, Legal aspects, Excessive precipitation, Dam construction, Adjudication procedure, Compensation, Rivers, Permits, Legislation.

Pursuant to legislative authority, defendant power company constructed a dam across a river. Before the dam was completed, heavy rainfall caused waters to back up behind the dam to a dangerous extent, and defendant opened the floodgates, damaging plaintiff's property. The court held that while the defendant had the right to build the dam, it had to pay for any damage proximately caused to surrounding landowners. This was so even though no negligence by defendant was shown. The court reasoned that because the dam was built under state authority for the public good, any damage caused by the dam was a 'taking' of private property for which compensation must be made. A lower court decision for defendant was reversed. (Caldwell-Florida)
W71-02381

FAIREY V SOUTHERN RY (RAILROAD EMBANKMENT ALLEGED TO HAVE DAMMED SURFACE RUNOFF).
160 SE 274-275 (SC 1931).

Descriptors: *South Carolina, *Embankments, *Repulsion (Legal aspects), *Riddance (Legal aspects), Railroads, Flood damage, Obstruction to flow, Floods, Ditches, Drainage, Surface runoff, Legal aspects, Surface waters, Flood waters, Drainage water, Backwater, Overflow.

In an action for damages, plaintiff claimed than an embankment of defendant railroad had the effect of damming surface runoff during periods of heavy rainfall. This caused water to back up and overflow plaintiff's property. The court dismissed the complaint, holding that the 'common enemy rule' applied. Under this rule, the railroad had the right to protect its right-of-way from surface runoff by any means possible, and any damage to the plaintiff caused thereby was not actionable. The defendant, in dealing with surface water on its own land, was not required to exercise even reasonable care to protect plaintiff from injury. (Caldwell-Florida)
W71-02382

BYRD V PENNSYLVANIA RR (OVERFLOW DAMAGE CAUSED BY PLUGGED RAILROAD CULVERT AFTER HEAVY RAINFALL).
145 SE 722-725 (Va 1928).

Descriptors: *Virginia, *Obstruction to flow, *Excessive precipitation, *Culverts, Surface runoff, Flood damage, Railroads, Embankments, Floods, Structures, Overflow, Natural flow, Adjudication procedure, Legal aspects, Judicial decisions, Overflow, Construction materials.

In an action for damages, plaintiff alleged that during a period of heavy rainfall, defendant railroad had negligently allowed a culvert under its embankment to become plugged by loose cross-ties and other construction material. This caused runoff to back up and overflow plaintiff's property. Defendant contended that it should not be held liable for damage caused by rainfall which was so heavy as not to be reasonably anticipated. The court held that there was sufficient evidence to justify submission of the case to a jury. A verdict for the plaintiff was upheld. (Caldwell-Florida)
W71-02383

BOSWORTH V NELSON (DISPUTE OVER EXISTENCE OF FISHING RIGHTS ALLEGEDLY RETAINED BY GRANTOR).
152 SE 575-581 (Ga 1930).

Descriptors: *Georgia, *Relative rights, *Easements, *Fishing, Water rights, Prescriptive rights, Water utilization, Recreation, Land tenure, Remedies, Adjudication procedure, Boating, Legal

aspects, Judicial decisions, Riparian land, Rivers, Streams, Ponds, Overflow, Public rights.
Identifiers: *Profits (A prendre).

Plaintiff was the original owner of land comprising defendant's tract and the surrounding territory. When plaintiff disposed of his property to defendant's predecessor in title and others, he reserved boating and fishing rights in the streams flowing through the properties. When defendant constructed a recreational facility along one of the streams, plaintiff sought to enjoin defendant from interfering with his retained rights. Defendant contended that plaintiff's 'rights' were void because they constituted an easement, which must be appurtenant to an estate in land. As plaintiff had retained no land, defendant argued, such easement could not exist. The court rejected this contention, holding that plaintiff's rights were profits a prendre, an estate in land which can exist by itself. The court further held that the public could not acquire such rights by prescription. The fact that plaintiff had allowed the public to use the stream for many years did not deprive him of his profit nor vest any rights in defendant. Plaintiff was held entitled to an injunction. (Caldwell-Florida)
W71-02384

HUGGINS V ATLANTIC COAST LINE RR (RAILROAD FILL ALLEGED TO HAVE CAUSED FLOODWATER DAMAGE).

155 SE 839-841 (SC 1930).

Descriptors: *South Carolina, *Railroads, *Obstruction to flow, *Floodwaters, Floods, Rivers, Flood damage, Culverts, Embankments, Backwater, Damages, Overflow, Adjudication procedure, Roads, Landfills, Alteration of flow, Excessive precipitation, Legal aspects, Structures, Judicial decisions.

In an action for damages, plaintiff alleged that during a period of high water, defendants' railroad bed had obstructed the flow of floodwaters. Such obstruction allegedly caused flood damage to plaintiff's property. Conflicting evidence had been presented at trial, some to the effect that a highway parallel to the railroad had obstructed the floodwaters. The court held that enough evidence favoring plaintiff had been presented to justify submitting the case to a jury. Since the jury had found for the plaintiff, the court declined to disturb the verdict, rejecting defendants' contention that it was entitled to a directed verdict. (Caldwell-Florida)
W71-02385

LAUMA V BUNKER HILL AND SULLIVAN MINING AND CONCENTRATING CO (EASEMENT TO DUMP WASTES).
41 F2d 358-361 (9th Cir 1930).

Descriptors: *Idaho, *Water pollution, *Riparian rights, *Easements, Legal aspects, Judicial decisions, Water pollution sources, Water pollution effects, Riparian land, Mining, Damages, Contracts, Competing uses, Wastes, Industrial wastes, Real property, Waste disposal, Mine wastes, Waste dumps.

Defendant mining company deposited wastes and debris in a stream which ran through plaintiff's property. The stream deposited the wastes on plaintiff's land, causing damage to his realty and livestock. Plaintiff sought damages under his right as a riparian owner to receive the waters of the stream in an unpolluted state. Defendant introduced an agreement between itself and plaintiff's grantor, in which plaintiff's grantor conveyed to defendant the right to dump waste and tailings into the stream. The Ninth Circuit Court of Appeals affirmed a judgment for defendant. An agreement for consideration in which a downstream riparian owner conveys the right to pollute a stream to an upstream owner creates an easement binding on the downstream owner's successors in title. (Dye-Florida)
W71-02386

LEITCH V CITY OF CHICAGO (FEDERAL JURISDICTION OF CASES INVOLVING NAVIGABLE STREAMS).
41 F2d 728-732 (7th Cir 1930).

Descriptors: *Illinois, *Federal jurisdiction, *Adjudication procedure, *State governments, United States, Jurisdiction, Judicial decisions, Legal aspects, Navigable waters, Rivers, Streams, Navigation, Damages, Mississippi River, State jurisdiction, Riparian land, Governments.

Plaintiff sought to restrain defendant city from filling in a navigable stream which passed through his land. Plaintiff claimed that the federal courts had jurisdiction, since the stream was a navigable waterway governed by federal law under the Ordinance of 1787. The Seventh Circuit Court of Appeals affirmed dismissal of the complaint. The ordinance of 1787 remains in effect only insofar as not rejected by a state. The United States relinquished control of the rivers of Illinois by legislative act. The State of Illinois assumed control of navigable rivers of the state by statute. Therefore, jurisdiction over such watercourses remains in the state until affirmatively assumed by the United States. (Dye-Florida)
W71-02387

CLARION RIVER POWER CO V SMITH (POWERS OF THE FEDERAL POWER COMMISSION).
59 F2d 861-864 (DC Cir 1932).

Descriptors: *Federal Power Act, *Electric power, *Federal government, *Administration, Federal project policy, Projects, Federal jurisdiction, Hydroelectric plants, Hydroelectric project licensing, Legislation, Legal aspects, Judicial decisions, Jurisdiction, Governments, Administrative agencies, United States, Water resources development, Electric power industry, Public utilities, District of Columbia, Regulation, Supervisory control (Power).

Plaintiff power company was a licensee under the Federal Water Power Act. Plaintiff submitted to the Federal Power Commission, as required by the Act, an estimate of its investment in the licensed project. The commission investigated and determined that plaintiff's estimate was too high. Plaintiff sought in this action a determination that the Commission was without jurisdiction to make any adjudication or order with reference to the cost of the project. The Court of Appeals of the District of Columbia affirmed the trial court's dismissal of the complaint. The Act gives the Commission the authority to investigate investments of licensees in order to determine an equitable return should a project be taken over by the government in wartime as provided by the Act. Specific provisions of the Act require one who accepts a license to submit to governmental audit and investigation. (Dye-Florida)
W71-02388

WASHBURN V CAMPBELL (PAROL PERMISSION AS MERE LICENSE TO MAINTAIN DAM).
267 Mass 285, 166 NE 861-862 (1929).

Descriptors: *Massachusetts, *Dams, *Ponds, *Permits, Ice, Streams, Boundaries (Property), Damsites, Concrete dams, Impoundments, Water storage, Land tenure, Remedies, Judicial decisions, Legal aspects, Relative rights.

Plaintiff sought to enjoin defendant from destroying a dam which had been erected by plaintiff's predecessor with oral permission from defendant's predecessor. The dam, situated in a stream which formed the boundary between the property of the two parties, had created a pond used by plaintiff in the ice business. Defendant argued that plaintiff had acquired no right to maintain the dam through the earlier agreement with defendant's predecessor. The Supreme Judicial Court of Massachusetts, affirming the trial court's decision for defendant, ruled that the parol permission given by defendant's predecessor was merely a license. Such a license was revocable at will both by defendant's predecessor and those who took title under her. The suit was dismissed. (Barker-Florida)
W71-02389

HUNTER V CLEVELAND, C C AND ST L RY (COLLECTION AND DISCHARGE OF WATER IN VOLUME PROHIBITED).
176 NE 710-712 (Ind 1931).

Descriptors: *Indiana, *Railroads, *Drainage systems, *Discharge (Water), Surface waters, Drainage, Drainage water, Ditches, Tiles, Sewers, Drains, Waste water, Septic tanks, Wells, Domestic wastes, Right-of-way, Volume, Relative rights, Remedies, Judicial decisions, Legal aspects, Natural flow, Bridges.

Plaintiff railway sought to enjoin defendants from collecting surface water, waste water, and water from septic tanks and discharging the same through a sewer drain onto plaintiff's right-of-way. Defendants, in developing a subdivision, had constructed a sewer system which emptied into a ditch constructed by plaintiff for the purpose of carrying off normal surface drainage. Plaintiff argued that defendants had so increased the volume and force of discharge as to threaten the safety of plaintiff's track ballast and bridges. Defendant argued that the water was following its natural drainage course, in no way threatened plaintiff's operations, and that plaintiff was bound to provide for drainage of the water since plaintiff's right-of-way interfered with the natural drainage. The Appellate Court of Indiana, affirming a lower decision for plaintiff, ruled that defendants had no right to collect the water and discharge it in volume onto plaintiff's property. (Barker-Florida)
W71-02390

CASHIN V CITY OF NEW ROCHELLE (DAMAGES FROM OVERFLOW OF STREAM).
256 NY 190, 176 NE 138-140 (1931).

Descriptors: *New York, *Overflow, *Flood damage, *Damages, Cities, Streams, Discharge (Water), Flooding, Riparian land, Excess precipitation, Local governments, Sewers, Drainage systems, Drainage practices, Drains, Volume, Right-of-way, Remedies, Judicial decisions, Legal aspects, Impounded waters, Land tenure, Rent.

Plaintiff landowner sought to recover damages to her property. The damages were allegedly caused by defendant city's collection and subsequent discharge of water into a stream flowing through plaintiff's property. It was argued that such discharge caused the stream to overflow and flood plaintiff's lands. Plaintiff further sought removal of an earth mound left by the city when it constructed a sewer through plaintiff's property. The trial court gave judgment for plaintiff, and defendant appealed on the measure of damages. The New York Court of Appeals, reversing the lower decision, ruled that damages for the overflow of land must be based on the difference between the rental value of such land without the overflow and the rental value with the overflow. The court further ruled that the leaving of the mound was merely a breach of condition of the right-of-way granted to defendant by plaintiff's predecessor. Such condition was for the benefit of the grantor only and gave plaintiff no claim against defendant. A new trial was ordered. (Barker-Florida)
W71-02391

BEAN V CENTRAL MAINE POWER CO (APPROPRIATION OF WATER CURRENT).
173 A 498-516 (Me 1934).

Descriptors: *Maine, *Obstruction to flow, *Prior appropriation, *Currents (Water), Riparian rights, Relative rights, Riparian land, Massachusetts, Dams, Judicial decisions, Legal aspects, Adjudica-

tion procedure, Streams, Alteration of flow, Flow, Mill dams, Structures, Mills, Competing uses, Riparian waters, Water utilization, Upstream, Downstream, Flow rates, Channel flow.

Defendant power company erected a dam downstream from plaintiffs' property, thereby decreasing the force of the current in a stream flowing through plaintiffs' land. No water-powered mills had ever been built on plaintiffs' land, but plaintiffs sought damages for the potential loss of water power resulting from the decreased current of the stream. Plaintiffs' claimed that the current was a valuable incorporeal hereditament incident to their property. The Supreme Judicial Court of Maine followed the law of the Massachusetts Colony, presumed to have been accepted by Maine, in finding for defendant. Current, as a potential source of water power, becomes property requiring compensation by a downstream taker only when it has been appropriated by the upstream owner. All riparian owners may use the current, but until some steps are taken to use it, no property interest vests. Defendant was not liable for appropriation of the current. (Dye-Florida)
W71-02392

BOSWORTH V NELSON (DISPUTE OVER BOATING RIGHTS).
158 SE 306-308 (Ga 1931).

Descriptors: *Georgia, *Non-navigable waters, *Boating, *Public rights, Relative rights, Easements, Recreation, Remedies, Adjudication procedure, Legal aspects, Judicial decisions, Ponds, Streams, Land tenure, Structures, Transportation, Fishing, Water rights.

Plaintiff, the original owner of the land of which defendant's tract was a part, had retained boating and fishing rights in the waters on the property when he sold it to defendant's predecessor in title and others. A previous case concerning the same parties had decided that the retention of fishing rights was effective and that a temporary injunction should be granted restraining defendant from interfering with plaintiff's reserved rights. The trial court later made the injunction permanent, and on appeal defendant argued that boating rights stood upon a different footing than fishing rights. Defendant contended that the public had a legal interest in boating upon the waters concerned, either for recreation or transportation purposes. The court rejected this contention, holding that since the case concerned an artificial pond, which was not a navigable body of water, the pond could not be subjected to any public use except by plaintiff's consent. (Caldwell-Florida)
W71-02393

BALDWIN V NEAL (LIABILITY FOR OBSTRUCTION OF STREAM FLOW BY INADEQUATE PASSAGEWAYS UNDER RAILROAD BRIDGE).
80 SW2d 648-650 (Ark 1935).

Descriptors: *Arkansas, *Flooding, *Excessive precipitation., *Obstruction to flow, Damages, Flood damage, Floodwater, Floods, Rain, Rain water, Streamflow, Streams, Rainfall, Railroads, Judicial decisions, Barriers, Flow, Bridges.

In an action to recover damages, plaintiff contended that defendant railroad, in building railroad trestles across a stream, had negligently obstructed the flow of waters of such stream during periods of excessive rainfall. Plaintiff contended that such obstruction caused water to accumulate behind the railroad embankment which resulted in plaintiff's farm land being flooded. Defendant contended that its duty to provide adequate passageways for the waters of the creek did not extend to waters flowing from excessive rainfall. The court held that it was the duty of the railroad company to provide adequate passageways as would permit the flow of the stream's water, even in periods of excessive rainfall. Defendant was thus liable for the flooding damages, and the trial court's judgment for plaintiff was affirmed. (Snow-Florida)
W71-02394

LEISL V CITY OF NEWPORT (LIABILITY FOR OVERFLOW RESULTING FROM INADEQUACY OF CULVERT).
258 Ky 506, 80 SW2d 556-557 (1935).

Descriptors: *Kentucky, *Flooding, *Excessive precipitation, *Obstruction to flow, Damages, Flood damage, Floodwater, Floods, Rain, Rain water, Streamflow, Streams, Rainfall, Judicial decisions, Barriers, Flow, Culverts, Conduits, Overflow.

In an action for damages, plaintiff contended that defendant municipality negligently constructed and maintained a culvert in a creek. Plaintiff contended that the culvert was inadequate to carry off the waters of the creek in heavy rains, and that such culvert caused waters to back up upon his property, thereby flooding and damaging it. Defendant contended that its duty in maintaining the culvert was to allow for carry off of water during ordinary rains, but not during heavy rains. The court held that one constructing and maintaining a culvert in a creek not adequate to carry off the water during ordinary rains is liable in damages caused by any overflow. However, the court held that there was no liability for such overflow resulting from extraordinary or heavy rains. The court affirmed the trial court's granting of defendant's demurrer since plaintiff's complaint alleged that the overflow resulted from heavy rains. (Snow-Florida)
W71-02395

FORKNER V CHESAPEAKE AND O RY (RESTORATION OF NATURAL DRAINAGE COURSE BY CULVERT).
247 Ky 550, 57 SW2d 489-490 (1933).

Descriptors: *Kentucky, *Watersheds (Basins), *Surface drainage, *Culverts, Drainage, Surface waters, Drainage engineering, Drainage water, Surface runoff, Drainage systems, Outlets, Drains, Conduits, Judicial decisions, Flow, Natural flow, Obstruction to flow, Barriers, Railroads.

Plaintiff sought an injunction to require defendant railroad company to stop up a culvert which passed under a railroad bed and discharged drainage water upon plaintiff's property. Plaintiff contended that when the railroad was first constructed there was no culvert, but instead the embankment retained the water on the high side of the track. Plaintiff sought to force defendant to restore this condition. Defendant contended that the natural watershed of the area was such that the drainage water flowed naturally across plaintiff's property. Defendant contended that the culvert merely restored the natural drainage course which the construction of the railroad tract had altered. The court held that defendant had acted correctly in restoring the natural condition by opening up the drain under its track and in restoring the flow as it would have existed if it had never been interfered with initially. The trial court's refusal of an injunction was affirmed. (Snow-Florida)
W71-02396

REUGSEGGER V CHIGAGO GREAT WESTERN RR (LIABILITY FOR FLOODING CAUSED BY OBSTRUCTION OF A STREAM).
29 SW2d 221-223 (Mo 1930).

Descriptors: *Missouri, *Obstruction to flow, *Flooding, *Excessive precipitation, Streams, Streamflow, Flow, Floods, Floodwater, Damages, Flood damage, Backwater, Overflow, Rain, Rain water, Judicial decisions, Railroads, Rainfall, Barriers, Legal aspects, Riprap.

In an action for damages, plaintiff contended that defendant railroad company obstructed a stream by negligently piling into such stream carloads of rocks in an effort to riprap a railroad bed. Plaintiff contended that such obstruction dammed the flow of water in the stream, thereby causing it to back up and overflow onto plaintiff's land. Defendant contended that the flooding had resulted from excessive rainfall and that the creek could not have held all the water even if the rocks had not been in the stream. Defendant thus contended that the rocks were not a proximate cause of the flooding. The court stated that the issue of proximate cause was a jury question. The court in affirming, held that there was sufficient evidence to support the jury's verdict that the rock had been a proximate cause of the flooding. (Snow-Florida)
W71-02397

FRANK V DIERSON (LIABILITY FOR ALTERATION OF NATURAL DRAINAGE DIRECTION).
235 Ky 229, 30 SW2d 950-952 (1930).

Descriptors: *Kentucky, *Surface drainage, *Surface runoff, *Alteration of flow, Drainage, Runoff, Drainage water, Overland flow, Surface waters, Judicial decisions, Diversion, Flow, Natural flow, Legal aspects, Relative rights.

In an action for damages, plaintiff contended that defendant, owner of an adjoining lot, had so filled and elevated his lot so as to divert the natural drainage of surface water and to cast such upon plaintiff's lot. Plaintiff contended that prior to defendant's acts the drainage had been away from plaintiff's lot, but now surface water was cast upon plaintiff's lot, thereby causing much damage. Defendant contended that the evidence was insufficient to establish that he had altered the course of natural drainage. The court held that there was ample testimony and evidence to support plaintiff's contention. The court thus ruled that defendant was liable for damages caused by the diversion of surface water onto plaintiff's land. (Snow-Florida)
W71-02398

WALTER V WAGNER (FLOOD DAMAGE CAUSED BY LANDFILL).
225 Ky 255, 8 SW2d 421-422 (1928).

Descriptors: *Kentucky, *Surface runoff, *Landfills, *Damages, Land utilization, Flood damage, Relative rights, Land tenure, Walls, Legal aspects, Surface waters, Repulsion (Legal aspects), Riddance (Legal aspects), Adjudication procedure.
Identifiers: *Temporary.

Plaintiff and defendant owned adjacent plots of land. Defendant had filled his land, raising the surface of the property above that of plaintiff, and plaintiff had obtained a judgment against defendant for damage resulting from the runoff from defendant's property. Plaintiff subsequently sought damages resulting from another rainfall, and sought to recover the cost of building a wall capable of protecting his lot from the overflow. Defendant claimed that the former judgment was a bar to the subsequent action. The court held that the fill must be considered a temporary condition, as it could be regraded at any time. Therefore, plaintiff could bring an action for each injury suffered. It was proper for defendant to attempt to minimize damages by constructing a wall. Moreover, the fact that defendant had sold the property before the latter action was brought did not relieve defendant of liability, as defendant had created the condition in the first instance. (Caldwell-Florida)
W71-02399

KIGER V SANKO (DAMAGE CAUSED BY EXCESSIVE SURFACE RUNOFF).

1 SW2d 218-223 (Mo 1927).

Descriptors: *Missouri, *Repulsion (Legal aspects), *Surface runoff, *Riddance (Legal aspects), Surface waters, Floods, Flood damage, Ditches, Barriers, Alteration of flow, Obstruction

to flow, Drainage practices, Legal aspects, Relative rights, Drainage water, land tenure, Damages, Embankments.

Plaintiffs and defendants owned adjacent tracts of land. Originally, a ditch which ran through defendants' property channeled surface runoff over portions of the respective tracts so as to cause no damage. Plaintiffs alleged that defendants had filled this ditch and constructed new ones, resulting in large amounts of drainage being cast upon plaintiffs' property with destructive force. Plaintiffs had built an embankment along the common boundary to block flow from these ditches, but this embankment was broken by the flood waters. The court held that, while under the 'common enemy' rule a landowner had the right to rid himself of surface waters, he did not have the right to discharge water in destructive quantities onto adjacent property. The court rejected defendants' contention that the break in plaintiffs' embankment, rather than defendants' actions, had caused the damage. Plaintiffs were not required to build the embankment in the first place. Moreover, the presence of the embankment gave defendants no right to dig ditches in such a way as to cast water upon plaintiffs' land. (Caldwell-Florida)
W71-02400

ROSITZKY V BURNES (FLOOD DAMAGE TO ADJACENT BUILDING CAUSED BY OVERFLOW FROM ROOF).
295 SW 830-833 (Mo 1927).

Descriptors: *Missouri, *Drains, *Structures, *Flood damage, Obstruction to flow, Rainfall, Overflow, Pipes, Storm drains, Legal aspects, Drains, Floods, Leases, Screens, Barriers, Roofs, Land tenure.

In an action to recover water damages, plaintiff alleged that defendant had allowed gravel and other trash to accumulate on defendant's roof. During heavy rainfall, runoff from defendant's roof overflowed onto plaintiff's adjacent building, carrying with it much of this trash and clogging plaintiff's drains. Water was therefore backed up into plaintiff's building, causing flood damage. The court found that plaintiff's drains were negligently clogged. However, defendant contended that it did not occupy the premises in question, but leased it to a third party, and that under Missouri law a lessor was not liable for such damage caused while the tenant was in possession. The appellate court, however, found that there was no allegation or evidence of any lease in the record. Defendant was therefore held liable for the damage caused by the overflow. (Caldwell-Florida)
W71-02401

YOUNG V ILLINOIS CENT RR (RAILROAD EMBANKMENT ALLEGED TO HAVE OBSTRUCTED NATURAL DRAINAGE, CAUSING FLOOD DAMAGE).
220 Ky 322, 295 SW 156-158 (1927).

Descriptors: *Kentucky, *Obstruction to flow, *Overflow, *Railroads, Embankments, Drainage, Natural flow, Ditches, Barriers, Right-of-way, Rivers, Flood damage, Costs, Structures, Floods, Legal aspects, Judicial decisions, Alteration of flow, Damages, Land tenure, Surface waters, Surface runoff.

Defendant railroad had constructed an embankment over plaintiffs' land, blocking the natural drainage of the property. A ditch had been constructed parallel with the embankment to drain the property, but it had become clogged. Plaintiffs sought damages when surface runoff overflowed their property. Affirming a lower court decision for the defendant, the court held that plaintiffs could not recover as the railroad had no duty to maintain the ditch or to provide for the drainage of plaintiffs' land. The ditch was found not to be within the railroad's right-of-way, but on plaintiffs' property. No evidence was found as to who constructed the ditch, or any surrounding circumstances. Also, since plaintiffs had purchased the property after the ditch had become clogged, they were presumed to have known of the situation. There was no evidence that plaintiffs had any expectation that the railroad would maintain the ditch. (Caldwell-Florida)

CALDWELL V GORE (INTERSTATE SURFACE RUNOFF: LOWER SERVITUDE).
175 La 501, 143 So 387-388 (1932).

Descriptors: *Louisiana, *Natural flow, *Repulsion (Legal aspects), *Interstate, Streams, Dams, Flow, Streamflow, Arkansas, Adjudication procedure, Judicial decisions, Legal aspects, Riparian rights, Alteration of flow, Obstruction to flow, Relative rights, Drainage, Drainage water, Running waters, Downstream, Upstream, Riddance (Legal aspects).
Identifiers: *Servitudes.

Plaintiff upland owner owned property in Arkansas. Defendant lower landowner's property was in Louisiana. A stream ran from north to south through the parties' land into a lake on defendant's Louisiana property. Defendant erected a dam on his property impounding water on plaintiff's Arkansas land. Plaintiff sought to have the dam removed, claiming that under Louisiana law the proprietor of a lower estate owes a servitude to an upper estate to receive all the natural drainage therefrom. Under the common law and Arkansas law, no such servitude existed. Both parties were Louisiana residents. The Supreme Court of Louisiana agreed with plaintiff. A lower estate in Louisiana owes servitude to an upper estate in Arkansas to receive all the natural drainage therefrom. Louisiana law will be applied in an action by Louisiana residents owning property in Arkansas against Louisiana proprietors for an act done in Louisiana. (Dye-Florida)

ROBERTSON V BROOKSVILLE AND I RY (CONDEMNATION OF ACCESS TO WATER NECESSARY FOR RAILROAD OPERATION).

129 So 582-587 (Fla 1930).

Descriptors: *Florida, *Condemnation, *Right-of-way, *Access routes, Eminent domain, Legal aspects, Judicial decisions, Adjudication procedure, Easements, Railroad relocation, Real property, Land tenure, Railroads, Transportation, Water rights, Water supply.

Plaintiff railroad sought to condemn access to a supply of water on defendant's property. Plaintiff contended that a railroad might condemn any property reasonably necessary for its operation. Defendant contended that plaintiff had acquired no rights in the water sought to be removed, even though it had been removing it for some time without legal right. The Supreme Court of Florida reversed a trial court judgment for plaintiff. Though a railroad may condemn property necessary for its operation, such an action may not be used to accomplish a futile act. It would be futile to allow condemnation of a right-of-way to a water supply to the use of which plaintiff has no right. Defendant might first be allowed to condemn the water rights, after which right of access might be obtained by eminent domain. (Dye-Florida)
W71-02404

MEYERS V BEAUCHAMP (RIGHT OF RIPARIAN OWNER TO PROTECT HIS LAND).
51 SW2d 545-547 (Mo 1932).

Descriptors: *Missouri, *Riparian rights, *Bank erosion, Riparian land, Riparian waters, Alteration of flow, Watercourses (Legal), Beaches, Gravel, Bridges, Highways, Highway effects, Dams, Erosion, Relative rights, Natural flow, Natural flow doctrine, Judicial decisions, Legal aspects, Obstruction to flow.

Plaintiff and defendant owned land on opposite sides of a river. Plaintiff sought to enjoin defendant from placing obstructions in the river on defendant's side. Defendant counterclaimed and sought to enjoin plaintiff from placing obstructions in a similar manner on his side of the river. The court found that defendant did nothing more than protect his land from being washed away by the current as altered by plaintiff's action. Defendant had a right to protect his land against the waters of the river so long as he did so with due regard for the rights of other riparian owners and did not change the current of the stream so as to injure the banks of a lower or opposite riparian owner. The judgment below dismissing all parties' claims was affirmed. (Price-Florida)

BRATSCHI V LOESCH (RIPARIAN OWNERS OWN TO THE CENTER OF NON-NAVIGABLE STREAMS).
51 SW2d 69-72 (Mo 1932).

Descriptors: *Missouri, *Non-navigable waters, *Boundaries (Property), *Thalwegs, Boundary disputes, Accretion (Legal aspects), Avulsion, Gravel, Legal aspects, Judicial decisions, Channel morphology, Ownership of beds, Beds under water, Real property.

Plaintiff riparian owner brought action to quiet title to a gravel bar located between the bank of the river on which his property abutted and the thread of such river. Defendant contended that plaintiff's property extended only to the bank of the river or in the alternative, that the river had undergone an avulsive change in course, and therefore the true dividing line between his property and that of plaintiff was the center of the river as it ran originally. Consequently, the gravel bar was within defendant's boundaries. The court stated that where a non-navigable stream constitutes the dividing line between two tracts of land, each owner takes to the center of said stream. Where the change in the course of the stream which forms such boundary is slow and gradual, as in the instant case, the boundary line changes with the stream, and thus the center of the stream continues to be the boundary. The trial court's judgment for plaintiff was affirmed. (Price-Florida)
W71-02407

FRIZZELL V LOWE (OWNERSHIP OF ISLAND IN NON-NAVIGABLE RIVER).
294 SW 996-998 (Ark 1927).

Descriptors: *Arkansas, *Islands, *Federal government, *Patents, Public lands, Non-navigable waters, Thalweg, Riparian rights, Shores, Swamps, Meanders, Land tenure, Judicial decisions, Legal aspects, Taxes, Real property, Relative rights.

Plaintiff brought action to enjoin defendant from taking timber from a small island in the Little Missouri River which she claimed through a patent from the Department of the Interior. Defendant claimed the island through a tax deed from the state. The issue was whether the United States had conveyed the tract here involved to the state through a swamp land patent of 1855. The court found that the land had been excluded from the patent, that title to the land had remained in the United States and that plaintiff was the owner of said land through the patent from the Department of the Interior. The court stated that ownership of the land opposite an island would carry with it riparian rights to the thread of the stream, which would include any ordinary island to be expected in

a non-navigable stream, but as defendant was not such an owner, he was in no position to raise the question of riparian rights. The judgment for plaintiff was affirmed. (Price-Florida)
W71-02408

CLINCHFIELD COAL CORP V COMPTON (DIVERSION OF PERCOLATING WATER).
139 SE 308-313 (Va 1927).

Descriptors: *Virginia, *Diversion, *Groundwater, *Percolating water, Percolation, Adjudication procedure, Judicial decisions, Legal aspects, Land, Land tenure, Real property, Subsurface waters, Obstruction to flow, Underground streams, Damages, Mining, Coal mines, Underground, Underground structures.

Defendant's mining shaft collapsed, obstructing the flow of groundwater beneath plaintiff's property. Plaintiff contended that: (1) defendant's shaft extended beneath plaintiff's land; and (2) the underground water flowed in a defined channel and was subject to the diversion limitations of surface streams. The Supreme Court of Appeals of Virginia reversed a trial court judgment for plaintiff. Evidence showed that defendant's shaft was entirely beneath its own property, as was the source of the diverted groundwater. Percolating water is that which may not be inferred by surface conditions to have a defined channel. An owner of land, so long as no malice is involved, may make any reasonable use of the percolating water beneath his land, even if such use results in diversion of water from the lands of others. No malice was alleged in the instant case, and there was not evidence that the water diverted was not percolating water. (Dye-Florida)
W71-02409

HARTZELL V VILLAGE OF HAMBURG (VILLAGE BOUND TO ACQUIRE WATER SUPPLY FOR PUBLIC USE BY CONDEMNATION OR GRANT).
155 Misc 345, 279 NYS 650-658 (1935).

Descriptors: *New York, *Municipal water, Dams, Governments, Artificial use, Beneficial use, Damages, Concrete structures, Obstruction to flow, Reservoirs, Legal aspects, Judicial decisions, Riparian rights, Riparian land, Streams, Natural flow, Condemnation, Compensation, Grants, Diversion.

Plaintiff riparian landowners sought to enjoin defendant village from taking the water of a stream which in its natural course flowed through the lands of plaintiffs. Plaintiffs contended that defendant had dammed the stream and diverted all of its water for the village's inhabitants' domestic uses and had damaged their lands without compensation. Plaintiffs further maintained that defendant collected considerable revenues from the sale of the water diverted. Defendant contended that plaintiffs' action was barred by laches and that defendant had acquired a prescriptive right to the water. The court held that although the village had a statutory right to acquire an adequate water supply, it was bound to acquire such supply by grant or condemnation. Although defendant took most of the stream's water for six years, it did not acquire a prescriptive right to withdraw the water without just compensation to the riparian owners. (Quesada-Florida)
W71-02410

SCHOFIELD V DINGMAN (RIPARIAN RIGHTS OF OWNERS OF LAND WHICH DOES NOT ABUT LAKE).
261 Mich 611, 247 NW 67-68 (1933).

Descriptors: *Michigan, *Banks, *Riparian land, *Easements, Remedies, Relative rights, Navigable waters, Legal aspects, Judicial decisions, Lakes, Boundaries (Property), Shores, Prescriptive rights, Riparian rights, Access routes, Real property, Land tenure, Recreation.

Plaintiff landowners filed an action challenging the claims of defendant riparian landowner to the ownership of the riparian land situated between plaintiffs' land, which overlooked a navigable lake, and the waterline. Plaintiffs contended that their vendor had conveyed to them land on a bluff overlooking the shoreline of the lake with the assurance that they had riparian rights to the land between the bluff and the waterline. Plaintiffs further claimed title to the land by adverse possession, contending that they had built certain structures upon it. Defendant contended that he had acquired the vendor's rights to the land in question upon the vendor's death. Defendant maintained that since the vendor had not conveyed the property to plaintiffs at the time of the original conveyance, the vendor had retained title to it, which had in turn passed to the defendant. The Supreme Court of Michigan held that: (1) riparian rights granted to plaintiffs whose lots were separated from the lake by intervening land gave only an easement appurtenant; (2) plaintiffs had no more than the right of access to the land for recreation; and, (3) the construction of several structures on the land was of too temporary a nature to indicate adverse possession by plaintiff. (Quesada-Florida)
W71-02411

BUSH V CITY OF ROCHESTER (LIABILITY FOR EXPULSION OF SURFACE WATERS UPON LAND OF ANOTHER BY CONSTRUCTION OF A ROAD).
255 NW 256-258 (Minn 1934).

Descriptors: *Minnesota, *Surface drainage, *Drainage water, *Surface waters, Drainage, Damages, Riddance (Legal aspects), Surface runoff, Water spreading, Overland flow, Rain water, Judicial decisions, Drainage effects, Cities, Roadbanks, Roads, Road construction, Diversion.

In an action for damages, plaintiff contended that defendant municipality in building a graded street adjacent to plaintiff's property did not provide for the drainage of surface water. As a result, plaintiff contended that excessive surface water was cast upon his property, thereby damaging it. Defendant contended that the improvement caused no additional surface water to be diverted over plaintiff's land. The court held that surface water could be expelled from one's property. The court also held that the spread and diffusion of water over adjacent land is a necessary consequence of improvements. However, the disposition of surface water must be reasonable and the injury from such disposition to adjacent owners cannot exceed the benefit derived. The court examined the evidence and ruled that it supported the conclusion that the construction of the road had caused an unreasonable diversion of surface water upon plaintiff's land. The jury verdict awarding plaintiff damages was therefore sustained. (Snow-Florida)

FENNEMA V NOLIN (CONSTRUCTION OF DITCH JUSTIFIED WHERE DISCHARGE OF WATER WAS ABOUT SAME AS UNDER THE NATURAL COURSE OF SAID DITCH).
212 NW 702-705 (Iowa 1927).

Descriptors: *Iowa, *Ditches, *Natural flow doctrine, *Backwater, Natural flow, Judicial decisions, Legal aspects, Dams, Outlets, Channel morphology, Channel flow, Channel improvement, Diversion losses, Diversion structures, Tile drains, Overflow, Surface waters, Accretion (Legal aspects).

Plaintiff trustees brought action to enjoin defendant from maintaining a drainage ditch on his lands and from maintaining a dam which plaintiffs alleged was located in an old water channel. Plaintiffs contended that such constructions diverted water onto defendant's land in such a way as to cause water to back up on plaintiffs' land and prevent proper drainage thereof. The court ruled that defendant was justified in constructing the ditch on his land, and thereby expediting the flow and discharge of water at about the same point where the water was naturally discharged. The evidence failed to show the backwater appreciably interfered with the free flow of water from plaintiffs' property. Neither was defendant responsible for the natural accretions or obstructions that naturally effected the closing of the old water channel even though it resulted in the backing up of water on plaintiff's lands. The judgment for plaintiff was reversed in part and modified in part. (Price-Dale)
W71-02413

PLEASANT LAKE HILLS CORP V EPPINGER (RIPARIAN RIGHTS IN LAKE WHERE BED OWNERSHIP IS IN ANOTHER RIPARIAN OWNER).
235 Mich 174, 209 NW 152-154 (1926).

Descriptors: *Michigan, *Ownership of beds, *Boundaries (Property), *Riparian rights, Beds under water, Boundary disputes, Lakes, Riparian land, Fishing, Boating, Swimming, High water mark, Low water mark, Water rights, Remedies, Judicial decisions, Legal aspects.

Plaintiff corporation sought to enjoin defendant from exercising riparian rights on a lake upon which both parties were riparian owners. An earlier decision by the Michigan Supreme Court had determined that plaintiff's predecessor was the exclusive owner of the entire lake bed. Defendant claimed that the grant to plaintiff's predecessor had reserved in defendant the right of entry onto the lake. Moreover, defendant claimed that he had established title to the narrow strip between the high and low water marks of the lake through adverse possession. The court ruled that no adverse possession had been established, and since it had previously been established that plaintiff's grantor had exclusive ownership of the lake bed, defendant had no riparian rights in the lake. The injunction was granted. (Barker-Florida)

CRAMER V PERINE (TITLE TO ACCRETION DETERMINED BY EXTENSION OF EXISTING BOUNDARIES).
251 NY 177, 167 NE 213-217 (1929).

Descriptors: *New York, *Boundary disputes, *Accretion (Legal aspects), *Boundaries (Property), Riparian land, Streams, Banks, Judicial decisions, Remedies, Legal aspects.

Plaintiff riparian landowner sought to eject defendant neighboring landowner from accretions formed to their lands by a stream which served as a boundary of both plots. Plaintiff claimed that the deed, to his predecessors, from the common grantor of both parties, stated that the division line of the properties was to meet the stream at a specified angle. Plaintiff contended that the old boundary line should be extended on this angle to establish the new boundary on the accretion. Defendant argued that the line should be extended from the old boundary-stream intersection point so as to meet the stream at a right angle. The New York Court of Appeals ruled that in light of the special circumstances of the controversy, title to the accretions should be determined by extending the line from the old intersection point so that it intercepted the stream at right angles. Thus, the accreted land was equally divided between the riparian owners. The lower court's judgment for plaintiff was reversed. (Barker-Florida)

ORNICK V BETHLEHEM MINES CORP (LIA-ILITY FOR DRYING UP OF SPRINGS ESULTING FROM UNDERGROUND MIN-G).

07 Pa 264, 161 A 75-77 (1932).

escriptors: *Pennsylvania, *Springs, *Drying, Mining, Spring waters, Subsurface waters, Un-rground, Groundwater, Water loss, Dry beds, Ju-cial decisions, Coal mines, Mining engineering, egal aspects, Damages, Relative rights.

laintiff brought an action for damages based on an leged drying up of springs on his property. Plain-ff contended that defendant mining company used these springs to be dried up permanently by e removal of coal underneath plaintiff's farm. De-ndant contended that it had a legal right to move the coal and that no causal connection had een established between the drying up of the prings and defendant's mining operations. The ourt held that defendant had the right to mine the oal but that it was liable for any damages the min-g did to the surface. The court ruled that vidence to the fact that the springs dried up at the mes when mining was done directly under them as sufficient to establish a causal connection etween the mining and the drying up of the prings. The jury verdict awarding plaintiff amages was sustained. (Snow-Florida)

LLIANCE MILLS CO V SOCIETY FOR STABLISHING USEFUL MANUFACTURES GRANTS OF FLOWAGE RIGHTS).
42 A 49-50 (NJ 1928).

escriptors: *New Jersey, *Adjudication rocedure, *Water utilization, *Relative rights, Vater supply, Water distribution (Applied), Judi-ial decisions, Legal aspects.

laintiff mill company sought to enjoin defendant ociety from granting flowage rights in a water-ourse to a third person, claiming that such grants ould interfere with plaintiff's earlier grant of such ght. Defendant moved to dismiss the equity action n the ground that the alleged interference was ompensable by damages in law. The New Jersey ourt of Chancery denied the motion to dismiss, aying that evidence on both sides should first be eard. (Barker-Florida)
71-02418

COURTER V BOROUGH OF LINCOLN PARK LOCATION OF BOUNDARY DESCRIBED AS A IVER WHEN THE RIVER CHANGES LOCA-TION).
38 A 99-103 (NJ 1927).

Descriptors: *New Jersey, *Boundaries (Property), Boundary disputes, *Dry beds, Rivers, Avulsion, Accretion (Legal aspects), River beds, Beds, Chan-nels, Judicial decisions, Cities, Taxes, Assessments, Channel morphology.

Plaintiff brought an action to determine which of two municipalities had the right to assess and collect taxes on his land. The land in question was located between a fork of two branches of a river which was the boundary of the two municipalities. The municipality west of the land contended that the eastern branch was the boundary. The eastern municipality contended that the western branch was the boundary. The evidence showed that the western branch had originally been established by the legislature as the boundary. However, the western branch had subsequently dried up and the eastern branch now carried all the water of the river. The western municipality thus contended that the boundary had shifted to the east branch of the river by reason of the western branch drying up. The court ruled that when a boundary line has been once fixed, a subsequent change in the status of the waters does not have the effect of shifting the boundaries. The western branch thus remained the boundary, and the eastern municipality could assess the property between the two branches for taxes. (Snow-Florida)
W71-02419

MAYLENDER V FULTON COUNTY GAS AND ELEC CO (LIABILITY FOR OBSTRUCTION OF NATURAL FLOW).
131 Misc Rep 514, 227 NYS 209-218 (1928).

Descriptors: *New York, *Dams, *Riparian water loss, *Electric power industry, Riparian rights, Riparian land, Reasonable use, Riparian waters, Natural flow, Streams, Streamflow, Public utilities, Water storage, Flow control, Overflow, Priorities, Legal aspects, Judicial decisions, Remedies, Damages, Impoundments, Impounded waters, Obstruction to flow.

Plaintiff lower riparian owner brought action against defendant hydroelectric company for damages allegedly caused by defendant unreasonably reducing and increasing, at various times, the natural flow of a certain creek. Defendant moved to dismiss for failure to state facts showing a cause of action. The facts alleged were that the defendant for 12 years had impounded waters, thereby depriving plaintiff of his rights as a lower riparian owner, and occasionally had discharged large quantities of water. The court granted the motion to dismiss, stating that plaintiff had failed to allege legal injury or show how he was deprived of any right. The court noted that every riparian owner has a right to construct a dam and temporarily detain natural flow for rightful purposes. Each riparian owner is entitled to receive the natural flow except as occasioned by reasonable use of an upper riparian owner who is entitled to first use. (Morris-Florida)
W71-02420

LOWE V INDIANA HYDROELECTRIC POWER CO (CONDEMNATION POWER OF ELECTRIC UTILITY).
151 NE 220-226 (Ind 1926).

Descriptors: *Indiana, *Eminent domain, *Public utilities, *Damsites, Legal aspects, Judicial decisions, Remedies, Riparian land, Condemnation, Compensation, Easement, Right-of-way, Public rights, Electric power, Dam construction, Overflow, Water control, Non-navigable waters, Riparian rights, Rivers, Natural flow doctrine, Legislation.

Plaintiff electric company sought to condemn lands owned by defendant which would be overflowed by water after a dam planned by plaintiff was completed. Defendant contested plaintiff's right to condemn the land without obtaining a certificate of necessity from the state Public Service Commission. Plaintiff owned land on both sides of a non-navigable river. The court held that such ownership gave plaintiff the right to use of the water in the river unless the use damaged other property by retarding the flow or causing other injury. That right would not give plaintiff the right to submerge defendant's land, but the court held that a state statute did give the right of condemnation to and electric utility. The court ruled also that a subsequent statute requiring a certificate of necessity was not applicable to companies covered by the first statute. The trial court's judgment for plaintiff was affirmed. (Morris-Florida)
W71-02421

EAST BAY SPORTING CLUB V MILLER (OWNERSHIP OF NON-NAVIGABLE WATERS).
118 Ohio St 360, 161 NE 12-16 (1928).

Descriptors: *Ohio, *Public rights, *Non-navigable waters, *Fishing, Ownership of beds, Riparian rights, Riparian waters, Navigable waters, Streams, Lakes, Lake Erie, Watercourses (Legal), Tides, Tidal marshes, Fish management, Recreation, Fish conservation, Wildlife, Legal aspects, Judicial decisions, Remedies, Relative rights.

Plaintiff sporting club and game preserve asked that defendant fishermen be enjoined from trespassing on its property, claiming they disturbed breeding grounds and scared wildfowl. Defendants answered that they had the right to fish in navigable waters. Plaintiff's land bordered on Lake Erie, and the waters in question, a lake and two streams, were accessible from such lake. The lower court ruled for defendants, and denied the injunction. The Supreme Court of Ohio agreed the open body of water was part of the bay and thus public, but it enjoined defendants from use of the two streams. The court stated the streams were defined watercourses and did not lose that definition because the water level rose with the tide. Nor could such streams be considered navigable under the definition of water capable of use as a commercial highway. Flat-bottomed fishing boats are not commerce, and, since the streams flowed only from plaintiff's private land, they were owned by plaintiff. (Morris-Florida)
W71-02422

KLEINBERG V RATETT (CONDUIT CARRYING NATURAL STREAM UNDER PROPERTY DOES NOT CONSTITUTE ENCUMBRANCE AGAINST TITLE).
252 NY 236, 169 NE 289-290 (1929).

Descriptors: *New York, *Natural flow doctrine, *Natural streams, *Riparian rights, Legal aspects, Remedies, Riparian land, Easements, Banks, Ownership of beds, Culverts, Channels, Riparian waters, Pipes, Surface waters, Natural flow, Judicial decisions, Relative rights, Real property.

Plaintiffs sought recission of a contract to buy land on the grounds it was encumbered by an easement for a stream which passed through a culvert under the property. Defendant asked for specific performance for the sale, claiming no easement existed. The Court of Appeals of New York reversed a lower court decision granting recission, but declined to order specific performance. The court said the only rights the upper and lower riparian owners had against the property were the natural rights to have the stream flow through its ancient channel. Such a right is not an easement. The conduit which carried the stream under the property was not constructed under agreement with any other owner, nor had it existed for more than 20 years, so no one had any right to enforce maintenance of the pipe; thus there was no encumbrance on the title. (Morris-Florida)
W71-02423

CARETTI V BRORING BLDG CO (LIABILITY FOR POLLUTION OF STREAM).
132 A 619-624 (Md 1926).

Descriptors: *Maryland, *Riparian rights, *Water pollution, *Domestic wastes, Legal aspects, Judicial decisions, Remedies, Water pollution control, Water pollution effects, Water pollution treatment,

Abatement, Waste disposal, Sewage disposal, Septic tanks, Cesspools, Streams, Riparian land, Wastes, Sewage, Local governments.

Plaintiff riparian landowner sought an injunction to prevent defendant land development company from discharging sewage from its development into a stream. The development drained its sewage and waste water from 70 houses into the stream, which had turned from clear to slimy and smelly in a few years. Plaintiff also claimed increased volume was causing the stream to enlarge. Defendant contended conditions were not as bad as portrayed, and that there were other contributors to the pollution. The Maryland Court of Appeals reversed a lower court's judgment for defendant and issued an injunction. The court stated that a riparian owner has a right to receive water in its natural purity and quantity, and the fact that there was more than one polluter was no help to defendant. The court declined to rule against defendant on the quantity of water, however, and allowed defendant a reasonable time to stop pollution in order not to hamper the health of the development's homeowners. (Morris-Florida)
W71-02424

MARINE LIGHTERAGE CORP V LUCKENBACH SS CO (WHARFAGE CHARGES).
139 Misc 612, 248 NYS 71-75 (1931).

Descriptors: *New York, *Regulation, *Docks, *Tariff, State governments, Federal government, Adjudication procedure, Judicial decisions, Legal aspects, United States, Taxes, Costs, Government finance, Governments, Administration, Contracts, Piers, Supervisory control (Power), Regulation.

Plaintiff corporation sought a declaratory judgment relieving it of wharfage charges levied by defendant wharf owner. The Supreme Court of New York dismissed the complaint. Wharfage is a charge for use of a wharf by way of rent. Duty of tonnage is a tax imposed for the privilege of using a harbor, and can only be imposed by Congress. Wharves may be regulated by the state in which they are located, in the absence of congressional legislation, if state statutes doe not discriminate against interstate commerce. Defendant was entitled to exclusive use of his wharf as regulated by the state. Complete relief was available to plaintiff under the statutes relating to wharfage, and therefore plaintiff was not entitled to a declaratory judgment. (Dye-Florida)
W71-02426

VROOMAN V STATE (LIABILITY FOR FLOOD DAMAGE).
141 Misc 786, 253 NYS 268-275 (Ct Cl 1931).

Descriptors: *New York, *Damages, *Floods, *Land development, Dams, Overflow, Running waters, Flooding, Accidents, Flood damage, Legal aspects, Remedies, Judicial decisions, Structures, Flood control, Islands, Impoundments, Impounded waters.

Plaintiff landowner brought an action for damages against defendant state alleging that the raising of the surface elevation of a state-owned island caused flood damage to his upstream property. Plaintiff contended that the raised surface elevation of the island located in the river upon which his property abutted caused the river to overflow its banks when a large quantity of water flowed downstream after an ice jam. Plaintiff maintained that if the island had not been raised, the water would not have backed up, and thus no flooding would have occured. Defendant contended that there was no evidence to show that the raised level of the island caused the flooding. The court, in holding for defendant, ruled that the evidence was insufficient to warrant a finding that the raised surface elevation of the island caused the upstream flooding. (Quesada-Florida)
W71-02472

MACRUM V HAWKINS (REGULATION OF BRIDGE CONSTRUCTION).
235 App Div 370, 257 NYS 287-296 (1932).

Descriptors: *New York, *Navigable waters, *Federal jurisdiction, *State jurisdiction, Bridge construction, Bridges, Highways, Tidal waters, Obstruction to flow, Navigation, Federal government, State governments, Judicial decisions, Legal aspects, Dredging, Public benefits, Taxes, Legislation Local governments, Regulation, Supervisory control (Power).

Plaintiff taxpayers sought to enjoin the implementation of a resolution by defendant Board of Supervisors relating to the construction of certain bridges and highways. Plaintiffs contended, among other things, that the construction of the proposed bridges would interfere with the full flow of tidal waters and impede navigation. The bridges were to span navigable waters wholly within the state. The court stated that congressional approval of the construction of such bridge was not required if the plans were approved by the War Department. When the government approves such a project as was here involved, it is a lawful project even though it interferes somewhat with navigation and the full flow of tidal waters. However, Congress can compel the removal of such bridges when necessary to aid navigation. The authority of the state over waters within the state is plenary and subject only to the power of Congress to regulate interstate commerce. The judgment dismissing plaintiffs' complaint was affirmed. (Price-Florida)
W71-02473

MACRUM V BOARD OF SUP'RS (AUTHORITY OF LOCAL GOVERNMENTS TO BRIDGE NAVIGABLE WATERS).
141 Misc 358, 252 NYS 546-555 (1931).

Descriptors: *New York, *Bridge construction, *Supervisory control (Power), *State governments, Local governments, Federal government, Legislation, Administration, Judicial decisions, Legal aspects, Rivers, Navigable waters, Governments, Administrative agencies, Government finance, Navigable rivers, Highways, Bridges, Project planning, Administrative decisions.

Plaintiff taxpayers sought to enjoin the issue of bonds by defendant county board of supervisors for the construction of bridges over navigable waters of the state. Plaintiffs contended that: (1) authorization of Congress was necessary for the erection of bridges over navigable waters, (2) the ordinance authorizing the bonds was invalid as it was not authorized by special act of the state legislature, and (3) the general legislative acts regarding highways were not broad enough to authorize construction of bridges over navigable waters. The Supreme Court of New York held for defendants. The River and Harbor Appropriation Act allows construction of bridges over navigable rivers without congressional approval when the navigable portions of such rivers lie wholly within a single state. The New York constitution prohibits authorization of bridge construction by special act. The power of the state over such bridges is plenary and delegable. In the instant case the power to build bridges was properly delegated as part of the highway law which allowed counties to build bridges as part of their highway programs. (Dye-Florida)

A COMPARATIVE ANALYSIS OF AMERICAN AND CANADIAN GOVERNMENTAL ARRANGEMENTS FOR THE DEVELOPMENT OF REGIONAL WATER POLICY IN THE COLUMBIA RIVER BASIN,
Washington Univ., Seattle. Dept. of Political Science.
Robert Warren, and Geoffrey Wandesforde-Smith.
Available from NTIS as PB-196 116, $6.00 in paper copy, $0.95 in microfiche. Completion Report, September 1970. 306 p, append. OWRR A-031-Wash (1).

Descriptors: *Public rights, Public benefits, *Governments, *Water policy, Regions, Regional analysis, *Columbia River basin, Columbia River, *Water resources development, *Planning, *Legislation, United States.
Identifiers: Public goods, Regional planning, Environmental values, Planning personnel, Development policy, Diseconomies of scale, Federal system, State water planning, Bureaucratic behavior, Public entrepreneurship, Representation, Technological change.

Organizations created to plan and coordinate the programs of water-related agencies in the Pacific Northwest have consistently failed to induce relevant federal and state agencies to order their priorities in terms of regionally oriented criteria or significantly influence the way these units interact with one another. The study finds that contrary to widely held assumptions, long-range and finely planned regional programs involving the commitment of resources by autonomous entities can occur through entrepreneurial motivations on the part of major actors without central direction. At the same time, the system has build-in biases for continued use of the public goods presently produced by large water-agencies. There is strong resistence from these production agencies and planning personnel to the acceptance of criteria concerning the effect of water projects on the environment, urban areas and social conditions. State governments tend to underinvest in water planning and fail to act as equals with the federal government in joint planning organizations. In considering planning alternatives the study finds that the centralized control of water planning is not possible within the American political system and may be dysfunctional because of scale diseconomies. In British Columbia the Premier has used his powers to establish an integrated water resources development policy as a means to the end of overall economic development of the province. But such a model is not transferable because of differences in the distribution of authority in the two federal systems. The study concludes that the appropriate response to regional water resources development planning would be to increase the level of competition among actors rather than create a centralized mechanism. Proposed steps include stimulating state governments to act more vigorously in their own interest, better equip the existing regional agency, the Pacific Northwest River Basins Commission to carry out certain functions and establish an independent regional agency concerned with research and policy analysis.

MONGAUP VALLEY CO V ROCKLAND LIGHT AND POWER CO (LIABILITY FOR NEGLIGENT PREPARATION OF RESERVOIR BED).

258 NYS 731-739 (Sup Ct 1932).

Descriptors: *New York, *Reservoirs, *Beds under water, *Reservoir operation, Easements, Legal aspects, Judicial decisions, Hydroelectric plants, Damages, Dams, Reservoir storage, Reservoir design, Impoundments, Flooding, Overflow, Nuisance algae, Vegetation, Vegetation effects, Fouling, Reservoir construction, Odor, Odor producing algae, Property values.

Plaintiff landowner sought to enjoin defendant corporation from maintaining an alleged nuisance and sought damages for alleged devaluation of his property adjacent to defendant's reservoir bed. Defendant had withdrawn the water from its reservoir. Plaintiff alleged that offensive odors emanated therefrom, that defendant's action created a nuisance, that the value of his property was reduced and that such injury was due to defendant's negligent preparation of the bed of the reservoir. Defendant contended that no nuisance had been created and that due care had been exercised in preparing the reservoir bed for flooding. The court ruled that whereas the project had been authorized by the legislature, the nuisance theory could not be relied on by plaintiff. For relief to be

anted, negligence had to be shown. The court ld that plaintiff failed to bear the burden of proof he did not show that defendant had not exercised dinary care and skill in preparing the reservoir d. Plaintiff's complaint was dismissed. (Price-a)

TY OF LAWRENCE V MACDONALD ALIDITY OF PIPELINE PERMIT ISSUED BY BLIC WORKS COMMISSIONER).
NE2d 850-859 (1945).

scriptors: *Massachusetts, *Permits, *Pipelines, avigable rivers, Regulation, Water quality con-l, Local governments, Cities, Water supply, In-es, Administrative decisions, Administrative encies, Public rights, Public utilities, Water rks, Legal aspects, Judicial decisions, Adjudica-n procedure, Oil industry.

aintiff city petitioned to quash a license granted defendant public works commission authorizing oil company to lay a pipeline in a navigable river short distance upstream from plaintiff's water pply intake. The court noted that the city had nding to challenge the license because of its sponsibility to provide a suitable water supply for citizens, although other riparian owners might t have such standing. The court also noted that tutes giving control over water supplies to the epartment of Public Health did not restrict defen-nt's authority to issue the license. However, the urt quashed the license on other grounds. (Lip-k-Florida)

INCHESTER V BYERS (LIABILITY FOR AL-ERING NATURAL FLOW OF SURFACE RAINAGE).

6 NC 383, 145 SE 774-775 (1928).

escriptors: *North Carolina, *Diversion, *Altera-n of flow, *Surface drainage, Repulsion (Legal pects), Riddance (Legal aspects), Legal aspects, dicial decisions, Damages, Drainage, Rainfall, cessive precipitation, Surface waters, Surface ru-ff, Rain water, Natural flow, Flow, Land form-g, Landfill, Channels, Obstruction to flow, Flood-g, Flood damage.

aintiff landowner sued defendant adjoining lan-wner for flood damages to his land and house al-gedly caused by defendant's placing of dirt so as divert the natural flow of surface drainage. De-ndant contented excessive rains caused the mage. The Supreme Court of North Carolina, in firming per curiam the trial court's judgment for aintiff, stated that an owner of lower land is bliged to receive surface water which naturally ws from adjoining higher land, and the lower wner may not repel such water. However, the gher owner cannot artificially increase the natu-l quantity of water or change its natural manner flow. (Morris-Florida)

SSEX CO V GIBSON (MEASUREMENT OF ATER RIGHTS FOR MILL USE).
30 A 846-854 (NH 1925).

escriptors: *New Hampshire, *Mills, Water ghts, *Water measurement, Rivers, Dams, Saw-ills, Mill dams, Hydraulic structures, Hydraulic achinery, Sluices, Water wheels, Closed conduits, elative rights, Reasonable use, Preferences Water rights), Water utilization, Legal aspects, Ju-cial decisions, Adjudication procedure, Water ntracts, Prescriptive rights, Flumes.

laintiff sawmill owner sued defendant gristmill wner to ascertain and enforce their respective ater rights in a river. Defendant's water rights ere derived from a deed from plaintiff's predeces-or limiting defendant's rights to the amount of water necessary to run 'three run of stones, corn cracker, and smut mill' and also limiting the width of a flume through which the water flowed. Plaintiff contended that defendant's water rights were limited to the amount of water necessary to operate the specified machinery using modern water wheels which were considerably more efficient than the old wheels. Defendant contended that he was entitled to the amount of water necessary to operate the old water wheels and whatever amount would flow through the specified flume width. Affirming the judgment for plaintiff, the court noted that there was no way of computing the water needed to run the old wheel, that the width of the flume was meaningless without any limitation on the depth and water velocity and that the conduct of both parties after the conveyance clearly indicated that they had contemplated the conversion to the more modern and efficient equipment. (Liptak-Florida)

MARKLE V GROTHE (COLLECTION AND DISCHARGE OF SURFACE WATER).
102 Pa Super 90, 156 A 585-587 (1931).

Descriptors: *Pennsylvania, *Riddance (Legal aspects), *Surface drainage, *Flooding, Repulsion (Legal aspects), Drainage water, Slopes, Small watersheds, Natural flow doctrine, Pipelines, Pipes, Discharge lines, Flood damage, soaking, Wetting, Judicial decisions, Legal aspects, Drainage systems, Surface runoff.

Plaintiff lower landowner sued defendant upper landowner for damages caused by discharge of surface water over plaintiff's property. Defendant excavated for clay in his brick manufacturing business. Surface water which collected in the excavations drained onto plaintiff's land. Plaintiff conceded defendant's right to repulse the surface water, but contended that spring water was also being discharged onto his land which exceeded defendant's right to repulse the water. The court observed that: (1) the upper landowner has a drainage servitude for natural drainage; (2) if unavoidable loss is sustained by the lower tenant without negligence by upper tenant in the exercise of the right to repulse surface water, there is no cause of action for the loss; and (3) the upper landowner cannot concentrate the surface water to be discharged unnaturally, thereby causing injury to the lower owner. The chancellor found that whatever damage plaintiff sustained was solely from discharge of surface water. Determining that the natural flow of surface water was not increased by defendant's actions, the court held that defendant was not liable for plaintiff's injury. The lower court's decision for defendant was affirmed. (Hart-Florida)

DICKINSON V NEW ENGLAND POWER CO (RELATIVE RIGHTS OF DAM OWNER AND LANDOWNER).
257 Mass 108, 153 NE 458-460 (1926).

Descriptors: *Massachusetts, *Dams, *Damages, *Relative rights, Legislation, Streams, Obstruction to flow, Flood damages, Water levels, Compensation, Easements, Flow, Land tenure, Reasonable use, Watercourses (Legal), Riparian rights, Riparian waters, Remedies, Mills, Overflow, Public rights, Legal aspects, Judicial decisions.

Plaintiffs sought to enjoin defendant power company from overflowing their lands without their consent. Defendant had constructed a dam across a non-navigable stream which occasioned the flooding of plaintiff's land above the dam. The same land and defendant had been the subject of a prior suit and petition for an injunction and compensation. The suit for an injunction had been dismissed because the dam was held to be one encompassed within a statute permitting construction of dams across non-navigable streams. The petition for compensation was dismissed as defendant was entitled to a reasonable use of the stream for lawful purposes, and the consequential injuries to petitioners' estates were not recoverable. The present suit was maintained on the theory that such flowing without compensation violated the federal and Massachusetts constitutions. The trial court sustained a demurrer to plaintiffs' bill and the Supreme Judicial Court of Massachusetts affirmed. The statute which permitted construction of such dams was consitutional and adequately protected those who suffered more than incidental damages. If plaintiffs' damages had amounted to a nuisance, they would have had a remedy at law. However, if their damage was not a nuisance, it was demnum adsque injuria. (Duss-Florida)

NORTHERN OHIO TRACTION AND LIGHT CO V QUAKER OATS CO (GRANT OF MILLRACE IS REAL PROPERTY, NOT AN EASEMENT).
114 Ohio St 685, 152 NE 5-10 (1926).

Descriptors: *Ohio, *Artificial watercourses, *Water contracts, *Real property, Legal aspects, Judicial decisions, Damages, Prescriptive rights, Rivers, Natural flow, Watercourses (Legal), Ownership of beds, Channels, Flow, Water levels, Canals, Water rights, Water users, Mills, Operation and maintenance.

Plaintiff oats company sued defendant railroad company for money plaintiff spent in operating a millrace that defendant had covenanted to maintain. Plaintiff had sold all its interest in two miles of the race to defendant, without warranty, reserving the right to re-enter if defendant failed to continue the flow of waters in the millrace. Defendant, who ceased to maintain the millrace after its planned use of the land failed when it could not eject other occupants of part of the area, contended that its grant was only an easement which could be abandoned at any time. The Supreme Court of Ohio, in affirming a reversal by a lower appellate court of a directed verdict for defendant, held that the millrace, as a tangible and permanent item, was real property. Therefore, defendant took an interest in land, not an easement, from plaintiff which could be abandoned. (Morris-Florida)
W71-02531

STATE EX REL CRABBE V MIDDLETOWN HYDRAULIC CO (RESERVATION OF DIVERSION RIGHTS).
114 Ohio St 437, 151 NE 653-665 (1926).

Descriptors: *Ohio, *Relative rights, *Diversion, *Land tenure, Contracts, Grants, Water utilization, Canals, Streams, Competing uses, Water rights, Water allocation (Policy), Water contracts, Remedies, Adjudication procedure, Judicial decisions, Legal aspects, Water supply.

In an action of quo warranto against defendant landowner, plaintiff state challenged defendant's diversion of water from a stream which was a feeder of a state-owned canal. Plaintiff alleged that it owned the feeder and that defendant was wrongfully diverting water from it to be used in defendant's manufacturing plant. Defendant claimed that his predecessor in title had reserved such diversion rights for himself, his heirs and assigns when the land surrounding the feeder was sold to the state over one hundred years earlier. Plaintiff argued that the reservation had been made only for the original grantor and that lands occupied by the state were presumed to be owned in fee simple. The Supreme Court of Ohio, noting the evidence of continued possession and use of the water by parties in defendant's chain of title and testimony of various offcals that the reservation was continuous, ruled that defendant's diversion was under proper authority. The court further noted that for plaintiff's claimed presumption to operate, the state must actually be in full possession, not merely claim such right while allowing conflicting rights to continue. (Barker-Florida)
W71-02532

ERBSLAND V VECCHIOLLA (JURISDICTION OF CITY TO ENFORCE ZONING ORDINANCE IN NAVIGABLE HARBOR).
313 NYS 2d 576-578 (App Div 1970).

Descriptors: *New York, *Cities, *State jurisdiction, *Navigable waters, Harbors, Reservation doctrine, Boats, Marinas, Boating, Floats, Pontoons, Zoning, Water zoning, Local governments, Legislation, Administrative agencies, Judicial decisions, Legal aspects, Regulation, Supervisory control (Power).

Plaintiff boatyard owner brought action to prohibit defendant building inspector from enforcing the municipality's zoning ordinances with respect to defendant's boatyard. The alleged violation was caused by plaintiff's floats in the harbor. Plaintiff asserted that since the harbor was navigable, his floats were beyond defendant's jurisdiction. Sustaining this contention, the court held that the navigable waters of the harbor were within the sole jurisdiction of the state, precluding defendant from enforcing the ordinance. The lower court's decision for defendant was reversed. (Hart-Florida)
W71-02533

SINCLAIR REFINING CO V KEISTER (LIABILITY FOR POLLUTION OF WATER SUPPLY BY LEAKAGE OF GASOLINE TANK).
64 F2d 537 (6th Cir 1933).

Descriptors: *Water wells, *Gasoline, *Water pollution sources, *Ohio, Storage tanks, Water pollution, Pollutants, Path of pollutants, Pollutant identification, Impaired water quality, Fuels, Oil wastes, Oily water, Wells, Underground, Percolation, Penetration, Permeability, Judicial decisions, Legal aspects.

In an action for damages, plaintiff contended that defendant oil company was liable for maintaining a defective storage tank adjacent to plaintiff's property. Plaintiff contended that leakage of gasoline from the tank percolated into plaintiff's well and polluted her water supply. Defendant contended that gasoline from the tank could not have percolated through the earth and into plaintiff's well. In a per curiam decision, the court held that the question of liability was for the jury and that there was sufficient evidence on the record to support the jury's verdict for plaintiff. (Snow-Florida)
W71-02534

TERRITORY OF HAWAII V GAY (RIGHT TO DIVERT WATERS BY OWNER OF LAND AT RIVER'S SOURCE).
52 F2d 356-359 (9th Cir 1931).

Descriptors: *Hawaii, *Diversion, *Relative rights, *Riparian rights, Irrigation water, Legal aspects, Obstruction to flow, Ownership of beds, Riparian land, Severance, Natural flow doctrine, Diversion dams, Dams, Diversion losses, Water loss, Diversion, Rivers, Flow, River flow, Judicial decisions, Natural flow, Land tenure.

Plaintiff, the territory of Hawaii, brought an action to enjoin defendants from diverting the waters of a river that flowed from its source in the mountains to the sea. Plaintiff contended that it, as a downstream landowner, had certain riparian rights to the flow of the river so as to preclude defendants from damming the river upstream and diverting its waters for irrigation purposes. Defendants, owners of the land at the source of the river, contended that under Hawaiian law and custom the water of a flowing stream belongs to the owner of the land upon which such stream originates. The court held that Hawaiian customary law governed, and thus defendants could divert the waters regardless of the claims of those downstream. The common law with its riparian righrs rules was not applied. The trial court's denial of plaintiff's injunction was affirmed. (Snow-Florida)
W71-02535

UNITED STATES V TUJUNGA WATER AND POWER CO (FORFEITURE OF RIGHTS TO PUBLIC LANDS BY FAILURE TO MEET CONDITIONS OF A GRANT).
48 F2d 689-693 (9th Cir 1931).

Descriptors: *United States, *Public lands, *Easements, *Grants, Reservoirs, Dams, Ditches, Reservoir sites, Drainage systems, Conduits, Channels, Drainage, Irrigation engineering, Federal government, Legislation, Judicial decisions, Right-of-way, Land use, Land tenure, Contracts, Adjudication procedure.

Plaintiff United States brought an action for forefeiture of a grant of an easement on public lands which had been given to defendant canal and ditch company. Plaintiff contended that it had granted to defendant the right to construct ditches and conduit lines upon certain public lands provided that defendant would construct and maintain a dam and reservoir at a given point in the ditch system. Plaintiff contended that defendant had failed to construct the dam and reservoir and that defendant must therefore forfeit its grant of the easement to build conduit lines. Defendant contended that the forefeiture should not be granted since, as a general rule, courts of equity abhor a forfeiture. The court held that the statute authorizing the government to grant rights in public lands also provided for forfeiture of such rights upon the failure of a grantee to meet an agreed upon condition. Defendant's failure to build the dam and reservoir constituted a breach of its agreement and, as such, forfeiture of its rights would result pursuant to the controlling statute notwithstanding traditional rules of equity. (Snow-Florida)
W71-02536

CORBY V RAMSDELL (LIABILITY OF OWNER OF RIVER BED FOR OBSTRUCTIONS TO NAVIGATION).
45 F2d 199-202 (SD NY 1930).

Descriptors: *New York, *Navigable rivers, *Ownership of beds, *Navigation, Ships, Navigable waters, Rivers, River beds, Admiralty, Damages, Barriers, Structures, Beds, Beds under water, Judicial decisions, Hudson River, Docks.

Plaintiff brought an action in admiralty to recover damages for the sinking of his ship. Plaintiff contended that defendant was in possession and control of property under the Hudson River and that defendant had allowed a wharf to decay and become submerged under the water which constituted an unlawful obstruction to the safe navigation of the river. Plaintiff contended that his boat struck upon the wharf and sank. Defendant contended that his predecessor in title had built the wharf and that he had never used it, and therefore he was not responsible for it. The court held that owners of land under navigable water possess rights which are subject to the public's right of navigation. Such owners have an obligation to maintain abutments into the water in such a condition that they do not endanger navigation. This obligation exists by virtue of ownership of the submerged bed and is not dependant upon the actual use of such bed. Defendant was thus held liable for the damages caused by the obstruction which he had knowingly permitted to fall into disrepair. (Snow-Florida)
W71-02537

CITY OF GOLD HILL V CALIFORNIA-OREGON POWER CO (ACQUISITION OF PRESCRIPTIVE RIGHT TO CONSTRUCT DAM).
35 F2d 317-319 (9th Cir 1929).

Descriptors: *Oregon, *Dams, *Easements, *Riparian rights, Obstruction to flow, Relative rights, Diversion structures, Streamflow, Piers, Legal aspects, Remedies, Judicial decisions, Artificial use, Municipal water, Electric power, Hydroelectric plants.

Plaintiff power corporation sought to enjoin defendant city from constructing a wingdam diagonally across the portion of a river of which plaintiff and defendant owned the opposite banks. Plaintiff contended that while defendant had at one time maintained a dam across the river, the dam had long since been washed out and never rebuilt. Plaintiff thus contended that if defendant ever had an easement, it had been abandoned since no dam was ever reconstructed. Defendant contended that it had not abandoned its easement because, while the dam was washed out, a pier which connected the dam with its bank had remained intact for a period after the destruction of the dam. The court held that the evidence sustained a finding that the easement for the dam had been abandoned but that since the statutory period had not yet run as to the pier which remained for a longer period of time, defendant could maintain a structure equivalent in size and diverting capacity to the pier. (Quesada-Florida)
W71-02538

SEWELL V ARUNDEL CORP (TAXPAYERS DO NOT HAVE STANDING TO INTERFERE WITH SUCH WORKS AS CONGRESS HAS AUTHORIZED TO IMPROVE NAVIGABLE WATERS).
20 F2d 503-504 (5th Cir 1927).

Descriptors: *Florida, *Navigable waters, *Supervisory control (Power), *Federal government, Legislation, Local governments, Water policy, Legal aspects, Judicial decisions, Remedies, Permits, Project planning, Public rights, Public lands, Bays, Land forming, Islands, Dredging.

Plaintiff taxpayers sought to enjoin defendant corporation from dredging a shipping channel in Biscayne Bay around which the city of Miami was located. Plaintiffs contended that: (1) according to agreement with the city, the excavation would result in the formation of an artificial island in the bay composed of the dredged materials, and such an island would be an obstruction to navigation; (2) the dredged island would be used by the city for industry and thus destroy the beauty of the bay; and (3) since the grant from the state of Florida to the City of Miami was void because it was not approved by the state legislature, the contract between defendant and the city was void. Defendant contended that its dredging operation was valid since it was conducted pursuant to a permit issued by the Secretary of War as authorized by Congress. The court held that plaintiffs were without standing to sue for the abatement of the nuisance in that it constituted an attempt to interfere with the lawful and ordinary execution of a contract made by authority of Congress. The court also held that while an obstruction in navigable waters is a nuisance which could be abated in a proper proceeding, Congress, having absolute dominion over navigable waters, could authorize such work as it thought necessary to improve such navigable waters. (Quesada-Florida)
W71-02539

WRIGHT V CITY OF RICHMOND (CITY'S LIABILITY FOR FLOODING CAUSED BY INADEQUATE CULVERT).
132 SE 707-709 (Va 1926).

Descriptors: *Virginia, *Culverts, *Flood damage, *Road construction, Natural streams, Roads, Cities, Local governments, Water injury, Rainfall, Cloudbursts, Surface drainage, Surface runoff, Drains, Legal aspects, Judicial decisions, Adjudication procedure, Embankments, Maximum probable flood, Damages, Remedies, Precipitation excess.

Plaintiff homeowner brought action against city for damages to plaintiff's house and property allegedly caused by defendant's negligent construction of a culvert behind plaintiff's property. Plaintiff admitted that the culvert was adequate for the normal flow of water but contended that it was insufficient to take care of the heavy rainfall usually occurring during summer, thereby causing water to back up

and flood plaintiff's property. Defendant contended that plaintiff had released it of all claims arising out of the construction and that plaintiff had failed to notify the city of the claim within six months of the first flooding. Reversing a judgment sustaining defendant's demurrer, the court held that plaintiff's release could only apply to the ordinary consequences of the construction, assuming that defendant did the work in an ordinary and reasonable manner, and did not intend to relieve defendant of its negligence. The court noted that plaintiff's delay in filing his claim would only bar recovery for the first flooding but not for subsequent flooding, notice of which was given promptly. (Liptak-Florida)
W71-02540

BLANKENSHIP V DOWTIN (ENFORCEMENT OF EASEMENT IN WATER SUPPLY ON NEIGHBORING PROPERTY).
133 SE 199-202 (1926).

Descriptors: *North Carolina, *Water supply, *Water rights, *Easements, Groundwater, Pipelines, Preferences (Water rights), Land tenure, Real property, Legal aspects, Judicial decisions, Relative rights, Water contracts, Water utilization, Domestic water, Potable water, Springs, Spring waters, Pumps, Hydraulic equipment, Remedies.

Plaintiff bought a lot at a public auction and also received the right to use the water from a spring and water pump located on his grantor's adjacent lot. Defendant later bought the grantor's lot subject to plaintiff's water rights but disconnected the pump and the water pipes, therby cutting off plaintiff's sole water supply. Plaintiff brought suit and contended that he had a valid easement in the water supply. Reversing the trial court's judgment sustaining defendant's motion for nonsuit, the court held that the only reasonable interpretation of all the circumstances, including defendant's presence at the auction where the land was expressly represented as including the rights to water supply, was that plaintiff had a valid easement in the water supply and that defendant, who bought with notice of those rights, could not disconnect the system or interfere with its use. (Liptak-Florida)
W71-02541

CITY OF PORTSMOUTH V WEISS CITY'S LIABILITY FOR FLOOD DAMAGE CAUSED BY DAM WASHOUT).
133 SE 781-787 (Va 1926).

Descriptors: *Virginia, *Flood damage, *Dam failure, *Cities, Water injury, Damages, Dams, Washouts, Rainfall, Rain water, Surface drainage, Surface waters, Surface runoff, Canals, Drains, Legal aspects, Judicial decisions, Riddance (Legal aspects), Drainage water, Adjudication procedure, Local governments, Legislation, Dam construction, Remedies.

Plaintiff landowner brought an action for damages against defendant city for flood damage to plaintiff's crop of bulbs. Defendant maintained a dam on an abandoned canal and during heavy rainstorms two adjacent canals overflowed, washing out the dam and flooding plaintiff's property. Defendant demurred, contending that plaintiff failed to give the required statutory notice of claim within 30 days of the damage. Plaintiff contended that the notice statute was unconstitutional and that, in any event, the statute did not apply to cases of strict liability but only to claims based on negligence. The court upheld the validity of the statute but noted that it did not apply since defendant, under its authority to maintain the canal, did not have authority to maintain a dam, and plaintiff could recover without showing negligence. The court stated that cities have no right to collect surface water and divert of discharge it to the damage of another's property. However, the court reversed a judgment for plaintiff on procedural grounds, the trial judge having erred in not granting defendant's motion for a bill of particulars as to the damages claimed. (Liptak-Florida)
W71-02542

HARRIS MOTOR CO V PULASKI FURNITURE CO (LIABILITY FOR DAMAGE CAUSED BY REPULSION OF SURFACE WATER BY CONSTRUCTION OF BUILDING).
144 SE 414-417 (Va 1928).

Descriptors: *Virginia, *Surface runoff, *Repulsion (Legal aspects), *Buildings, Surface drainage, Surface waters, Drainage effects, Drainage water, Topography, Riddance (Legal aspects), Drains, Damages, Water injury, Construction, Legal aspects, Judicial decisions, Reasonable use, Relative rights.

Plaintiff and defendant owned adjoining lots on which each constructed a building. Defendant's building obstructed the natural drainage of surface water from plaintiff's property. Plaintiff brought action for damages to his building caused by the resulting accumulation of surface water on his property. Plaintiff admitted that surface water is a common enemy but contended that defendant was unreasonable and negligent in exercising his rights. Affirming the trial court's judgment sustaining defendant's demurrer, the court held that plaintiff's evidence failed to show that defendant had acted in a careless or unreasonable manner since defendant had not altered the natural grade or contour of the property but merely erected a proper building as plaintiff himself had done. (Liptak-Florida)
W71-02543

GEORGIA POWER CO V MOORE (LIABILITY OF POWER COMPANY FOR MAINTAINING NUISANCE).
170 SE 520-525 (Ga 1933).

Descriptors: *Georgia, *Obstruction to flow, *Dams, *Water injury, Barriers, *Riparian rights, Water rights, Judicial decisions, Legal aspects, Dam construction, Flood damage, Dam falure, Earth dams, Public utilities, Hydroelectric power, Backwater, Hydroelectric plants, Dam design, Remedies, Impoundments, Impounded waters.

Defendant power company purchased and repaired a dam. Plant operations were abandoned when a gate feeding the power dam was closed. Subsequently, water backed up the river above the dam, and as a result the creeks and ditches in and below plaintiff upstream landowner's property were filled with mud and sand. The flow of the creeks and ditches was hindered, rendering plaintiff's lands unfit for cultivation. Plaintiff brought a nuisance action, alleging that defendant raised the height of the dam which resulted in the water backup and land damage. Defendant contended that any damage caused by the dam maintenance or construction had been occurring for more than four years prior to institution of the suit and that therefore the suit was barred by the statute of limitations. Defendant further contended that a request to abate, which is a prerequisite to a nuisance suit, was not made. The Court of Appeals of Georgia, in affirming for the trial court's judgment for plaintiff, held that defendant's actions created a fresh nuisance not barred by the statute of limitations. The court stated that a request to abate was not a prerequisite since defendant had knowingly acted to maintain the nuisance. (Powell-Florida)
W71-02544

FRAZIER V LEE (EASEMENTS FOR WATER SUPPLY).
178 SE 722-724 (Ga 1935).

Descriptors: *Georgia, *Easements, *Water rights, *Water supply, Land tenure, Wells, Pipes, Domestic water, Damages, Judicial decisions, Legal aspects, Usufructuary right, Relative rights, Remedies, Adjudication procedure.

Plaintiffs sought an injunction and damages against defendants for interference with plaintiffs' water rights. Plaintiffs obtained their water supply from a windmill located on land adjacent to plaintiffs' which was under control of defendants. Plaintiffs alleged they had a easement in the water which had been obtained for valuable consideration. The grant of water rights had been obtained in a parol agreement with plaintiff wife's father. Plaintiffs alleged that this agreement was a covenant running with the land which would not be interfered with by successors in title. The court reversed the trial court's denial of defendants' demurrer. Plaintiffs' action was against defendants as mere wrongdoers in the commission of acts injurious to water pipes located on the adjacent land and in forbidding plaintiffs to repair the injury, defendants being without interest in the land. However, plaintiffs' alleged right in the property on which the pipes were located on the theory of an easement was not sufficiently evidenced by the allegations, which indicated a personal covenant only, permitting plaintiffs to obtain water but not imposing a burden on the land in the nature of an easement. (Duss-Florida)
W71-02545

RHINES V COMMISSIONERS OF CHATHAM COUNTY (COUNTY'S LIABILITY FOR OVERFLOWING LAND).
179 SE 140-141 (Ga 1935).

Descriptors: *Georgia, *Eminent domain, *Surface drainage, *Remedies, Outlets, Streams, Land tenure, Administrative agencies, Damages, Overflow, Canals, Roads, Drains, Construction, Maintenance, Bridges, Rainfall, Abutments, Legal aspects, Judicial decisions, Local governments, Obstruction to flow, Excessive precipitation.

Plaintiff sought damages from defendant county commissioners, alleging that defendant had appropriated his land for public purposes by defectively constructing a drain which backed up water onto his property. Defendants had constructed a drainage outlet for a creek which allegedly was too small. Heavy rainfall backed water onto plaintiff's land, damaging the land and its buildings. The trial court sustained a demurrer to plaintiff's petition, and the Court of Appeals of Georgia affirmed. The court ruled that plaintiff had failed to state a cause of action. Defendant's acts did not constitute an appropriation of plaintiff's property for public purposes but instead constituted a negligent backing up of water resulting from defective or negligent construction of the improvement. This amounted to an abatable continuing nuisance for which the county was not liable. It is only where property has been damaged by the erection of a public improvement that the owner can recover under the theory that his property was appropriated for public purposes. One judge dissented. (Duss-Florida)
W71-02546

WHITTINGTON V CITY OF BEDFORD (LIABILITY FOR FLOOD DAMAGES CAUSED BY DAM CONSTRUCTION),
210 NW 460-461 (Iowa 1926).

Descriptors: *Iowa, *Dams, *Water levels, *Flood damage, Overlying proprietor, Riparian rights, Rivers, Damages, Judicial decisions, Legal aspects, Riparian land, Relative rights, Competing uses, Diversion, Alteration of flow, Obstruction to flow, Cities, Adjudication procedure, Remedies.

Plaintiff brought suit against defendant city for the erection of a dam downstream from her property which allegedly set back the water of the stream, thereby causing damage to her property by flooding. Defendant conceded at trial that the increase in the height of the water in the river was a technical invasion of plaintiff's rights, but contended that this, without more, would only entitle her to nominal damages. The jury was instructed that any swelling of a stream over its banks by the construction of a dam upon lower real estate is an invasion of the rights of the owner of the upper land who has

the right to the stream in its natural condition. The court found all questions to be merely those of fact for which no disturbance of the lower court's judgment for defendant was necessary. (Barnett-Florida)
W71-02547

KELLOGG V ILLINOIS CENT RR (VALIDITY OF EASEMENTS OVER MORTGAGED LANDS).
213 NW 253-257 (Iowa 1927).

Descriptors: *Iowa, *Railroads, *Easements, *Watercourses (Legal), Judicial decisions, Legal aspects, Bridges, Structures, Crops, Overflow, Right-of-way, Relative rights, Competing uses, Embankments, Damages, Diversion.

Plaintiff brought suit to foreclose a mortgage and to set aside a release and conveyance given by the mortgagor after the execution of the original mortgage. The release gave defendant railroad permission to construct and maintain roads, to divert the flow of water, and to flood the mortgagor's land without liability for damages to crops. This was in addition to defendant's pre-existing easement which allowed maintenance of a bridge and right-of-way across the land. Plaintiff contended that the release executed after execution of the mortgage was inferior to his mortgage claim and that it was an impairment of his security. The Supreme Court of Iowa affirmed a lower court's decision for plaintiff, finding that the grant of the easement to construct and improve the railroad line and to divert the water flow was an impairment of security and thus inferior to plaintiff's equitable lien on the property. (Barnett-Florida)
W71-02548

LYNCH V MINNESOTA POWER AND LIGHT CO (MEASURE OF DAMAGES FOR FLOOD INJURY TO FARMLAND).
219 NW 459-461 (Minn 1928).

Descriptors: *Minnesota, *Damages, *Compensation, *Flooding, Adjudication prodedure, Dams, Flood damage, Saturation, Soaking, Crops, Hay, Crop production, Turf, GRASSES, Depreciation, Judicial decisions, Legal aspects, Water injury.

Plaintiff farm owner sued defendant power company for flood injury to plaintiff's farm. The trial court permitted damages for loss of crops and for permanent injury to plaintiff's sod. Defendant contended that this award resulted in duplication of damages. The court noted that the general rule for crop damages is the value of the crops at the time and place of destruction, in lieu of loss of rental value. The court further determined that if a permanent diminution in land value was caused, then additional compensation should be permitted for this depreciation. Holding that duplication of damages had not occurred, the court affirmed the lower court's decision for plaintiff. (Hart-Florida)

NEKOOSA EDWARDS PAPER CO V RAILROAD COMM'N (AUTHORITY OF STATE TO REGULATE NAVIGABLE STREAMS).
228 NW 144-147 (Wis 1929).

Descriptors: *Wisconsin, *Regulation, *Dam construction, *Navigable waters, State governments, Navigation, Federal government, Streams, Legal aspects, Judicial decisions, Administration, Governments, Legislation, Running waters, Non-navigable waters, Riparian rights, Public rights, Relative rights, Recreation, Supervisory control (Power), Permits.

Plaintiff appealed an order of defendant Railroad Commission which denied plaintiff a permit to construct a dam in a floatable stream. Plaintiff contended that: (1) the stream was not navigable, (2) it had the right as a riparian owner to build a dam whether the stream was navigable or not, and (3) the state lacked the authority to regulate the use of streams. The Supreme Court of Wisconsin affirmed that trial court's judgment for defendant. A navigable stream is one navigable, such stream continues to be considered as navigable although it is no longer used for commerce. It is the state's duty under the Ordinance of 1787 and subsequent statutes to regulate construction of dams in navigable streams and to keep them free for navigation. (Dye-Florida)
W71-02550

NEKOOSA EDWARDS PAPER CO V RAILROAD COMM'N (RIGHT TO OBSTRUCT NAVIGATION).
229 NW 631-632 (Wis 1930).

Descriptors: *Wisconsin, *Riparian rights, *Administrative agencies, *Relative rights, State governments, Public rights, Navigable waters, Obstruction to flow, Legal aspects, Judicial decisions, Dams, Streams, Running waters, Structures, Navigation, Administration, Legislation, Regulation, Supervisory control (Power).

Plaintiff appealed a judgment affirming denial by defendant Railroad Commission of a permit allowing plaintiff to construct a dam across a navigable stream. Plaintiff contended that as a riparian owner before 1911, when a statute vested defendant with authority to allow or deny such construction, it had a vested property right to obstruct navigation which could not later be taken from it. In affirming the judgment for defendant, the Supreme Court of Wisconsin stated that no right to obstruct navigation vests in a riparian owner until a dam has been lawfully built. (Dye-Florida)
W71-02551

HANNA V OLIVER IRON MINING CO (RIGHT TO MAINTENANCE OF WATER LEVEL OF LAKES).
250 Mich 505, 230 NW 900-902 (1930).

Descriptors: *Michigan, *Lakes, *Water levels, *Cities, Local governments, Water supply, Legal aspects, Judicial decisions, Water level fluctuations, Fluctuation, Reservoir management, Height, Land, Real property, Relative rights, Industries, Water resources, Water table, Water works, Surface waters.

Plaintiff owned land situated on a lake used as a source of water by defendant city. The removal of water for domestic purposes significantly lowered the level of the lake. After the level of the lake had declined, plaintiff platted and subdivided her land. Subsequently defendant city became concerned over the lowered level of the lake and contracted with defendant mining company for the pumping of additional water into the lake. This supplementation of the natural sources of water to the lake caused the water level to rise, rendering several of plaintiff's newly platted lots unfit for habitation. Plaintiff sought to enjoin defendant mining company from pumping further water into the lake, contending that the lake was thereby raised above its natural level. The Supreme Court of Michigan affirmed a judgment for defendants. The water in the lake was raised above its level at the time plaintiff platted her property, but the evidence showed that the water was still below its level before construction of defendant city's waterworks. (Dye-Florida)

HENRY V CHICAGO, B AND O RR (PROXIMATE CAUSE OF FLOOD DAMAGE).
235 NW 394-396 (Wis 1931).

Descriptors: *Wisconsin, *Surface drainage, *Bridges, *Obstruction to flow, Streams, Mississippi River, Drainage, Surface runoff, Railroads, Highways, Judicial decisions, Legal aspects, Floods, Flooding, Land, Real property, Crops, Damages, Streamflow, Corn (Field), Structures, Bridge construction, Flood damage, Water injury.

Plaintiff owned farm lands in a narrow valley. North of plaintiff's land was a highway bridge. A stream flowed under the bridge and into a small ditch on plaintiff's property. Defendant railroad maintained a bridge south of plaintiff's land beneath which the stream passed. In a period of heavy rainfall, plaintiff's lands were flooded, therby damaging his crops. Plaintiff sought damages, contending that the opening beneath defendant's bridge was inadequate to allow free flow of the stream, with the result that water was backed up on plaintiff's property. The Supreme Court of Wisconsin reversed a judgment for plaintiff, finding that the opening under defendant's bridge was of a greater capacity than both the highway bridge and the ditch through plaintiff's property. The railroad bridge was capable of handling all water passing beneath the highway bridge and was thus not the proximate cause of plaintiff's injury. (Dye-Florida)
W71-02553

FLAMBEAU RIVER LUMBER CO V CHIPPEWA AND FLAMBEAU IMPROVEMENT CO (COMPANY AUTHORIZED TO OBSTRUCT RIVER FLOW LIABLE FOR EXCEEDING AUTHORITY).
236 NW 679-684 (Wis 1931).

Descriptors: *Wisconsin, *Reservoir operation, *Water levels, *Obstruction to flow, Lumbering, Impounded waters, Alteration of flow, Judicial decisions, Legal aspects, Discharge (Water), Electric power, Hydraulic structures, Dams, Saw mills, Navigation, Navigable waters, Water rights, Reservoirs, Relative rights, Damages, Administrative agencies.

Defendant improvement company, incorporated to improve navigation and river flow, was authorized by statute to obstruct streams through dam construction. Defendant, by operating certain dams, reduced the water level of a river. Plaintiff lumber company abandoned two log drives and ceased operation because of the reduced water level in the river. Plaintiff brought an action for damages and injunctive relief. Plaintiff, whose financial operations in the twelve years preceding this action included gains and losses, alleged loss of profits because of the abandoned log drives. Defendant argued that it was a state agent and as such was immune from liability. The Supreme Court of Wisconsin held that defendant was liable for wrongful acts in exercising or exceeding authority since it was not performing a governmental function. The court held, however, that damages for plaintiff's lost profits were remote and speculative which precluded recovery. The court reasoned that because of the nature of the logging business, the loss of profits might have been occasioned by other factors. Furthermore, if plaintiff had not abandoned all attempts to drive logs, sufficient water might have been furnished. (Powell-Florida)
W71-02554

ROSEMA V CONSTRUCTION MATERIALS CORP (MOORING RIGHTS OF RIPARIAN OWNER ON NAVIGABLE RIVER).
258 Mich 457, 243 NW 24-25 (1932).

Descriptors: *Michigan, *Navigable waters, *Riparian rights, *Reasonable use, Judicial decisions, Legal aspects, Docks, Water rights, Ships, Rivers, Riparian land, Riparian waters, Remedies, Prescriptive rights, Relative rights.

Plaintiffs owned waterfront property on a navigable river. Defendant corporation constructed a dock on its adjoining waterfront property. Defendant daily docked one of its boats alongside its wharf near plaintiffs' property line so that the boat partially projected out into the water in front of plaintiffs' land. Plaintiffs brought an action for injunctive relief, alleging that defendant had no right to moor its boats continually in front of plaintiffs' property. Plaintiffs expressed fear that defendant might claim prescriptive rights to the use of plaintiffs' waterfront. The Supreme Court of Michigan, in reversing the trial court's judgment for plaintiffs,

ield that defendant could moor its boat beside its wharf, even though such mooring over-lapped onto plaintiffs' premises, provided that reasonable access to plaintiffs' land was not obstructed. The court stated that a navigable river is a public highway, navigable in a reasonable way by everyone. The court ruled that defendant could not have acquired a prescriptive right, and therefore plaintiffs' were not entitled to an injunction. (Powell-Florida)
W71-02555

BOARD OF ROAD COMM'RS V MARKLEY (LIABILITY FOR DAMAGES FROM NEGLIGENT DAM CONSTRUCTION).
260 Mich 455, 245 NW 496-498 (1932).

Descriptors: *Michigan, *Dam construction, *Dam failure, *Damages, Construction materials, Dams, Damsites, Dam design, Foundation failure, Washouts, Highways, Culverts, Administrative agencies, Earth materials, Frozen ground, Thawing, Remedies, Costs, Adjudication procedure, Judicial decisions, Legal aspects, Repairing, Dam foundations.

Plaintiff board of commissioners sought to recover damages to a highway caused when defendant's dam collapsed. The dam had been constructed while the earth used for fill was frozen, and when the ground thawed, the pressure of the retained waters caused the collapse. The highway below the dam site was washed out and sections of a concrete culvert were destroyed. The trial court awarded damages to plaintiff. In affirming, the Supreme Court of Michigan ruled that evidence showing the use of frozen earth in dam construction was sufficient to justify a claim of negligent construction proximately causing damage to the highway. The court further held that the measure of damages was a reasonable amount and that evidence of the exact amount spent on repair was admissible in determining such reasonable amount. (Barker-Florida)
W71-02556

CITY OF MADISON V SCHOTT (TITLE TO BED OF NAVIGABLE LAKE).
247 NW 527-530 (Wis 1933).

Descriptors: *Wisconsin, *Ownership of beds, *Navigable waters, *State governments, Governments, Local governments, Cities, Beds under water, Lakes, Meanders, Remedies, Surface waters, State jurisdiction, Adjudication procedure, Judicial decisions, Legal aspects.

In an action to abate alleged nuisances in a lake within the city limits, the city of Madison claimed that title to the lake was held jointly by it and the state in trust for the public. The alleged nuisances consisted of land fill and docks erected by defendants who had no claim of riparian ownership. Defendants claimed that no cause of action was stated since the state was not a party to the suit. The Supreme Court of Wisconsin ruled that title to the bed of the navigable lake was vested in the state in trust for the public, and without the state as a party to such a suit, no action could lie. (Barker-Florida)

STATE V SWEET LAKE LAND AND OIL CO (TITLE TO NON-NAVIGABLE LAKE).
164 La 240, 113 So 833-839 (1927).

Descriptors: *Louisiana, *Lakes, *Swamps, *Ownership of beds, Legal aspects, Judicial decisions, Remedies, State governments, Legislation, Land reclamation, Marshes, Surface waters, Tidal marshes, Navigation, Non-navigable waters, Navigable waters, Highways, Patents, Beds under water.

Plaintiff state sued to obtain title to the bed of an 1,800-acre lake which was located in the middle of 58,000 acres of land owned by defendant company. Defendant's title derived from three state patents. The patents included the lake area, but plaintiff claimed the lake was navigable when Louisiana became a state and thus was not subject to sale. Alternately, plaintiff argued that if the lake was not navigable, it was acquired by the state under the Swamp Land Grants of 1849 and under an 1855 act could not be sold for less than $1.25 an acre. Defendant claimed the lake was never navigable and that it was sold to defendant's predecessor in title under an 1880 act which allowed sale of the whole area for 12 1/2 cents an acre. The Supreme Court of Louisiana, in affirming a decision for defendant, held the lake was not navigable in 1812. It was surrounded by swampland until defendant's predecessor in title started reclaiming the land and built a canal to the lake. The lake had never been used for commerce, and since it was not susceptible to use for commerce, the lake was not navigable in fact, thus not in law. The court held further that the 1880 act superseded the 1855 act. (Morris-Florida)
W71-02559

COLUMBUS AND GREENVILLE RY V TAYLOR (RIGHT OF RAILROAD TO OBSTRUCT SURFACE DRAINAGE).
115 So 200-201 (Miss 1928).

Descriptors: *Mississippi, *Surface drainage, *Repulsion (Legal aspects), *Obstruction to flow, Riddance (Legal aspects), Surface waters, Surface runoff, Embankments, Drainage, Natural flow, Flow, Flooding, Railroads, Right-of-way, Civil engineering, Engineering structures, Condemnation, Legal aspects, Judicial decisions, Damages, Relative rights.

Plaintiff landowner sued defendant railroad company for damages suffered when the natural surface drainage of his land was blocked by an embankment which was built for defendant's railroad tracks. Defendant contended the jury was improperly instructed that there would be liability regardless of whether the railroad bed was constructed properly or improperly. The Supreme Court of Mississippi, in reversing a lower court verdict for plaintiff, held that the jury was instructed incorrectly. Whenever a railroad acquires a right-of-way for its track by purchase or condemnation, it also obtains exemption from liability to adjacent landowners for damages resulting from proper construction and maintenance of the track bed. A railroad, however, cannot build a track bed so as to obstruct surface waters if another equally conveneient and inexpensive method would not so obstruct the natural drainage. The court held that surface waters, subject to that exception, are a common enemy and may be repelled without liability. (Morris-Florida)

MONEY V WOOD (STATE SALE OF LAND UNDER NAVIGABLE WATERS).
118 So 357-360 (Miss 1928).

Descriptors: *Mississippi, *Ownership of beds, *Navigable waters, Legal aspects, Judicial decisions, Remedies, Public rights, State governments, Administrative agencies, Legislation, Shores, Beds under water, Lands, High water mark, Low water mark, Islands, Landfills, Navigation, Real property.

Plaintiff landowner sought an injunction to prevent defendant from erecting an artificial island, with hotels and houses thereon, in the Mississippi Sound in front of plaintiff's home. Defendant contended that he had valid title to the submerged land from the state land commission. The Supreme Court of Mississippi, in affirming the issuance of the injunction, declared that the title allegedly passed by the state was void. The land commissioner acted under a statute allowing sale of state-owned land, but the court ruled that the statute should be construed, if possible, to fit under the constitutional provision forbidding permanent obstruction of navigable waters. The court noted that lands between the high and low tide marks were to be held in trust for the people of the state and not sold for private use, though some states allow such sale. The court further construed the word 'land' to mean dry land rather than land under water so that the statute in question would not authorize the sale. (Morris-Florida)
W71-02561

HAVARD V STATE (RIGHT TO CONTROL OF BEDS UNDER WATER).
124 So 912-914 (Ala 1929).

Descriptors: *Alabama, *Prescriptive rights, *Ownership of beds, *Public rights, Bayous, Beds under water, Legal aspects, Judicial decisions, Remedies, Navigable waters, Bodies of water, Oysters, State governments, Riparian land, Riparian waters, Roads, Shores, Boundaries (Property), Access routes, Adjudication procedure.

Plaintiff, lessee of a landing on a bayou containing oyster beds, brought a trespass after warning action against defendant for use of the landing and water over the oyster beds. Defendant countered that plaintiff did not possess the areas in question, and therefore could not maintain the action. The Court of Appeals of Alabama, in reversing a verdict against defendant, held that the title to the beds and bottoms of all rivers, bayous, lakes and inlets rests in the state in trust for the people. The state could lease oyster beds, but it had not in the instant case, and thus plaintiff had no possessory claim. Since a warning against trespass could not be made for an area larger than the area the person giving the warning possessed, plaintiff's warning was of no effect. The court also indicated that the public had acquired a prescriptive right to use of the public road to the landing, and in such a case the ownership of the shore was subject to the public's right of access to the water's edge. The public had also acquired a prescriptive right to use of the landing. (Morris-Florida)

KILLGORE V COLE (LIABILITY FOR OBSTRUCTION TO FLOW OF STREAM).
126 So 861-862 (Ala 1930).

Descriptors: *Alabama, *Obstruction to flow, *Natural flow, *Riparian rights, Riddance (Legal aspects), Diversion, Remedies, Damages, Drainage, Streams, Surface waters, Dams, Impounded waters, Lakes, Fishing, Damsites, Channels, Flow, Ditches, Rainfall, Water levels, Surface runoff.

Plaintiff upper landowner brought suit to enjoin the maintenance of an alleged private nuisance created by obstruction of the natural flow of water by defendant lower landowner. Plaintiff's and defendant's lands were drained by a stream traversing their properties. Defendant built a dam upon the stream, thereby impounding the waters and creating a lake upon his property. Plaintiff alleged that the dam caused the stream to back up, eddy in the channel and overflow its banks in time of freshets, thereby causing improper drainage of plaintiff's lands. The Supreme Court of Alabama affirmed the lower court's decision for defendant. The court found that by successive lowerings of the dam and spillway, the body of the lake was withdrawn sufficiently, that the flow of water was unobstructed and that no substantial injury resulted to plaintiff as a result of maintenance of the dam. (Barnett-Florida)

CITY OF MOBILE V LARTIGUE (SERVIENT LAND MUST ACCEPT ONLY WATER FLOW-

ING NATURALLY THERETO FROM DOMINENT ESTATE).
127 So 257-261 (Ala 1930).

Descriptors: *Alabama, *Surface drainage, *Surface runoff, *Flow augmentation, Airports, Cities, Surface waters, Natural flow, Natural flow doctrine, Flooding, Floodwater, Ditches, Damages, Judicial decisions, Legal aspects, Topography, Overflow, Drainage, Drainage practices, Discharge (Water), Local governments.

Plaintiff landowner sought damages from defendant city for injury to plaintiff's property which resulted from the increased flow of surface water from defendant's dominant land to plaintiff's servient land. Such increased flow was caused by defendant's improvement of the natural drainage. Defendant contended any injuryresulting was noncompensable as defendant was operating within its governmental capacity. The court ruled that defendant had been operating in its corporate capacity and that defendant would therefore be governed by the same principles that govern private corporations. The servitude of a lower tenement to a dominent tenement, with reference to surface waters, extends only to surface waters flowing in their natural channels, and does not authorize the proprietor of the dominent tenement to collect the water into drains or artificial channels and precipitate it in increased quantity and volume onto the lower land to its injury. The trial court's judgment for plaintiff was affirmed. (Price-Florida)
W71-02564

PEOPLE V FOOTE (STATE OWNERSHIP OF BEDS).
242 App Div 162, 273 NYS 567-582 (1934).

Descriptors: *New York, *Ownership of beds, *Harbors, *State governments, Legal aspects, Judicial decisions, Boundary disputes, Public rights, Patents, Navigable waters, Governments, Reservation doctrine, Political aspects, Beds, Legislation, Real property, Beds under water.

Plaintiff people of New York sought a declaration of their rights to certain beds under a large bay as against defendant landowner. Plaintiff contended that while defendant's heir had established title from the Indians and the Dutch colonialists, his predecessor in title had applied for a confirmatory grant from the English colonial governor and thus divested himself of all title except that specifically identified in the confirmatory grant. Plaintiff thus contended that since the confirmatory grant did not include the beds in question, the beds passed to the colonial government and then to the state of New York. Defendant contended that his heir had established title from the Indians and the Dutch government and that this title had passed to him in an unbroken chain of title. The court held that: (1) a grant from a sovereign is strictly construed against the grantee; (2) a deed from Indians is not a legal source of title; (3) the application by defendant's predecessor for a confirmatory grant from the English colonial government constituted a surrender of all previous title to the government; and (4) the grantee took title only to the lands specifically described in the grant. (Price-Florida)
W71-02565

STATE V JEFFERSON ISLAND SALT MINING CO (DAMAGES FOR TRESPASS ON LAKE BEDS).
183 La 304, 163 So 145-170 (1935).

Descriptors: *Louisiana, *Lake beds, *Ownership of beds, *Mining, Navigable waters, Riparian rights, Leases, High water mark, Water levels, Mineralogy, Salts, Saline lakes, Rivers, Streams, Riparian land, Outlets, Public rights, Damages, Legal aspects, Judicial decisions, Land tenure, Marshes, Appropriation, Adjudication procedure.

Plaintiff state sought damages from defendant salt company for trespass onto state property. Defendant was lessee of land bordering a lake and had mined salt from the bed of the lake. Plaintiff alleged that title to the bed was in the state. Defendant's lessor intervened in the suit and alleged ownership of the bed to the center of the lake. Plaintiff contended that the intervenors were liable with defendant for the trespass. The trial court found for plaintiff, and the Supreme Court of Louisiana affirmed and amended. Disposition of the case depended on: (1) the navigability of the lake; (2) the legal consequences of navigability; (3) the ordinary high water mark of the lake; (4) the extent of the trespass; (5) the quantity of salt removed; (6) the good faith of defendant; and (7) the amount of damages. The court held that the lake was navigable because it was navigable at the time of the Louisiana Purchase. Title to beds of navigable waters is in the state. Ownership of beds extends from the mean high water mark, and the court ruled that the trial court had fixed this mark at too low a level. The court found that defendant's trespass was willful, and stated that the amount of damage for willful trespass of minerals is the value of the minerals taken. Finally, the court held that the lessors and lessee were jointly liable for the trespass. (Duss-Florida)
W71-02566

YOUNG V INTERNATIONAL PAPER CO (LIABILITY FOR DESTRUCTION OF GROWING TIMBER BY FLOODING).
179 La 803, 155 So 231-233 (1934).

Descriptors: *Louisiana, *Industrial water, *Prescriptive rights, *Flooding, Acidic water, Mills, Water pollution sources, Waste water (Pollution), Judicial decisions, Legal aspects, Lumber, Discharge (Water), Floods, Streams, Bayous, Swamps, Water rights, Water injury, Flood damage, Relative rights.

Plaintiff owned land which contained standing timber. However, the land was swampy and generally unfit for agriculture. Defendant operated two paper mills which discharged waste water into a creek. The creek entered a bayou which traversed plaintiff's land. Plaintiff's land was bowl shaped and largely flooded during the spring. Plaintiff brought an action for damages to his land and to his timber which he claimed was killed by defendant's waste water. Plaintiff claimed the land was constantly flooded due to defendant's discharges. Defendant contended that plaintiff had notice of timber damage prior to one year before filing suit and that such knowledge precluded recovery, because of prescription, under Louisiana law. The Supreme Court of Louisiana, in affirming the trial court's judgment for defendant, held that plaintiff's cause of action for destruction of growing timber by flooding had been prescribed. The court also held that plaintiff suffered no damage to his land since it was swampy and unfit for agriculture, and the gas prospects which gave the land chief value was not injured. (Powell-Florida)
W71-02567

LAW V GULF STATES STEEL CO (LIABILITY FOR OBSTRUCTION OF NATURAL FLOW OF EXCESS WATER IN STREAM).
156 So 835-841 (Ala 1934).

Descriptors: *Alabama, *Obstruction to flow, *Rainfall, *Impounded waters, Alteration of flow, Natural flow doctrine, Judicial decisions, Legal aspects, Diversion, Dams, Barriers, Reasonable use, Riparian rights, Rain, Floodwater, Floods, Impoundments, Flood damage, Water injury, Excessive precipitation, Damages.

Defendant corporation owned land abutting on a creek and erected a dam across such creek. Defendant, in connection with the dam, constructed a lateral wall on one side of the creek extending from the dam to a bridge located upstream from the dam. Plaintiff, who owned land upstream from the dam, had his crops destroyed by floodwater as a result of heavy rains. Plaintiff brought an action for damages, alleging that the damming and walling of the creek diverted water onto his land. Defendant contended that unusual and excessive rains which constituted an act of God caused the flooding. The Supreme Court of Alabama reversed the trial court's judgment for defendant. The court held that defendant was liable for obstructing the natural flow of excess water in the creek and causing injury to plaintiff's crops. The court stated that unusual and excessive rainfall was not a correct definition of an act of God. The court pointed out, however, that plaintiff would not have been able to recover if his damages would have occurred had the dam not existed. (Powell-Florida)
W71-02568

HILL V LOLLAR (LIABILITY OF SUBSEQUENT PURCHASERS UNDER WATER RIGHTS CONTRACTS).
157 So 870-872 (Ala 1934).

Descriptors: *Alabama, *Remedies, *Relative rights, *Water supply, Adjudication procedure, Land, Land tenure, Contracts, Artesian wells, Pipes, Water sources, Judicial decisions, Legal aspects, Water contracts.

Plaintiff sought to enjoin defendant from interfering with maintenance of a water pipe by which plaintiff obtained his domestic water supply. Defendant's predecessor had contracted with plaintiff for the installation of the pipe which drew water from an artesian well on defendant's land. Defendant, who had acquired his land through a mortgage foreclosure, claimed ownership as a bona fide purchaser without notice of the prior contract and therefore asserted that he was not bound by it. The trial court granted the injunction, but the Supreme Court of Alabama reversed, stating that if the relative positions of the parties in such an action are to be determined, the positions must be alleged in the original bill and answer. That not having been done, the trial court erred in taking testimony on irrelevant issues. The court further held that defendant's predecessors' agreement with plaintiff was ineffectual against a purchaser such as defendant who acquired title at a foreclosure sale. (Barker-Florida)
W71-02569

WESTERN UNION TEL CO V DAMPSKIBS AKTIESELSKABET MAI (LIABILITY FOR DAMAGE TO UNDERWATER CABLE).
176 La 1081, 147 So 354-357 (1933).

Descriptors: *Louisiana, *Navigation, *Communication, *Damages, Mississippi River, Navigable rivers, Anchors, Ships, Boats, Legislation, Permits, Remedies, Adjudication procedure, Legal aspects, Judicial decisions, Relative rights.

Plaintiff telegraph company brought an action against defendant steamship company for the alleged destruction of plaintiff's cable under the Mississippi River. Plaintiff alleged that defendant's ship had dropped its anchor and that the anchor was dragged, causing it to become entangled in and break the cable. Defendant claimed that its anchor had not been dragged to the position of the cable and therefore did not cause the damage. The trial court rendered a verdict for plaintiff. In reversing, the Supreme Court of Louisiana ruled that the evidence was insufficient to support the verdict. The court further ruled that the right to operate the submarine cable was subject to the paramount right of full, free navigation in the river. It was held that even if defendant's acts were the proximate cause of plaintiff's damages, there would be no liability if defendant was following reasonable navigational practices. (Barker-Florida)
W71-02570

CRESSON V LOUISVILLE AND N RR (LIABILITY FOR COLLECTION AND DISCHARGE OF DRAINAGE WATER IN EXCESSIVE VOLUME).
146 So 462-463 (Miss 1933).

escriptors: *Mississippi, *Drainage practices, *lood damage, *Ditches, Railroads, Right-of-way, ainage effects, Drainage systems, Drainage ter, Relative rights, Riparian rights, Drainage, olume, Excavation, Artificial watercourses, Rain-ll, Remedies, Judicial decisions, Adjudication ocedure, Legal aspects, Water injury, Overlying oprietor.

aintiff landowner brought an action against de-ndant railroad to recover for flood damage used by defendant's alleged collection and scharge of excess water onto plaintiff's land. De-ndant had created two excavation pits along its ght-of-way, and drainage from such pits caused a tural drainage ditch across plaintiff's land to erflow following rainfall. The trial court in-ucted the jury to return a verdict for defendant. reversing, the Supreme Court of Mississippi led that the question of whether defendant acted ongfully was determinable by the jury. The court rther ruled that even though an upper owner quires the right of drainage by prescription, such ght does not entitle the upper owner to collect rface waters and discharge them in excess of eir natural volume upon a lower owner's land. arker-Florida)

EABOARD ALL FLORIDA RY V UNDERHILL NJUNCTIVE RELIEF FOR FLOODING BY BSTRUCTION OF NATURAL DRAINAGE).
1 So 306-308 (Fla 1932).

escriptors: *Florida, *Embankments, *Obstruc-n to flow, *Flooding, Railroads, Right-of-way, pounded waters, Drainage, Subsurface waters, dicial decisions, Legal aspects, Crops, Drainage actices, Access routes, Diversion, Natural flow, ams, Riddance (Legal aspects), Repulsion (Legal pects), Damages, Surface runoff.

efendant railroad constructed an embankment on right-of-way near plaintiff's land which ob-ucted the natural drainage of water from plain-ff's lands. Such obstruction impounded the sur-ce waters and caused periodic flooding of plain-ff's lands, thereby rendering them useless for their rmal purpose. Plaintiff brought suit to enjoin ch impoundment and obstruction. The Supreme ourt of Florida affirmed the lower court's order verruling defendant's demurrer. A mandatory in-nction was issued against defendant to require it abate the condition which it created by its em-nkment so as to no longer obstruct the flow of rface waters. (Barnett-Florida)
71-02572

OLINGER V MURRAY (LIABILITY FOR EVEE WHICH OBSTRUCTED NATURAL LOW).
7 So 761-764 (La 1931).

escriptors: *Louisiana, *Levee, *Drainage, *Al-ration of flow, Highways, Judicial decisions, atural flow, Impounded waters, Rainfall, Legal spects, Relative rights, Bayous, Drainage prac-ces, Ditches, Flow, Administrative agencies, iversion, Bridges, Administration, Overlying roprietor.

laintiff brought suit to have defendants remove a evee which allegedly caused the flooding of his nds. The levee was constructed by defendants to revent the natural flow of waters from a gravel ublic highway across their lands. Plaintiff alleged hat such levee impeded the natural flow of the ater and caused it to be diverted from its natural ow and impounded on his land following heavy ains. Defendants denied the levee obstructed flow nd contended that a nearby canal, constructed by governmental authority, caused the flooding. In ffirming the lower court's judgment for plaintiff, he court stated that it was proper to improve one's nd but not in such a manner as to cause injury to is neighbor. Water must not be diverted from its atural course and concentrated so as to flow over he adjacent lands of a lower estate where it would not otherwise flow. The court also took notice of the fact that the lower court had found defendants could modify the construction of their levee to prevent such overflow. (Barnett-Florida)

THE M L C NO 10 (STATUTORY REGULATION OF WHARFAGE RATES).
10 F2d 699-705 (2d Cir 1926).

Descriptors: *New York, *Docks, *Rates, *Legislation, Contracts, Beds under water, Bulkhead line, Piers, Claims (Contracts), Judicial decisions, Legal aspects, Admiralty, Ships, Use rates.

Plaintiff wharf owner brought libel to collect wharfage from defendant vessels. Plaintiff's wharves were built upon land under water conveyed to him by the state; the grant implicitly authorized plaintiff to collect wharfage for use by the public. Defendants contended that although the rates plaintiff charged were reasonable, plaintiff could not exact more than the statutory rate fixed by the legislature. Plaintiff asserted that defendants used his wharves knowing his rate, and therefore a binding contract arose by offer and acceptance. The court held that plaintiff was a private wharf owner, and, like all private wharf owners who opened their facilities to the general public, was subject to the wharfage rates established by the legislature. The lower court's decision for plaintiff was reversed. (Hart-Florida)
W71-02574

UNITED STATES V F D GLEASON COAL CO (CRIMINAL PROSECUTION FOR DREDGING NAVIGABLE WATERS WITHOUT APPROVAL).
14 F2d 233-234 (ED Mich 1926).

Descriptors: *Michigan, *Legislation, *United States, *Dredging, Adjudication procedure, Judicial decisions, Legal aspects, Administrative agencies, Federal government, Regulation, Navigation, Alteration of flow.

Plaintiff United States prosecuted defendant coal company for dredging in navigable waters in violation of statute. On motion to quash the indictment, defendant asserted that the statute, which on its face prohibited all dredging without approval of the Secretary of War, only prohibited dredging which would alter the course of the waters. The court observed that Congress clearly intended to prohibit any dredging without approval, and denied defendant's motion. (Hart-Florida)
W71-02575

ANGOLA TRANSFER CO V TEXAS AND P RY (LIABILITY FOR DAMAGES FOR SHIP SUNK BY RAILROAD BRIDGE PROJECTION).
14 F2d 484-488 (ED La 1926).

Descriptors: *Ships, *Piers, *Bridge design, *BRIDGE CONSTRUCTION, Bridges, Administrative agencies, Bulkheads, Piles (Foundations), Railroads, Navigation, Rivers, Damages, Admiralty, Legal aspects, Judicial decisions, Navigable waters.

Plaintiff steamboat owner sued defendant railroad company for damages caused by the sinking of plaintiff's steamboat. Defendant's railroad bridge pier had a steel cap projection extending six inches over the edge of the pier. During a period of high water, this cap was submerged six inches. As plaintiff's vessel passed through the bridge, it struck this projection and sank. Plaintiff asserted that defendant was negligent in maintaining the projection without protection for vessels. Defendant contended that approval of the bridge specifications by the War Department relieved it of liability. Plaintiff pointed out, however, that the plans, which were conditionally approved, included a bulkhead to prevent vessels from striking the pier. This bulkhead was not built. The court observed that vessels have a paramount right to navigate the waterways, concluding that defendant had the burden of providing safe passage for vessels through the bridge. The court determined that an error by the War Department in approving the plans would not relieve defendant from responsibility. Defendant was held negligent in maintaining the projection, and a judgment for plaintiff was entered. (Hart-Florida)
W71-02576

UNITED STATES V PENNSYLVANIA SALT MFG CO (OWNERSHIP OF BED BENEATH DOCK AREA).
16 F2d 476-483 (ED Pa 1926).

Descriptors: *Pennsylvania, *Docks, *Ownership of beds, *Riparian rights, Beds under water, Riparian land, United States, Riparian waters, Navigation, Land tenure, Rates, Low water mark, High water mark, Construction, Bulkheads, Piers, Jetties, Judicial decisions, Legal aspects, Permits, Relative rights.

Plaintiff United States sought an injunction to restrain defendant salt manufacturer from using or charging wharfage for use of a pier. Defendant and plaintiff owned contiguous riparian land. Defendant constructed a pier along the river which extended past the low water mark. Plaintiff constructed a slip along its land, extending it onto defendant's land and into defendant's pier by agreement. Defendant then used the pier and slip, charging wharfage. Plaintiff contended that it owned all the land under the water in the slip, thereby acquiring the exclusive right to use the slip and defendant's wharf. The court found that the dispute involved land both above and below the low water mark. Noting that a riparian owner holds title to land above the low water mark and the state holds title to land below the low water mark, the court observed that the sole right of a non-landowner to land between high and low water marks is for navigation. Such right of navigation is considered a public easement. A riparian owner's construction in navigable waters beyond the low water mark does not thereby give such owner title to the riverbed. A riparian owner may build beyond the low water mark with the state's permission, and such construction is property but not land. Based on these rules, the court held that plaintiff was not entitled to the exclusive right to charge wharfage for use of the pier. (Hart-Florida)
W71-02577

STATE V UNION ELEC LIGHT AND POWER CO (FEDERAL SUPREMACY OVER NAVIGATION AND NAVIGABLE WATERS).
41 F2d 692-699 (CD Mo 1930).

Descriptors: *Missouri, *Dam construction, *Navigation, *Navigable waters, Permits, Dams, Judicial decisions, Legal aspects, Federal government, Federal jurisdiction, State jurisdiction, Eminent domain, Condemnation, Public health, Hydroelectric project licensing, Electric powerplants, Hydroelectric plants, Reservoirs, Submergence, Public lands, Legislation, Administrative agencies, Cities.

Plaintiff state sought to enjoin the construction of a dam by defendant power company. Defendant intended to construct the dam pursuant to authorization by the Federal Water Power Act. Plaintiff contended such construction would: (1) impede navigation; (2) inundate large tracts of public and private land, school districts and highways; (3) create conditions deleterious to public health; and (4) benefit private, not public interests. Defendant contended the dam would aid and benefit navigation. The court stated that Congress has complete jurisdiction over all matters affecting navigation and complete dominion over the navigable waters of the United States under the commerce clause. The court ruled that the dam would aid navigation, that the federal government was supreme in this area, that Congress and not the courts decides on

the necessity for such projects and that the requirements of the Federal Water Power Act had been met. Plaintiff's complaint was dismissed. (Price-Florida)
W71-02578

COHOES POWER AND LIGHT CORP V STATE (CORPORATION'S RIGHT TO CONSTRUCT DAM SUBORDINATE TO STATE'S RIGHT TO IMPROVE NAVIGATION).
128 Misc 130, 217 NYS 839-846 (1926).

Descriptors: *New York, *Reservation doctrine, *Legislation, *Dam construction, State governments, Administration, Judicial decisions, Legal aspects, Water resources development, Dams, Navigable rivers, Navigable waters, Water policy, Prior appropriation, Riparian rights.

Legislation which incorporated plaintiff power corporation and authorized erection of a dam reserved right in defendant state to improve river navigation. Subsequent legislation which authorized plaintiff to erect another dam lacked the river improvement provision. Nineteen years later, defendant state constructed a dam above the dam which plaintiff had erected pursuant to its incorporation act. Defendant also appropriated part of plaintiff's land for canal uses. Plaintiff sought to recover for the value of lands appropriated and for other damages. Plaintiff claimed the destruction of its right to construct another dam pursuant to the second legislation and that the destruction of the right reduced the value of its property. Defendant contended that the reservation in the incorporating act was still in effect and therefore plaintiff had no valid claim except for compensation of lands appropriated. The New York Court of Claims held the legislation authorizing plaintiff to erect another dam was subordinate to defendant's right to improve navigation. The court also stated that failure of plaintiff to construct the authorized dam for nineteen years was sufficient ground for revocation and forfeiture of the right. (Powell-Florida)
W71-02579

EMPIRE STATE RR V STATE (STATE'S RIGHT TO IMPROVE NAVIGABLE STREAM).
133 Misc 6, 231 NYS 36-42 (1928).

Descriptors: *New York, *Navigable rivers, *Water levels, *Flood damage, Damages, Railroads, Navigation, Navigable waters, Dams, Flow, Overflow, Rainfall, Snowmelt, Snow, Precipitation, Administrative agencies, Judicial decisions, Legal aspects, Riparian land, Riparian rights, Channels, Construction, Public benefits, Channel improvement.

Plaintiff railway corporation instituted a claim against the state of New York for money it expended to raise its roadbed along a lake so as to avoid an allegedly higher lake level. Plaintiff alleged that the state had raised the water level of the lake by increasing the height of a dam and retarding the flow of water. The court dismissed the claim. The state has the right to widen, deepen and improve the channel of a navigable stream for the benefit of the public and to facilitate navigation. Riparian ownership is subject to the obligation to suffer the consequences thereof. The state has no liability to injured riparians in the absence of wanton injury, carelessness, negligence or illegality in performance. Defendant's raising of the dam was a part of a general enterprise to improve navigation on the navigable waters in the area. Nothing in the evidence indicated that defendant performed its work negligently or raised the water levels of the lake. The flooding of plaintiff's roadbed was temporary and caused by conditions outside the river channel, namely excess precipitation and accumulated snow. (Duss-Florida)
W71-02580

LITTLE FALLS FIBRE CO V HENRY FORD AND SONS (LIABILITY FOR MAINTAINING FLASHBOARDS FOR PRIVATE BENEFIT ON A FEDERAL DAM).
223 App Div 559, 229 NYS 445-451 (1928).

Descriptors: *New York, *Riparian water loss, *Navigable waters, *Dams, Eminent domain, Canals, Powerplants, Rivers, Water loss, Judicial decisions, Legal aspects, Federal government, Water rights, Water law, Riparian rights, Riparian land, Riparian waters, Public benefits, Competing uses, Relative rights, Remedies.

Plaintiff's manufacturing plants were located on a river branch. Water, impounded by plaintiff's dam across the branch, flowed through a canal to the plants and furnished power. Defendant, licensed by the federal government under the Federal Water Power Act, installed flashboards on a federal dam across the river in connection with its powerplant. Defendant's actions caused a rise in the canal water level and a reduction of plaintiff's water power. Plaintiff brought an action for damages and an injunction. Plaintiff alleged that his property had been taken without just compensation. Defendant claimed that the government authorization was an act in aid of navigation and not subject to judicial review. The court held that plaintiff was entitled to damages and a permanent injunction restraining defendant licensee from maintaining flashboards for private benefit on a federal dam. The court stated, however, that defendant's actions were not a taking of land under navigable waters, to which federal authorities had complete control. The court opined that congressional determination that use is public use is final, but the nature of use, whether public or private, is a judicial question. (Powell-Florida)
W71-02581

VAN CORTLANDT V NEW YORK CENT RR (BRIDGE CONSTRUCTION OVER NAVIGABLE WATERS).
139 Misc 892, 250 NYS 298-315 (1931).

Descriptors: *New York, *Navigation, *Navigable waters, *Bridge construction, Bridges, Railroads, Legislation, Legal aspects, Judicial decisions, Rivers, Dams, Navigable rivers, Non-navigable waters, Public rights, Harbors, Ships, Transportation, Structures, State governments, Adjudication procedure, Bridge design.

Defendant railroad erected a rigid bridge to replace a drawbridge across a river. The river was formerly navigable, but became navigable only by small boats when the state constructed a dam upstream. Plaintiff landowner sought an injunction to force the replacement of the bridge. Plaintiff claimed that the existence of the bridge impeded navigation and decreased the value of his adjacent property. Plaintiff contended that defendant's bridge, which was too low for passage of large vessels, was a public nuisance and violated a statute requiring drawbridges over navigable waters. The court dismissed the complaint. The statute in question required drawbridges only over waters generally navigable in fact. The past existence of commerce on a watercourse does not establish the present navigability in the presence of altered circumstances. The river's navigability by small boats did not establish its navigability for commerce as the term 'navigable waters of the United States' has reference to commerce of a substantial and permanent character. (Dye-Florida)
W71-02582

PEOPLE V BRENNAN (RIGHTS OF PUBLIC IN FORESHORE).
142 Misc 225, 255 NYS 331-336 (1931).

Descriptors: *New York, *Local governments, *High water mark, *Public rights, Low water mark, Recreation, Legal aspects, Judicial decisions, Navigable waters, Fishing, Baits, Water utilization, Sport fishing, Recreation demand.

Appellant fisherman was prosecuted by appellee village for the violation of a village ordinance prohibiting persons from digging bait from the foreshore of the village's beaches without first obtaining a license. Appellant contended that the rights of the public extended to digging bait from the foreshore for use in recreational fishing. Appellee contended that the public's rights were limited to fishing, bathing, and navigation and in no way extended to the digging of bait which had at times resulted in the undermining of the sea walls. The court, in affirming appellant's conviction, held that public rights in the foreshore included only passing, fishing, bathing, hunting and navigation. (Quesada-Florida)
W71-02583

RANSOM V SHAEFFER (TITLE TO LAND BETWEEN HIGH AND LOW WATER MARKS).
153 Misc 199, 274 NYS 570-574 (S Ct 1934).

Descriptors: *New York, *Lakes, *Tidal waters, *Low water mark, High water mark, Tides, Tidal effects, Remedies, Legal aspects, Judicial decisions, Lake Ontario, Lake shores, Water levels, Water level fluctuations, Real property, Contracts, Boundaries (Property).

Plaintiff vendor sought specific performance of a contract for the sale of beach property abutting on a non-tidal lake against defendant vendee. Plaintiff contended that the contract called for the conveyance of his interest in the property and that he conveyed all that he owned. Defendant contended that the contract was void in that he had sought to purchase the land to the low water mark. Defendant contended that plaintiff could only convey to the high water mark because grants of land bounded by tidal waters carry legal title only to the high water mark. Granting an order for specific performance, the court held that Lake Ontario was a non-tidal lake. A grant to land bounded by a non-tidal lake conveys legal title to the low water mark, so plaintiff was able to convey that which he contracted to convey. (Quesada-Florida)
W71-02584

PEOPLE EX REL HUDSON RIVER CONNECTING RR V STATE TAX COMM'N (STATE TAXATION OF BRIDGE OVER NAVIGABLE WATERS).
245 App Div 229, 281 NYS 358-361 (1935).

Descriptors: *New York, *Navigable waters, *Taxes, *Bridges, Ownership of beds, Streambeds, Government supports, Financing, Local governments, State governments, Legal aspects, Judicial decisions, Legislation, Navigation, Non-navigable waters, Assessments, Federal government.

Relator railroad corporation sought to have defendant tax commission's assessment of its bridge reviewed. Relator contended that its bridge was built by authority of Congress and the state was without power to levy a tax upon a franchise from the United States government. Maintaining that the stream which ran under its bridge was non-navigable, relator contended that the bridge was built upon its privately-owned streambed and thus could not be taxed as a special franchise. Defendant contended that Congress' power over navigable waters was limited to matters of navigability and obstruction. Therefore the state could tax such structures because, by granting permission to build the bridge, Congress had waived all prohibitions over the structure. The court held that Congress' power over navigable water was limited to those things necessary to regulate commerce and navigation, and thus the bridge was taxable by the state as a special franchise. The court also found that the stream was navigable, and therefore relator did not own the streambed. (Quesada-Florida)
W71-02585

MASSACHUSETTS V NEW YORK (RESERVATION, IN INTERSTATE TREATY, OF

VEREIGNTY TITLE TO LANDS UNDER VIGABLE WATERS).
1 US 65, 46 S Ct 357-363 (1926).

scriptors: *Lake Ontario, *Accretion (Legal ects), *Ownership of beds, *Boundary disputes, w York, Massachusetts, Lakes, Lake beds, undaries (Property), Treaties, Legislation, State vernments, Land tenure, Legal aspects, Judicial isions, Navigable waters, Lake shores, High ter mark, Low water mark, Prescriptive rights.

intiff Massachusetts sued defendant New York quiet title to land formed by accretions to the reline of Lake Ontario. By the Treaty of Hartd, New York had granted to Massachusetts vate ownership of certain lands bounded by the re of the lake, but had reserved all rights of ereignty and jurisdiction. Massachusetts conded that the grant included the lake bed and, alnatively, that the grant included the shore to the water mark, whereby Massachusetts would be itled to the accretions. New York argued that nership of the beds of navigable waters was a ht of sovereignty and therefore reserved to New rk by the Treaty. New York also argued that ssachusetts owned only to the high water mark d, therefore, was not entitled to the accretion. e United States Supreme Court noted that vereign dominion over navigable waters can only divested by express grant, which did not appear the Treaty, or by prescription, which was cluded by the Treaty and by Massachusetts' acts acquiescence in New York's sovereignty. The urt held that title was in New York. (Liptak-rida)

CCORMICK V CHICAGO YACHT CLUB IGHT TO NON-RIPARIAN EASEMENT OF EW ACROSS PUBLIC PARK).
1 Ill 514, 163 NE 418-421 (1928).

scriptors: *Illinois, *Riparian rights, *Easeents, *Parks, Real property, Land tenure, Riparian land, Riparian waters, Lakes, Lake Michigan, ke shores, Right-of-way, Access routes, Docks, ating, Marinas, Recreation facilities, Cities, cal governments, Bulkhead lines, Landfills, ildings, Legal aspects, Judicial decisions, Adjucation procedure, Remedies.
entifiers: Injunction (Prohibitory).

aintiffs owned land abutting the city's waterfront rk. By prior judicial decision, the city held the rk in trust for the public and could not erect any ildings thereon without the consent of the utting landowners. The landowners' rights ounted to easements. The city authorized defennt yacht club to erect a clubhouse and docks on ndfill adjacent to the park. Plaintiffs sued to strain defendant from obstructing their easement view across the park and access to Lake ichigan. Defendant cross-claimed to quiet title to e landfill and to enjoin plaintiffs from bringing y further actions. The court affirmed the dgment dismissing plaintiffs' complaint, holding at plaintiffs were not riparian owners and had no sements of view or access and that defendant's ubhouse did not violate the public trust since it as not on land within the park's original boundaes. However, the court reversed the judgment ieting defendant's title, stating that equity will t act to remove a mere verbal or oral claim ainst property since only written instruments on cord can be considered as clouds on a title. (Lipk-Florida)
71-02587

UPUE ROD AND GUN CLUB V MARLIERE ALIDITY OF TITLE TO LAKE BED OBAINED THROUGH SWAMP LANDS ACT).

32 Ill 322, 163 NE 683-685 (1928).

escriptors: *Illinois, *Lakes, *Swamps, *Ownerip of beds, Beds, Lake beds, Navigable waters, Real property, Land tenure, Recreation, Hunting, Sport fishing, Legal aspects, Judicial decisions, Administrative decisions, Ajudication procedure, United States, State governments, Legislation.
Identifiers: *Swamp Lands Act.

Plaintiff hunting and fishing club sued to enjoin defendants from trespassing on club property to hunt and fish. Plaintiff contended that it had acquired part of the land and the bed of a lake from the state of Illinois, which had allegedly obtained the submerged property from the United States pursuant to the Swamp Lands Act. Defendants contended that plaintiff's title was void since the lake was navigable in fact when Illinois was admitted to the Union. Therefore, title passed to the state at that time rather than by the Swamp Lands Act. The court held that the Secretary of the Interior's listing of the lake as swampland under delegated authority from Congress was conclusive except for a direct attack for fraud or mistake. The listing was not open to collateral attack in this trespass proceeding. The court reversed a judgment dismissing that part of plaintiff's claim applicable to the lake bed. (Liptak-Florida)
W71-02588

IN RE PUBLIC BEACH IN CITY OF NEW YORK (TITLE TO AND CONDEMNATION VALUE OF FORESHORE AND OCEAN BOTTOM).

256 NY 156, 176 NE 5 (1931).

Descriptors: *New York, *Low water mark, *Ownership of beds, *Beaches, Atlantic Ocean, Eminent domain, Condemnation, Condemnation value, Compensation, Legal aspects, Judicial decisions, Oceans, Navigable waters, Boundaries (Property), Tidal waters, Shores, Cities.

The City of New York brought eminent domain proceedings to acquire land for a public beach. The city claimed title to the foreshore, the land between the high and low water marks, through a colonial grant of land bounded by the 'main ocean'. The city also claimed that the property owners were only entitled to nominal damages for a taking of the foreshore and the land below the low water mark. The court held per curiam that the city's grant of land to the 'main ocean' only conveyed title to the high water mark and that the property owners were entitled to recover the full value of the foreshore and the land below the low water mark. (Liptak-Florida)
W71-02589

MAYO V NEW YORK CENT RR (OWNERSHIP OF LAND UNDER BAYS).
263 NY 277, 189 NE 217-219 (1934).

Descriptors: *New York, *Bays, *Ownership of beds, *Boundaries (Property), High water mark, Boundary disputes, Grants, Bodies of water, Land, Real property, Oceans, Rivers, Legal aspects, Judicial decisions, Beds, Beds under water, River beds, Channels, Hudson River, Harbors, Navigable waters.

Plaintiff claimed title to land under water in the Hudson River as successor in title to a colonial patent which included land beneath the surface of coves and bays of the river. Defendant railroad contended that the waters beneath which the land lay were not bays and that plaintiff's property stopped at the high water mark. The Court of Appeals of New York affirmed judgments for plaintiff as to parcels of land found to lie in actual bays or coves. Judgment was reversed as to one parcel lying beneath an alleged bay with headlands more than 5 miles apart. Where a true bay is found, its depth and width are many times greater than the distance between headlands. In the instant case, the court found the body of water to be a bend in the river only, with a distance between headlands so great that the receding shore was washed by the tides without hindrance. There was no true sheltered harbor, and the waters were part of the river. (Dye-Florida)
W71-02590

NIAGARA FALLS POWER CO V WATER POWER AND CONTROL COMM'N (POWER OF STATE TO REGULATE DIVERSION OF NAVIGABLE WATERS).
267 NY 265, 196 NE 51-57 (1935).

Descriptors: *New York, *Diversion, *State jurisdiction, *Federal jurisdiction, State governments, Federal government, Administration, Legal aspects, Electric power, Judicial decisions, Rivers, Navigable waters, United States, Electric power production, Dams, Electric power industry, Public utilities, Running waters, Interstate rivers, Navigation, Navigable rivers, River flow, Treaties.

Plaintiff power company sought to avoid a rental charge by defendant state on water drawn from the Niagara River for use in plaintiff's power plant. A federal treaty allowed diversion of up to 20,000 cubic feet per second. A state law allowed diversion of 15,100 cubic feet per second without charge, with a reasonable rental to be charged for diversions exceeding this amount. Plaintiff contended that the federal treaty was binding on the state and that plaintiff was entitled to divert without charge up to the federal limit. The Court of Appeals of New York reversed an order for plaintiff. The federal government's control over navigable interstate waterways is unquestioned, but is exercised in conjunction with the states. The Niagara River, being navigable in part, is navigable as a whole and is thus under the control of the state within the limits set by Congress. The limit on diversion established by treaty did not affect the right of the state to charge a reasonable rental for diversion. Previous grants by the state to plaintiff were always subject to the state's power to regulate. (Dye-Florida)
W71-02591

CLEVELAND, C C AND ST L RY V MUMFORD (CONSTRUCTION OF LEVEES).
197 NE 826-837 (Ind 1935).

Descriptors: *Indiana, *Flood control, *Levees, *Assessments, Costs, Embankments, Rivers, Navigable waters, Navigable rivers, Railroads, Surface waters, State governments, Federal government, Legal aspects, Judicial decisions, Dikes, Flood protection, Bridges, Structures, Construction costs, Damages, Eminent domain, Benefits, Cost allocation.

Defendant railroads and landowners opposed plaintiff commissioners' petition to construct levees. Defendants contended that: (1) a federal act prohibited obstructions in navigable rivers; (2) defendant railroads were damaged by being forced to reconstruct their tracks to conform to the levees; and (3) defendant railroads should not be assessed for construction of levees which were of no benefit to them. The Supreme Court of Indiana reversed a judgment for plaintiff commissioners, finding that defendants' third ground of argument was valid. The federal act prohibiting obstruction of navigable streams did not extend to structures constructed outside the natural course of a stream but within its limits at its highest overflow. Also, railroads are required, as a condition to their franchise, to alter their facilities to conform to new structures by the state. However, for the purpose of assessment, the cost of such alterations is to be subtracted from any benefits accruing to railroads. The case was reversed for new findings as to benefit and assessment. (Dye-Florida)
W71-02592

POWELL V PORTER (PUBLIC NATURE OF ROAD BUILT ALONG BANK OF A NAVIGABLE RIVER).
172 La 681, 135 So 24-26 (1931).

Descriptors: *Roads, *Banks, *Navigable rivers, *Louisiana, Roadbanks, Rivers, Navigable waters, Riparian land, Judicial decisions, Legislation, Relative rights, Legal aspects, Public lands, Public benefits, Riparian waters, Public rights.

Plaintiffs brought a suit to enjoin defendants from using a road which crossed a corner of plaintiffs' land and led to defendants' land. Plaintiffs contended that the road, which ran along the bank of a river transversing the lands involved, was a private road. Defendants contended that the road was a public one in that the road had been used by the public for over 60 years. The court held that the road was a public road. The court based its decision on a statute which provided that all roads constructed on the borders or banks of navigable rivers were to be deemed public roads. The court held that the road in question, having been constructed by plaintiff riparian proprietors along a navigable river, was a public road, and defendants had a right to use such road. (Snow-Florida)

WILLIAMS V GUTHRIE (STATE OWNERSHIP OF BEDS OFF COASTAL WATERS AS REASON FOR DENYING PRIVATE REPLEVIN ACTION FOR RECOVERY OF A PIER).
137 So 682-686 (Fla 1931).

Descriptors: *Florida, *Ownership of beds, *Coasts, *Piers, Beds, Beds under water, Bays, Littoral, Riparian land, Judicial decisions, Docks, Coastal structures, Relative rights, Legal aspects, Shores, Land tenure, Navigable waters, Remedies.

Plaintiff brought action in ejectment against defendant for recovery of possession of a pier. The pier was constructed upon the submerged lands of a coastal bay. Plaintiff contended that he had been deeded the land adjacent to the submerged land and that his ownership of the coastal land extended into the bay and included the submerged land. Defendant, as heir of plaintiff's grantor, contended that the deed of the upland did not include the submerged land, and thus the ownership of the pier never passed to plaintiff. The court held that the state owned the land submerged under navigable waters. The pier was thus an encroachment upon the property right held by the sovereign. A private party could not by ejectment recover possession of such lands under navigable waters, such lands being owned by the state. Plaintiff's action for ejectment was dismissed. (Snow-Florida)
W71-02594

ROUSE V SAUCIER'S HEIRS (NATURE OF STATE'S OWNERSHIP OF TIDAL MARSHES OF NAVIGABLE RIVERS).
146 So 291-292 (Miss 1933).

Descriptors: *Land tenure, *Tidal marshes, *Mississippi, *Ownership of beds, High water mark, Low water mark, Relative rights, Tides, Marshes, Wetlands, Salt marshes, Tidal waters, Rivers, Navigable rivers, Navigable waters, Judicial decisions, Boundaries (Property), Public rights, Legal aspects, Public benefits, Public lands.

Plaintiff brought an action to cancel claims by defendants to certain tidewater lands. Plaintiff contended that he was the owner of certain tidewater marshes between the high water and low water marks of a navigable river. Plaintiff contended that he had received a grant of land adjacent to the river and that such grant extended to the low water mark. Defendants contended that they had been granted these lands under tidewater by a patent from the state of Mississippi. The court held that the state of Mississippi held lands under tidewater as trustee for the public. Such land is held for public purpose, including commerce and navigation, and the state cannot convey such lands to private owners for private purposes. The court thus held that the state of Mississippi could not have granted the lands in dispute to defendants. The court did not establish what interest plaintiff had in the lands, but held that he had sufficient interest to cancel the claims of defendants. (Snow-Florida)
W71-02595

PERKY PROPERTIES INC V FELTON (PRIVATE RIGHTS IN PUBLIC LANDS).
151 So 892-895 (Fla 1934).

Descriptors: *Florida, *Beds under water, *Ownership of beds, *Aquatic life, Relative rights, Littoral, Legislation, Judicial decisions, Oceans, Shores, Coasts, Gulf of Mexico, Aquatic habitats, Riparian land, Navigable waters, Public rights, Land tenure, Tidal waters.

Plaintiff corporation sought an injunction against defendants to protect its rights to propagate sponges in tidal submerged waters on the Gulf Coast of Florida. Plaintiff contended that the legislature had granted to persons owning certain described lands bordering upon the waters of the state the right to grow and propagate sponges in the waters adjacent to the shoreline. Therefore plaintiff contended that defendants were precluded from disturbing such area. Defendants contended that tidal and submerged lands of the state are held in trust for all the people of the state and therefore defendants had the right to be in such area. The court held that the state could grant private rights in such lands for the use of private individuals to grow and propagate sponges, and reversed the trial court's denial of plaintiff's injunction. (Snow-Florida)
W71-02596

LOUISVILLE AND N RR V O'FLYNN (LIABILITY FOR CROP DAMAGE CAUSED BY OVERFLOW OF DRAINAGE DITCHES).
213 Ky 346, 281 SW 174-176 (1926).

Descriptors: *Kentucky, *Ditches, *Drainage water, *Water injury, Flooding, Railroads, Embankments, Drains, Culverts, Surface runoff, Flood damage, Crop response, Surface waters, Contracts, Claims (Contracts), Legal aspects, Judicial decisions, Adjudication procedure, Overflow.

Plaintiff farmer brought action against defendant railroad for damages to his land and crops caused by the overflow of drainage ditches along defendant's roadbed. Plaintiff and defendant had settled a prior similar action and, as part of the settlement, defendant agreed to construct and maintain specified drainage ditches. Plaintiff contended that defendant failed to construct and maintain the ditches in accordance with the prior settlement, resulting in the flooding of plaintiff's land and destruction of his crops. Defendant contended that the ditches were built and maintained as specified, that plaintiff was contributorily negligent and that plaintiff could not recover for his crop losses sinch his action sounded in contract, not in tort. Affirming a judgment for plaintiff, the court held that the evidence and the law were properly submitted to the jury. The court also noted that the issues were clearly presented, even though the action was a mixed contract and tort nature, since plaintiff sought only temporary damages to his crops and not permanent damages to his land. (Liptak-Florida)
W71-02597

PENNSYLVANIA RR V ERIE RR (NAVIGABLE WATER WITHIN BULKHEAD LINES).
40 F2d 420-422 (2d Cir 1930).

Descriptors: *New York, *Navigable waters, *Navigation, *Bulkhead line, Bulkheads, Legal aspects, Judicial decisions, Railroads, Fog, Piers, Floats, Damages, Admiralty, Adjudication procedure, Ships.

Libel was brought by plaintiff railroad company against defendant ferryboat and defendant railroad company for damage done to plaintiff's car float by defendant ferryboat. Defendant ferryboat lost its bearing and rammed plaintiff's float during heavy fog. Plaintiff contended that defendant was at sole fault. Defendant contended that plaintiff was also at fault. The court found that plaintiff's float, the last of six moored at the end of a pier, had a duty to make its presence known during fog. The fact that plaintiff was within the bulkhead line was deemed irrelevant as waters within that line are as open to navigation as any others until occupied by piers. The judgment for plaintiff as modified was affirmed. (Price-Florida)

BEST RENTING CO V CITY OF NEW YORK (TITLE TO LAND UNDER WATER).
221 App Div 707, 225 NYS 66-68 (1927).

Descriptors: *New York, *Land tenure, *Grants, *Boundaries (Property), Boundary disputes, Land, Real property, Low water mark, Adjudication procedure, Legislation, Judicial decisions, Legal aspects, Oceans, Navigable waters, Marshes, Tidal marshes, Tidal waters, Beds under water.

Plaintiff company and defendant city both claimed title to a certain tract of upland and accompanying land under water. Plaintiff claimed title under an early grant. Defendant contended that plaintiff's grant did not prove title to the hassock and ground under water which was north of the upland. The Supreme Court of New York affirmed a judgment for plaintiff. Plaintiff made out its case by producing evidence of a prior acquired title. The burden was then on defendant to prove better title, in this case under a legislative act. Plaintiff's grant of title to the upland, bounded by the low water mark, was held to include hassocks and marshes to the low water mark. (Dye-Florida)
W71-02599

SCHIFFERDECKER V BUSCH (TITLE TO LANDS UNDER WATER).
130 Misc 625, 225 NYS 106-112 (1927).

Descriptors: *New York, *Contracts, *Land tenure, *Ownership of beds, Rivers, Land, Real property, Judicial decisions, Legal aspects, Easements, Right-of-way, Water supply, Hudson River, Beds, Beds under water, River beds, Streambeds.

Plaintiff sought to enforce a contract between himself as vendor and defendant as vendee of a piece of property. Defendant contended that plaintiff had not fulfilled his bargain to convey the property unencumbered since there was a water pipe easement across one lot to supply water to the remaining property and that the deed proffered did not convey the land under water adjacent to the property. The Supreme Court of New York held for plaintiff. The water pipe easement no longer existed since plaintiff owned all the property involved and therefore such rights were merged in him. The owner of upland property owns land under water in the Hudson River, thus plaintiff's conveyance of the upland conveyed the adjacent riverbed. (Dye-Florida)
W71-02600

NEW YORK V ILLINOIS (DIVERSION OF WATER FROM INTERNATIONAL WATER COURSES).
274 US 488, 47 S Ct 661 (1927).

Descriptors: *New York, *Illinois, *Lake Michigan, *Diversion, Adjudication procedure, Rivers, Navigable rivers, Riparian rights, International waters, Foreign waters, Lakes, Judicial decisions, Legal aspects, Relative rights, State governments, Water supply, Watercourses (Legal).

Plaintiff New York sought an injunction to restrain defendant Illinois from diverting water from Lake Michigan. Defendant moved to strike a paragraph of the complaint which asserted that the diversion might interfere with plaintiff's use of the Niagara and St. Lawrence rivers for power development. The Court noted that the rivers were international

ereby requiring the consent of Canada and the ited States for diversion of such water. Holding t plaintiff's contention did not assert an actual threatened injury, but only raised an abstract estion, the Court sustained defendant's motion. art-Florida)

X RIVER PAPER CO V RAILROAD OMM'N (CONSTITUTIONALITY OF ATUTE REQUIRING DAM OWNERS TO ONSENT TO STATE PURCHASE OF DAM).
4 US 651, 47 S Ct 669-671 (1927).

scriptors: *Wisconsin, *Dams, *Permits, iparian rights, Legislation, Administrative agens, State governments, Administrative decisions, vers, Navigable rivers, Beds under water, Navigan, Ownership of beds, Payment, Compensation, pervisory control (Power), Regulation, Operan and maintenance.

aintiff paper company sought a writ of mandamus compel defendant commission to act upon its apcation to maintain its dam. Plaintiff maintained dam without a permit. State statute required m owners to consent to allow the state to acquire eir dams after 30 years for a preformulated ount as a condition to receiving a permit. Plainf filed for a permit to maintain its dam, but defennt refused to consider the petition for want of judiction since plaintiff had not filed the consent. aintiff asserted that the statute violated the fourenth amendment as a taking without due process. aintiff asserted that under state law the riparian vner held title to the bed of navigable rivers, and erefore it had the right to erect a dam and use ater power. Defendant contended that plaintiff's ght to use water power was subordinate to the ate's control of navigable waters. Finding that aintiff had no property right under state law to e water power, the court held that the statute was nsistent with the fourteenth amendment. The urt stated that while a state may give riparians ghts over navigable rivers, such rights are subject the public rights of navigation, fishing and the tablishment of a public water supply. (Hartorida)

ENRY FORD AND SON, INC V LITTLE ALLS FIBRE CO (LIABILITY FOR LOSS OF ATER HEAD CAUSED BY FLASHBOARDS N DOWNSTREAM DAM).
80 US 369, 50 S Ct 140-142 (1930).

escriptors: *Federal Power Act, *Dams, *Hudson iver, *Head loss, River, Navigation, Navigable vers, Legislation, Damages, United States, ederal-state water rights conflicts, Hydroelectric ants, Hydroelectric project licensing, Federal overnment, Judicial decisions, Legal aspects, elative rights.

aintiff riparian owner sought to enjoin defendant deral licensee from placing flashboards on a deral dam which decreased plaintiff's water head. efendant was licensed to use surplus water from e federal dam to generate electricity for private se. The flashboards raised the pool two feet, ecreasing the head of plaintiff's upriver dam comensurately. Defendant asserted that the federal uthority to regulate navigation rendered it imune as a federal agent and that there was no takg of plaintiff's property. Plaintiff asserted that the ashboards were not authorized by the Water ower Act and that their use constituted a fifth mendment taking. Rejecting the contentions of oth parties, the Court observed that the Water ower Act provided that licensees should be liable or damages occasioned by licensed projects, and rohibited interference with state law in water apropriation and control. In affirming, the court eld that these provisions supported the lower ourt's award of damages and an injunction to laintiff. (Hart-Florida)
V71-02612

WISCONSIN V ILLINOIS (INJUNCTION STAYING DIVERSION OF WATER FROM LAKE MICHIGAN).
281 US 179, 50 S Ct 266-268 (1930).

Descriptors: *Illinois, *Lake Michigan, *Sewage, *Diversion, Wisconsin, Missouri, New York, Rivers, Navigable rivers, Navigable waters, Lakes, Riparian rights, Sewage treatment, Water pollution, Alteration of flow, Relative rights, Judicial decisions, Legal aspects, State governments, Water quality.

Plaintiff Wisconsin obtained an injunction against defendant Illinois preventing diversion of water from Lake Michigan for dilution and conveyance of Chicago's sewage. The case was referred to a master to determine the measures and time necessary to effect the decree. In reviewing both parties' exceptions to the master's report, the Court stated that: (1) the rise in Lake Michigan should not have been considered in determining the diversion reduction; (2) the possibility of future congressional action did not affect the prior decree; (3) the Chicago River did not have to be returned to its original direction of flow; and (4) the diverted waters should not be returned to Lake Michigan after purification. Retaining jurisdiction of the dispute, the Court entered a decree in accordance with the master's report, enjoining diversions exceeding stated amounts in such report. (Hart-Florida)
W71-02613

CONNECTICUT V MASSACHUSETTS (STATE'S DIVERSION OF INTERSTATE RIVER FOR MUNICIPAL WATER SUPPLY).
282 US 660, 51 S Ct 286-291 (1931).

Descriptors: *Interstate rivers, *Diversion, *Water utilization, *Reasonable use, State governments, Connecticut, Massachusetts, Natural flow doctrine, Prior appropriation, Relative rights, Riparian rights, Diversion structures, Dams, Reservoirs, Water policy, Water supply, Water rights, Judicial decisions, Legal aspects, Legislation, Domestic water, State jurisdiction, Damages, Water pollution.

Plaintiff Connecticut sued to restrain defendant Massachusetts from diverting water from an interstate river to supply drinking water for the city of Boston. Plaintiff contended that the diversion would interfere with plaintiff's reasonable use, would cause property damage and would interfere with a proposed hydroelectric plant. Plaintiff also contended that the diversion violated the law of riparian use in both states. Defendant contended that the diversion was necessary, reasonable and authorized by the War Department and the Massachusetts legislature. Defendant further argued that the only other source of water for the city was polluted, and its use would be costly and dangerous. The Supreme Court noted that each state has the power to change its law of riparian use and that drinking and other domestic uses of water are of the first importance. The Court held that the advantages resulting from defendant's diversion far outweighed the damages claimed and denied the injunction, but noted that plaintiff could renew its suit should defendant divert more than a reasonable amount of water in the future to plaintiff's substantial damage. (Liptak-Florida)
W71-02614

UNITED STATES V UTAH (STATE VERSUS FEDERAL OWNERSHIP OF BEDS OF NAVIGABLE RIVERS).
283 US 64, 51 S Ct 438-446 (1931).

Descriptors: *United States, *Interstate rivers, *Ownership of beds, *Navigation, Utah, Navigable rivers, Navigable waters, Non-navigable waters, Federal jurisdiction, State jurisdiction, Federal-state water rights conflicts, Colorado River, River beds, Riparian waters, Riparian land, Riparian rights, Legal aspects, Judicial decisions, Boundaries (Property), Public lands, Federal government, Remedies.

Plaintiff United States sued defendant Utah to quiet title to certain river beds in which plaintiff had granted mineral rights to certain parties while defendant had granted those same rights to other parties. Plaintiff contended that the river beds belonged to the federal government since the rivers were non-navigable when Utah was admitted to the Union and introduced evidence showing the paucity of navigation on the rivers at that time and the private rather than public nature of such navigation. Defendant contended that the rivers were navigable at the time of its admission into the Union and that therefore title to the river beds was vested in the state. The Supreme Court noted that the test of navigability was not the extent of actual use of the river for navigation or whether such use was public or private, but the capacity of the river for commercial navigation at that time. The court dismissed plaintiff's petition and held that the rivers in question were navigable in law, if not in fact. (Liptak-Florida)
W71-02616

NEW JERSEY V NEW YORK (INJUNCTION TO PREVENT DIVERSION OF DELAWARE RIVER).
283 US 336, 51 S Ct 478-481 (1931).

Descriptors: *New Jersey, *New York, *Delaware River, *Diversion, Pennsylvania, Alteration of flow, Reasonable use, Navigation, Riparian rights, Navigable waters, Non-navigable waters, Administrative agencies, Administrative decisions, Sewage treatment, Recreation, Fishing, Water pollution, Saline water, Agriculture, Judicial decisions, Legal aspects, Relative rights.

Plaintiff New Jersey sought to enjoin defendant New York from diverting water from the tributaries and watershed of the Delaware River. Plaintiff contended that the diversion would violate the riparian rights of its citizens, asserting impaired navigability, water power, sanitation and recreation. The Court appointed master found that the tributaries affected were non-navigable and that the diversion would not impair the sanitary condition of the river or affect its use for municipal water, industry, agriculture or fishing. However, the master recommended reduction of the diversion to prevent impairment of recreation and recommended installation of a sewage treatment plant. The Court observed that removal of water must be allowed unless substantial harm would result. Although the War Department found no navigational impairment, the court stated that defendant would have to yield to the Department's decision if navigation were later impaired. Affirming the master's report and recommendations, the court limited defendant's diversion to an amount which would not seriously injure plaintiff's rights. (Hart-Florida)
W71-02618

ARIZONA V CALIFORNIA (CONSITUTIONALITY OF BOULDER CANYON PROJECT ACT).
283 US 423, 51 S Ct 522-529 (1931).

Descriptors: *Arizona, *California, *Legislation, *Dam construction, Colorado River, Boulder Canyon Project Act, Prior appropriation, Dams, Colorado River Compact, Interstate compacts, Interstate rivers, Water supply, United States, Competing uses, Project purposes, Water allocation (Policy), Judicial decisions, Legal aspects, Adjudication procedure, Relative rights.

Plaintiff Arizona sought to enjoin defendant California from building a dam on the Colorado River. Plaintiff refused to ratify the Colorado River Compact, approved by Congress in the Boulder Canyon Project Act, which authorized the dam. Plaintiff contended that the Act violated its quasi-sovereign rights. The court noted that Congress could authorize the dam to improve navigation if the river were navigable. Taking judicial notice that the river was navigable, the court held that the Act was not invalid simply because the dam would further purposes other than navigation. Rejecting plaintiff's assertion that the Act prevented plaintiff

from appropriating more water, the court noted that an appropriation is vested, subject only to prior appropriation, and that under Arizona law, a perfected appropriation could only be acquired by physical diversion. The court held that an assumed potential invasion of plaintiff's right to appropriate water was insufficient to declare the Act unconstitutional. Defendant's motion to dismiss was granted. (Hart-Florida)
W71-02619

FLAMBEAU RIVER LUMBER CO V CHIPEWA AND FLAMBEAU IMPROVEMENT CO (DAMS AS OBSTRUCTIONS TO NAVIGATION).
223 NW 417-419 (Wis 1929).

Descriptors: *Wisconsin, *Dams, *Legislation, *Navigation, Lumbering, Access routes, Saw mills, bypasses, Dam construction, Sluices, Administrative agencies, State governments, Navigable rivers, Legal aspects, Judicial decisions, Regulation.

Plaintiff lumber company sought damages and to enjoin defendant dam owner from preventing transport of its logs downriver. Defendant's dams were constructed pursuant to statute, but without the approval of the railroad commission. The statute's purpose was to improve the river's navigability. Plaintiff asserted that the result of the dams was to destroy the navigability of the river. Defendant moved to dismiss the complaint for failure to state a cause of action. From an order sustaining the motion, plaintiff appealed. The court held that the complaint stated a cause of action and that the lower court erred in sustaining the motion to dismiss. (Hart-Florida)
W71-02620

MUNRO V MEILKE (OWNERSHIP OF ISLANDS IN UNMEANDERED NAVIGABLE LAKE).
227 NW 394-396 (Wis 1929).

Descriptors: *Wisconsin, *Land tenure, *Islands, *Ownership of beds, Real property, Legislation, United States, State governments, Reservation doctrine, Lakes, Navigable waters, Navigable rivers, Meanders, Streams, Boundaries (Property), Boundary disputes, Legal aspects, Judicial decisions.

Plaintiff island owner sued to quiet title to islands claimed by defendant, a lessee from the state. The islands were in an unmeandered lake. Plaintiff claimed title through a United States patent which conveyed two 40-acre tracts by governmental description. The islands were located within these tracts. Defendant claimed title through a congressional act which conveyed to the state all unsurveyed islands. Defendant claimed that the islands were part of the navigable lake beds and therefore were state-owned. The court noted that the congressional act passed nothing with respect to the islands since the former patents conveyed whatever title the United States held in them. While agreeing that title to navigable lake beds was in the state, the court noted that the size of islands was immaterial in considering if they were part of the lake bed since islands were not part of the lake bed. The court stated that: (1) a patentee of riparian land takes only to the shore of meandered lakes; (2) all land passes in a patent involving unmeandered lakes; and (3) unmeandered islands within meandered streams pass by patent with adjacent lots when the riparian owner holds title to the thread of the stream. The court affirmed the trial court's ruling that plaintiff owned the islands. (Hart-Florida)
W71-02621

MANNEY V PROUSE (RIGHT OF RIPARIAN OWNERS TO USE OF NON-NAVIGABLE LAKE).
248 Mich 654, 227 NW 685-687 (1929).

Descriptors: *Michigan, *Lakes, *Riparian rights, *Competing uses, Fishing, Boating, Farm ponds, Land use, Reasonable use, Ownership of beds, Relative rights, Remedies, Riparian land, Riparian waters, Usufructuary right, Legal aspects, Judicial decisions, Contracts, Non-navigable waters.

Plaintiff littoral landowner sought an injunction to restrain defendant littoral landowner from trespassing on the lake on which their properties abutted. Plaintiff purchased his tract from defendant, at which time defendant represented that all of the 10-acre, non-navigable lake was within plaintiff's boundaries. In fact, a small portion of the lake was within defendant's boundaries. After the sale, defendant used the lake for eight years before plaintiff brought this suit. Plaintiff asserted that because of the alleged fraud in the sale, defendant should be enjoined from using the lake. The court noted that under state law, defendant had the right to use all the lake providing riparian rights of other owners were not impaired. Rejecting plaintiff's assertion of fraud, the court noted that defendant's ownership of a portion of the lake was obvious to the casual observer, and concluded that actual fraud was highly improbable. Refusing to enjoin defendant from using the lake, the court affirmed the lower court's decision for defendant. (Hart-Florida)
W71-02622

GRANGER V CITY OF CANANDAIGUA (OWNERSHIP OF LAKE BED ACQUIRED THROUGH INTER-STATE TREATY).
257 NY 126, 177 NE 394-396 (1931).

Descriptors: *New York, *Lake beds, *Ownership of beds, *Boundaries (Property), Massachusetts, Navigable waters, Navigation, Riparian waters, Riparian land, Riparian rights, Land tenure, High water mark, Treaties, Legal aspects, State governments, Cities, Judicial decisions, Landfills, Public lands, Public rights, Boundary disputes.

Plaintiff landowner sued to restrain defendant city from filling in a lake for the purpose of building a park thereon. Plaintiff claimed title to the lake bed through the Treaty of Hartford, by which New York granted certain lands to Massachusetts, which in turn granted the lake bed to plaintiff's predecessor. Defendant contended that the lake was navigable and, therefore, New York retained title to the lake bed, the Treaty only passing riparian title to Massachusetts. The court noted that the question of ownership of beds was unsettled in New York, except on a lake-by-lake basis, and that navigability and size were not the only factors to be considered. Since private ownership had not been asserted for over 100 years and since such ownership would deprive other riparian owners of their riparian rights, the court held that title to the lake bed had remained in the state of New York and affirmed the trial court's judgment dismissing plaintiff's complaint. (Liptak-Florida)
W71-02623

HORNE V HOWE LUMBER CO (EFFECT OF ACCRETION ON PROPERTY BOUNDARIES).
190 SW2d 7-12 (Ark 1945).

Descriptors: *Arkansas, *Accretion (Legal aspects), *Avulsion, *Boundaries (Property), Legal aspects, Judicial decisions, Damages, Remedies, Ownership of beds, Navigable waters, Riparian land, Erosion, Federal government, Local governments, State governments, Surveys, Lumber.
Identifiers: *Geodetic surveys.

Plaintiff filed suit to restrain defendant from cutting timber on part of an island. Defendant and intervenors filed a cross-complaint for damages for timber plaintiff had cut, claiming that title plaintiff had allegedly received in a state tax sale was void because the land had been formed by accretion, not avulsion, and thus was in another county. Defendant won the trial court decision, and plaintiff appealed that defendant by statute could not challenge plaintiff's title unless defendant claimed title himself. The Supreme Court of Arkansas, in affirming the decision for defendant, held the statute applied only to sales by county clerks. The court further held that evidence was sufficient to show that the trial court was not erroneous in holding the land formed by accretion. Land which gradually forms by accretion belongs to the owner of the contiguous land to which it joins. The river remains its natural boundary. In avulsion, the watercourse suddenly changes but the property line remains at the old water line, not subject to the river's caprice. (Morris-Florida)

RANSBERRY V BRODHEAD'S FOREST AND STREAM ASS'N (ENTIRE BED OF STREAM CONVEYED BY DEED).

315 Pa 513, 174 A 97-99 (1934).

Descriptors: *Pennsylvania, *Boundary disputes, *Boundaries (Property), *Ownership of beds, Legal aspects, Judicial decisions, Water rights, Streams, Banks, Fishing, riparian rights, Riparian land, Adjudication procedure, Land tenure, Relative rights.

Plaintiff's predecessor in title conveyed by deed a large tract of land including a stream. There was excepted from the deed a small strip of land bordering the stream on the east. The large tract of land came into the possession of defendant forest and stream association. Plaintiff's deed, in describing the boundary of the small strip of land excepted, listed a stone on the east bank of the stream as the place of beginning and a post on the east bank as the end of the description. Plaintiff brought a quiet title action as to the small strip of land. The dispute depended on whether plaintiff's title to the small strip of land extended to the middle of the stream or ran only along the east bank. The Pennsylvania supreme court held that the description in the deed meant that the east bank of the creek was to be the boundary line. The court affirmed the lower court conclusion that the entire bed of the stream had been conveyed in the deed of the larger tract of land. (Powell-Florida)
W71-02634

WOODY V ABRAMS (BOUNDARY DISPUTE WHERE STREAM SUDDENLY SHIFTS COURSE).
169 SE 915-920 (Va 1933).

Descriptors: *Virginia, *Boundary disputes, *Avulsion, *Accretion (Legal aspects), Bank erosion, Boundaries (Property), Erosion, Streams, Watercourses (Legal), Beds, Channels, Land tenure, Banks, Ditches, Dikes, Diversion, Riparian rights, Judicial decisions, Legal aspects, Riparian land.

Plaintiffs brought statutory proceedings to fix the division line between their lands and the land of defendant adjoining landowner. Plaintiffs' and defendant's lands had originally been divided by a line running with a creek. Plaintiffs contended that there had been a sudden change in the course of the creek and that the boundary line remained the old bed of the creek. The jury returned a verdict for plaintiffs, and the Virginia Supreme Court of Appeals affirmed. Erosive accretions attach to the land on which they fall. In such gradual and natural processes the boundary follows the varying course of the stream. However, if for any natural or artificial cause there is avulsion or sudden change in the bed of the stream, the boundary remains the middle of the old channel. There was no reversible error in the jury verdict for plaintiffs. (Duss-Florida)

PUBLIC PROBLEMS AND NON-DECISION MAKING--A STUDY OF THE TUCSON WATER SYSTEM,
Colorado State Univ., Fort Collins. Dept. of Political Science.
John Adrian Straayer.
Natural Resources Journal, Vol 10, No 3, p 545-556, July 1970.

escriptors: *Water supply, *Water management, ater pollution, Groundwater.
entifiers: *Decision-costs, Water bank, Regu-ed monopoly.

his paper considers the failure of political systems Tucson, Arizona to produce a comprehensive ogram directed toward eliminating the water pply problem. The source of the problem can be und in rapid population growth and diminishing ater sources. Water management in Tucson is ghly decentralized with water available to anyone o sinks a well anywhere in the basin. The lack of ganization of the water system has generated nflict among public and private organizations in-lved in water use. The failure to solve the water oblem is attributed to several factors. First, olitical boundaries do not match problem boundae. Secondly, federal funds have been slow in ming with the result that Tucson has had to oulder the decision-costs alone. Third, a change state legislation is necessary if indiscriminate ater drilling is to cease. The conclusion for Tucn is that the public policy designed to improve e environment tends to be formed only in sponse to known problems as perceived by decin makers who have already invested resources in crisis. (Siegenthaler-Rutgers)

ITY OF SCOTTSVILLE V HEWITT (COVE-ANT TO PROVIDE WATER NOT EXTIN-UISHED BY ACT OF GOD).

34 Ky 656, 28 SW2d 984-986 (1930).

escriptors: *Kentucky, *Water sources, *Springs, Supply contracts, Legal aspects, Judicial decions, Damages, Remedies, Cities, Local governents, Municipal water, Water supply, Water conveyance, Water levels, Spring waters, Farms, umping, Water resources, Subsurface waters.

laintiff farmer sued defendant city for breach of a ovenant to supply his farm with water via a water rough from a spring on land which plaintiff sold to efendant. The agreement was part of the conderation for the sale, but defendant argued that he covenant to install a water trough did not mean also had to supply water and, secondly, that an ct of God, which lowered the water supply, extinuished the obligation. Defendant had installed the rough and a replacement, but the water level of he spring decreased enough to make it inoperave. The Court of Appeals of Kentucky, in affirmng a verdict for plaintiff, held the language of the ovenant necessarily implied that defendant would upply water. The court also held that an absolute ndertaking is not discharged by an act of God aking performance more difficult. Plaintiff was warded damages and an injunction requiring deendant to provide water. (Morris-Florida)

UNITED STATES V DOUGHTON (MEANING OF NAVIGABLE WATERWAYS UNDER THE COMMERCE CLAUSE).

52 F2d 936-940 (4th Cir 1933).

Descriptors: *Navigable waters, *Non-navigable waters, *Federal jurisdiction, *Inland waterways, Navigation, Streams, Federal government, Legal aspects, United States, North Carolina, State jurisdiction, Judicial decisions, Boats, Transportation, Lumbering, Bridges, Engineering structures.

Plaintiff federal government sought to enjoin the highway commission of North Carolina from maintaining a bridge across a creek. The creek had been dredged and made a part of an inland waterway constructed by plaintiff. Plaintiff contended that the creek was a navigable stream subject to the plenary federal power over navigation under the commerce clause. Plaintiff contended that the bridge was an obstruction to the new waterway. Defendant contended that the stream was not a navigable waterway within the purview of the commerce clause. The Circuit Court of Appeals, Fourth Circuit held that for a stream to be within the regulatory power of Congress as navigable water of the United States, it must be susceptible in its natural condition of becoming a highway of commerce. The mere fact that the stream had occasionally been used by small boats and for floatage of logs did not establish a susceptibility of becoming a highway of commerce, especially in light of the smallness of the creek. The creek was non-navigable and not subject to federal regulation. The injunction was denied. (Snow-Florida)

CLARK V PIGEON IMPROVEMENT SLIDE AND BOOM CO (FREE AND OPEN COMMERCE OF CANADA-UNITED STATES BOUNDARY STREAMS REQUIRED BY TREATY).
52 F2d 551-557 (8th Cir 1931).

Descriptors: *Treaties, *Streams, *Minnesota, *Lumbering, Obstruction to flow, Foreign trade, Foreign waters, Stream flow, Judicial decisions, United States, Barriers, Floating, International law, International waters, Interstate rivers, Relative rights.

Plaintiff, a Canadian citizen, brought an action for an injunction to stop defendant from obstructing the floatage of logs down a stream. Plaintiff contended that the stream, being a boundary stream between Canada and the United States pursuant to the Webster-Ashburton Treaty, was to be open and free for trade and travel under the terms of the treaty. Defendant, a corporation authorzed by Minnesota legislation to tax floatage of logs upon the stream, contended that its obstruction to the stream was a permissible means of collecting its tolls. The court held that the treaty establishing the Canadian border was superior to Minnesota legislation, and thus the provision in the treaty establishing border streams as free and open to commerce was to govern. Defendant was thus enjoined from imposing any tax upon the floatage of logs and was enjoined from further hindering the floatage of logs down the stream. (Snow-Florida)
W71-02675

PEARCE V SCOTT (OBSTRUCTION OF NATURAL FLOW OF DRAINAGE FROM DOMINANT LAND).
29 F2d 630-631 (DC Cir 1928).

Descriptors: *District of Columbia, *Obstruction to flow, *Natural flow doctrine, *Repulsion (Legal aspects), Relative rights, Barriers, Legal aspects, Remedies, Damages, Judicial decisions, Surface waters, Riddance (Legal aspects), Drainage water, Snowmelt, Surface drainage, Runoff, Rain water.

Plaintiff upper landowner sought to enjoin defendant lower landowner from maintaining a road which ran along the boundary of the two adjoining tracts of land. The road obstructed the natural flow of surface water from plaintiff's land and caused the waters to collect on his land. Plaintiff contended that an upper landowner had a right to the unobstructed flow of surface water from his land. Defendant contended that a lower landowner could lawfully obstruct the natural flow of surface water from higher property. The United States Court of Appeals for the District of Columbia held that the common law rule, which grants the right to obstruct surface waters to lower landowners, applied. Therefore, the injunction against defendant would not issue. (Quesada-Florida)
W71-02684

CANE CREEK COAL MINING CO V BRADEN (DAMAGES CAUSED BY COAL COMPANY'S IMPEDING FLOW OF STREAM).
144 So 143-145 (Ct App Ala 1932).

Descriptors: *Alabama, *Obstruction to flow, *Floods, *Coal mine wastes, Overflow, Water pollution, Damages, Flow, Streams, Rainfall, Flood damage, Watercourses (Legal), Wastes, Industrial wastes, Water pollution sources, Legal aspects, Judicial decisions, Adjudication procedure.

Plaintiff landowner brought suit to recover damages from defendant coal company. Plaintiff alleged that defendant had clogged a stream with debris, thereby obstructing the flow so that during heavy rainfall the stream overflowed plaintiff's land and damaged his crops. Defendant contended that another coal company had washed debris into the stream and that there was concurrent liability for plaintiff's damage. Therefore, plaintiff had the burden of proving what portion of the damage was allocable to each operation. The Court of Appeals of Alabama, affirming a lower court verdict for plaintiff, held that there was sufficient evidence of concert of action, and it was for the jury to fix the damage done by defendant. Also, the trial court properly refused instruct the jury that heavy rainfall was a basis for ignoring defendant's clogging of the stream. Finally, non-expert witnesses were qualified to testify as to the clogged condition of the stream. (Duss-Florida)

In: Flood Damage Abatement--Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 1-17, July 1970.

Descriptors: *Flood control, Flood damage, Urban renewal, Urbanization.
Identifiers: *Flood plain management, *Flood plain information, Metropolitan areas.

The city of Waterloo, Iowa suffered severe flooding in the 1960's because of its location at the confluence of 5 rivers. The great damage stimulated civil leaders to seek flood control planning by initiating a program with the Department of Housing and Urban Development. Flood control programs included raising bridges, river dredging and land fill, constructing an industrial part, purchasing land, and securing cooperation from various civil groups. Parks were recommended for low areas because flood damage would be inexpensive. Close work with the Army Corps of Engineers was vital to flood control planning. (See also W71-00002) (Wray-Chicago)

LAND USE MANAGEMENT AN ECONOMIC NECESSITY,
Kentucky Univ., Lexington.
L. Douglas James.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 18-32, July 1970. 1 ref.

Descriptors: *Flood control, Water management.
Identifiers: *Flood plain management.

Land use management should emphasize the best rather than the least use of flood plains. Excessive restriction of flood plain development can hamper the long-term economic growth of any community. Excessive development can lead to a flood damage epidemic. Structural measures are engineering works used to control flood damages on the community level. Nonstructural measures are employed by individuals to reduce damage to their own property. Flood control alternatives must be considered for engineering feasibility, economic feasibility, financial feasibility, social feasibility, and political feasibility. It is unwise for a community to manage flood plain land use by relying entirely on individuals planning the use of their own land to meet their own best needs. The most effective management program is the one where the community uses the management decisions of the property owners to the fullest extent. New federal policy seeks to motivate communities to require individuals to employ nonstructural measures by making free structural measures contingent on an active nonstructural program. The flood proofing decision must consider the range of available methods and the cost and reduction in average annual damages associated with each one. An active and informed land use management program can make a major contribution toward the economic growth of communities containing substantial areas in flood plains. FLOOD PLAIN INFORMATION REPORTS,
Corps of Engineers, Washington, D.C.
George R. Phippen.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 33-38, July 1970.

Descriptors: *Flood control, Planning, Federal government.
Identifiers: *Flood plain management, *Flood plain information.

The Army Corps of Engineers' Flood Plain Management Services Program provides the basic flood information, interpretations, technical services, and guidance, with encouragement to the non-federal section which will enable it to plan for appropriate use of flood plains. The Federal Plain Information Report gives information on floods and flood areas, including graphical presentations and photographs. Two types of flood probability are called the Intermediate Regional Flood and the Standard Project Flood. The information in the report is used to identify the flood plain and to show the depths of flooding which may occur. This is helpful in forming zoning restrictions, subdivision regulations, and building codes. (See also W71-00002) (Wray-Chicago)
W71-02652

ENGINEERING DATA FOR SOUND LAND USE PLANNING,
Corps of Engineers, Washington, D.C.
John R. Philpott.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 39-44, July 1970.

Descriptors: *Flood control, Future planning.
Identifiers: *Flood plain information, *Flood plain management.

The purpose of the flood plain information report is to provide specific and detailed knowledge of the flood situation at desired locations. It is possible to determine to a reasonable degree of accuracy, the average return interval of a particular flood height or flow rate at various locations for floods up to the size of about the 100-year flood. After the average flood expectancy is figured, decisions must be made on the use of the flood plains. The Corps of Engineers and the Weather Bureau cooperate in estimating the flood potential of streams. They can also determine the waterway area available at any elevation, or in the case of a known flood height and rate of flow, they can measure the depth of flow by inspection, and compute the velocity of the flow. The conventional approach to flood problems is constructing dams or levees; these structures often do not prevent all flooding, especially in downstream areas. Developers are often lured to downstream areas believing them to be flood-safe. The data available for preventing developments in hazardous areas is available through the Corps of Engineers, TVA, U.S. Geological Survey, U.S. Weather Bureau and other organizations. W71-02653

FLOOD PLAIN INFORMATION STUDIES APPLIED TO LOCAL CONDITIONS,
Henrico County, Va.
William W. Fleming.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 45-52, July 1970.

Descriptors: *Flood control, Future planning.
Identifiers: *Flood plain information, *Flood plain management.

Effective flood plain planning usually requires flood plain zoning, technical personnel to establish design standards and criteria, and a working relationship with the U.S. Army Corps of Engineers. A serious problem in developing design standards and flood control is delineating the flood plain contours on major watersheds. When the probable flood lines are established by the Corps, zoning must be comprehensive. In any rapidly expanding urban area, drainage problems, unless properly controlled, will increase proportionally to the density of development. Zoning must be enforced to prevent developments in flood prone areas. (See also W71-00002) (Wray-Chicago)
W71-02654

OPEN SPACE PROGRAM, LAND USE MANAGEMENT,
Department of Housing and Urban Development, Washington, D.C.
Stanley Glowacki.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 53-64, July 1970.

Descriptors: Urban renewal, Community development.
Identifiers: *Open space, Metropolitan areas.

The Department of Housing and Urban Development provides a 50% grant program to metropolitan regions seeking to develop open space areas in flood control management. The current effort is to turn the program toward the intercity, and low-income areas. Although 50% grants are offered for land acquisition only 12 1/2% of the acquisition cost is allowed for development (except in low income areas). The intent of HUD is to put the money where the people are, where the great masses of people can enjoy open spaces created with HUD money. Land that is acquired by a community with HUD aid must remain in open use forever. The only way such land is taken out of open space use is through release by HUD and replacement with land of equal fair market value elsewhere within the community. Applicants for HUD funds wait less than six months to know if they will receive assistance. Two independent appraisals are required for each application. (See also W71-00002) (Wray-Chicago)

OPEN SPACE PROGRAM OPPORTUNITY IN LAND MANAGEMENT,
National Capital Park and Planning Commission, Washington, D.C.
Frank Rubini.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 65-67, July 1970.

Descriptors: *Flood control, Conservation.
Identifiers: *Flood plain information, *Flood plain management, Open space.

Large population growth and ensuing land developments in narrow stream valleys contribute to high velocity runoff and unmanageable accumulations of storm waters. Water retention structures and land treatment measures are methods of dealing with this problem. In Maryland and Washington, D.C. recreation development is restricted to no more than one-third of a given land parcel, with the

balance for passive or conservation use. Largely grassed or wooded, these areas serve as effective aquifer sponges, and contribute to the reduction of runoff velocity. (See also W71-00002) (Wray-Chicago)
W71-02656

COMPREHENSIVE FLOOD PLAIN DEVELOPMENT WITH TVA,
Tennessee Valley Authority, Knoxville.
John W. Weathers.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 68-71, July 1970.

Descriptors: *Flood control.
Identifiers: *Flood plain information, *Flood plain management.

The Tennessee Valley Authority initiated its flood plain management assistance (local flood relations) program in 1953 with a fixed formula for solving flood problems. TVA would supply basic flood data to a community which would then exercise its police power through zoning ordinances, subdivision regulations, and building codes to control uses of flood hazard areas. The data is supplied only when requested by the local community and sent to the designated state agency for endorsement. The community must show its intent to use the information and the state agency must pledge its assistance. Wide distribution of the report and counseling with prospective developers of flood plain lands often result in adjustments to the flood problem. Local planning commissions proceed with flood plain regulations when the data is documented. TVA and state personnel assist the planning commission in presenting the recommendations to the governing body. TVA also responds to requests for appraisals of flood problems associated with industries, subdivisions, utilities, roads and streets. (See also W71-00002) (Wray-Chicago)
W71-02657

A CASE IN POINT,
Coeburn, Va.
W. C. Lambert.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 72-74, July 1970.

Descriptors: *Flood control, Community development.
Identifiers: *Flood plain management, *Flood plain information.

After the town of Coeburn, Virginia suffered severe flooding in 1963, the town council appointed a flood study commission to cooperate with TVA in the development of a comprehensive flood damage prevention plan. A feasibility study and subcommittees were set up. The resulting flood control project also stimulated industrial development and beautification project. Suggested improvements for TVA's program include having property appraisals done by federal and local agencies and acquiring more adjacent land for recreational uses. (See also W71-00002) (Wray-Chicago)

FAIRFAX COUNTY COOPERATES,
Fairfax County, Va.
Carl W. Porter.
In: Flood Damage Abatement, Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, p 87-94, July 1970. 1 map.

Descriptors: *Flood control, Management, Planning.
Identifiers: *Flood plain management, *Flood plain information.

In the rapidly expanding urban area of Fairfax County, Virginia, the natural forest cover was removed and serious flooding occured more frequently. Private studies analyzed the flood hydrology of the streams, established the flood plain levels, and included master plans for improvements to protect those areas already developed and exposed to worsening periodic flooding. When the plans were completed and the referendum held, the citizens voted it down. The County then entered into a pilot study project with the U.S. Geological Survey. Both the county and the Geological Survey were enthusiastically hopeful that it would enable such a fast developing urbanizing area to plan ahead. An order of priorities was established secheduled to give first priorities where most of the new development was taking place. Because of skyrocketing land values, the county employed private surveyors to establish monumental base lines to good second-order survey accuracy in addition to the Geological Survey maps. Sections of the building code and zoning restrictions are listed. (See also W71-00002) (Wray-Chicago)

FLOOD PLAIN MANAGEMENT IN WISCONSIN,
Wisconsin Dept. of Natural Resources, Madison. Flood Plain and Shoreland Management Section.
Thomas M. Lee.
In: Flood Damage Abatement--Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, July 1970, p 95-108. 2 fig.

Descriptors: *Flood control, Management, Planning.
Identifiers: *Flood plain management, *Flood plain information, Comprehensive planning.

In 1966 Wisconsin legislature provided for joint local-state action for flood damage abatement. Local units of government are required to enact, administer and enforce reasonable and effective flood plain zoning ordinances. State responsibilities include establishing and upgrading minimum standards for flood plain regulations, surveillance, and coordinating flood plain management with programs of other federal, state, local and private organizations. Flood plain management standards reflect the necessity of providing for the needs of nature and man. First the stream channel and floodway are retained, usually to be used for agriculture, recreation, or parking. Next, flood protection is provided for areas outside the floodway but still subject to inundation by flood waters. When community development plans provide for significant use of the flood plain, it is necessary to determine the changer in flood heights which will be caused by future developments. State standards govern these developments. The Corps of Engineers flood plain management services program has been most effective in assisting communities in flood plain delineation. One of the most important aspects in tailoring flood plain regulations to local needs is the selection or determination of the floodway. Ten hydraulic factors that influence the selection of the floodway are listed. Success of Wisconsins flood plain management program depends on thorough public understanding, local support, and enforcement of land use regulations. (See also W71-00002) (Wray-Chicago)

GOVERNMENTAL COOPERATION IN RECREATION AND FLOOD PLAIN DEVELOPMENT,
Virginia Outdoor Recreation Commission.
Elbert Cox.
In: Flood Damage Abatement--Federal Assistance to Local Government, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, July 1970, p 109-114.

Descriptors: Flood control.
Identifiers: *Flood plain management, *Flood plain information.

The Commission of Outdoor Recreation was conceived to further cooperation and coordination of programs in recreation by different levels of government. Funds are divided between federal government and states on a 60/40 basis. Flood Plains often provide choice sites for park and recreation facilities. The Flood Plain Zoning Act amendment authorizes counties or municipalities to impose zoning on flood plains to give them protection. The Commission will make studies of individual rivers, prepare reports to the General Assembly with specific recommendations for the creation of a scenic river. The development of recreational areas and scenic rivers can contribute materially to flood damage abatement. (See also W71-00002) (Wray-Chicago)

SCS PROGRAMS IN URBAN AND RURAL DEVELOPMENT,
Soil Conservation Service, Beltsville, Md.
John K. Abernathy.
In: Flood Damage Abatement--Federal Assistance to Local Government, Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, July 1970, p 115-121.

Descriptors: *Flood control, *Conservation, Water policy.
Identifiers: *Flood plain management, *Flood plain information, Metropolitan areas, Water resources planning.

The services of the Soil Conservation Service are available in helping solve urban and suburban as well as rural conservation problems. The urban expansion has brought conservation problems to nonfarm lands. The SCS of Virginia had programs involving (a) soil surveys, (b) assistance through conservation districts, (c) assistance to non-farm and urban groups, (d) resource conservation and development projects, (e) preparation of natural resource data, (f) water-resource activities and river-basin investigations, and (g) small watersheds. NEW LOOK IN CONSERVATION BRINGS NEW HOPE FOR ENVIRONMENTAL QUALITY,
Sydney Howe.
In: Water Spectrum, Vol 2, No 3, Fall 1970, p 2-5.

Descriptors: *Conservation, *Resource development, *Environment, *Political aspects, *Organizations, Federal government, Planning.
Identifiers: *National Environmental Policy Act of 1969, *Council on Environmental Quality, *Confrontation, *San Francisco Bay Conservation and Development Commission, *Conservation Foundation, Corps of Engineers.

In recent years the narrower ethic of the conservation movement which emphasized rural or wilderness preservation has been broadened to encompass the whole environment of man. Rampant technology has with all its blessings, brought unwanted by-products and multiplied the pressures upon basic natural resources, making their conservation more complex. New organizations and new coalitions are adding to the political pressure where decisions regarding environmental quality standards are made. The author reviews coalitions that have formed recently; the expanded 1970 appropriations by congress is traced back to this in-

creased activity. It is contended that there is strength in the diversity of organizations. Governments at all levels are beginning to reflect public impatience with environmental insults. The National Environmental Policy Act of 1969 establishes the Council on Environmental Quality to advise the President and to direct all Federal agencies in recommending legislation. It is suggested that 'healthy confrontation' based on tolerance, education, and give-and-take with unbiased and complete public information will insure effective problem solving. The San Francisco Bay Conservation and Development Commission is cited as an example of such convergence as are efforts by the Conservation Foundation in a number of areas conflicts. Stressed is the need for stricter, more comprehensive analysis of alternatives with conservationists and developers cooperating in finding solutions.

THE ROCK AND BONG TECHNIQUES OF MEASURING WATER LEVELS IN WELLS,
Missouri Univ., Rolla. Dept. of Geology and Geophysics.
David M. Stewart.
Groundwater, Vol 8, No 6, p 14-18, November-December 1970. 5 p, 1 fig, 2 tab.

Descriptors: *Water levels, *Water wells, *Sounding, *Depth, Measurement, Water measurement, Instrumentation, Surveys, Velocity, Sound waves, Calibrations.
Identifiers: Well water levels, Fall time, Reverberation.

The depth to water in wells can be measured by timing the fall of a marble or BB. Depth to water can also be determined in terms of the frequency of the reverberations heard in a well. Because of their inherent inaccuracies these methods cannot replace the standard methods such as the steel tape or electric sounder. But both have a wide range of useful applications. Considerable time could be saved if an estimate were known before applying a steel tape or electric sounder. The reverberation technique has the distinct advantage of applicability to wells that have no access. The fall technique can be used when falling water makes a steel tape useless and an electric sounder is not available. (Knapp-USGS)

DISTRIBUTION OF PLANKTON IN RELATION TO THE LAYER OF REDUCED TRANSPARENCY (IN RUSSIAN),
Akademiya Nauk SSSR. Institut Okeanologii.
E. A. Lubny-Gertsyk, and V. I. Degtyarev.
Doklady Akademii nauk SSSR, Vol 176, No 2, p 443-445, 1967. 1 fig, 6 ref.

Descriptors: *Sampling, *Pacific Ocean, *Plankton, Analysis, Photosynthesis, Distribution patterns, Photometry, Tropical regions, Nets.
Identifiers: *Transparency, Vertical distribution, Coordinated sampling method.

The relationship between the transparency of water and the vertical distribution of plankton was investigated during the expedition of the ship 'Vityaz' to the tropical zone of the Pacific Ocean. The position of the reduced transparency layer was determined by a light meter of the FPM-60 type. The simultaneous 'coordinating sampling' of plankton in the layer of reduced transparency was done by nets, ocean model DZhOM-80/113. Despite of inaccuracies of analyses, inflicted by ship movement, a general relationship between the plankton density and the position of the reduced transparency layer was observed. The minimum transparency and the maximum density of plankton were confined to an approximate depth of 20 meters. The introduced method of 'coordinated sampling' promises to explain the peculiarities in plankton distribution and the nature of the reduced transparency layers. (Wilde-Wisconsin)

PRELIMINARY INVENTORY OF THE WATER RESOURCES OF IDAHO.
Idaho Univ., Moscow. Water Resources Research Inst.

Idaho Water Resource Board Report, 1968. 598 p, 242 fig, 38 map, 52 tab.

Descriptors: *Water resources, *Idaho, Surface waters, Groundwater, Water quality, Streams, Streamflow, Lakes, Runoff, Flow rates, Water yield, Climatology, Reservoirs, Consumptive use, Water control, Water rights, Hydrologic data, Irrigated land, Aquifers, Meteorology, Evaporation, Water balance, Hydrography, Precipitation (Atmospheric), Maps, Bibliographies.
Identifiers: *Idaho Water Resource Board.

Through contracts with various agencies, the Idaho Water Resource Board is engaged in a series of studies that will be used as a basis for supporting Idaho's position in regional and interstate basin investigations, in the development of a State Water Plan, and for informational reports for private or public use. Historical records as well as current conditions are utilized to identify the sources of water, the magnitude of yields and flows, the dependability of the supply, the character of the water, and the extent of water use. The report is organized into chapters on climatology (atmospheric water resources), surface water, groundwater, water use and water control, and water rights. An appendix contains numerous supporting data and a comprehensive bibliography. A very valuable part of the report is the extensive atlas that includes maps showing climatological information, surface water supply information, availability of groundwater to wells, presently irrigated land, locations of decreed water rights, and other hydrologic and water use information. (Woodard-USGS)

08. ENGINEERING WORKS

8A. Structures

REPORT ON FOURMILE RUN FLOODING, ALEXANDRIA, VIRGINIA.
Greeley and Hansen, Chicago, Illinois.

Report to City of Alexandria, Virginia, April 1968. 66 p, 14 fig, 5 tab.

Descriptors: *Flood protection, *Flood control, *Storm runoff, *Urbanization, *Drainage engineering, *Storage, Maximum probable flood, Virginia, Flash floods, Land development, Channel improvement, Flood plains, Construction costs, Planning, Flood plain zoning, Runoff.
Identifiers: *Fourmile Run, Arlington County, Alexandria, Arlandria.

General design criteria are developed along with a basis of design for the construction of engineering works to protect property from flooding along Fourmile Run between the stream's outlet to the Potomac River and the Shirley Highway. Fourmile Run carries stormwater runoff from an 18.5 square mile drainage area in Arlington County. Extensive damage to commercial and residential properties results from flash floods, particularly in the Arlandria area at the North boundary of the City of Alexandria. The data obtained on the maximum flood of record, August 20, 1963, were considered in the study. The recommended basis of design is to provide for a minimum discharge of 20,000 cfs, but, preferably, 24,000 cfs. The construction costs for the latter are estimated at $9,437,000, based on 1968 unit costs. The project would entail: the removal and construction of new culverts, bridges and a railroad trestle which constitute streamflow bottlenecks; provision of storage in the main stem by channel improvement and levee construction; off-channel detention storage on City-owned property located in the flood zone; and miscellaneous provisions, including possible removal of buildings from the flood plain. The Fourmile Run flash flooding problem is a prime example of similar situations in various parts of the country. (Poertner)

Identifiers: *Underground structures, Design, *Rock (Geology), Deformation, Elasticity, Shear stresses, Pressure, Grout, Anisotropy, Structural properties, USSR, Translations, Rock mechanics, *Pressure tunnel linings, *Tunneling (Excavation).

Formulas are derived for the stresses and radial deformation of a pressure tunnel lining in anisotropic rock using the theory of elasticity. The surrounding rock is assumed to be transformed into a monolithic elastic medium by grouting. It is shown that it is possible to consider, with small error, only radial components of deformation and elastic resistance. By using a constant coefficient of elastic resistance, the formulas are transformed into the formulas for an isotropic medium. The deformations obtained by these formulas for a thin lining coincide reasonably close with the corresponding deformations for an opening in an orthotropic medium loaded along the contour with a uniform radial load. An example calculation is given.

TUNNEL BORING TECHNOLOGY, DISK CUTTER EXPERIMENTS IN SEDIMENTARY AND METAMORPHIC ROCKS,
Bureau of Mines, Washington, D.C.

Roger J. Morrell, William E. Bruce, and David A. Larson.
Available from the NTIS as PB-193 982, $3.00 in paper copy, $0.95 in microfiche. Report of Investigation No 7410, July 1970. 32 p, 12 fig, 6 tab.
Identifiers: *Tunnels, Boring, *Subsurface structures, Excavation, *Rocks, Fragmentation, Cutting machines (Tools), Compressive properties, Rock excavation, Performance, Force, Limestone, Marble.

Disk-cutter experiments were performed on five rock types ranging in compressive strength from 9.000 psi to 27.000 psi. A specially constructed testing machine called a linear-cutter apparatus (LCA) was designed to load and traverse a free-rolling disk cutter across a sawed rock surface. The LCA was instrumented to measure the vertical and horizontal forces acting on the cutter during the run. The ability of disk cutters to fragment rock was determined for both 60-degree and 90-degree cutting-edge angles, and relationships and regression equations were developed to predict cutter performance based on rock physical properties and applied forces.

Identifiers: *Boundary layer flow, *Boundary layer photography.

The measurement of velocity in the boundary layer region of open channel flow can be a difficult problem using probes. A microscope can be used to observe the motion of small tracer particles and yield quantitative velocity data without disturbing the flow. Micron particles were photographed through a microscope as they passed through the focal field oriented parallel to the channel bottom. Particle velocity data was used to compute a mean velocity profile, turbulence intensity and skewness of the particle velocity distribution. Errors can arise in the computation of mean velocity and turbulence intensity. These errors are analyzed quantitatively. (Knapp-USGS)

EFFECTS OF PROPOSED BARRIERS ON HURRICAN SURGE HEIGHTS - REPORT 1 OF GALVESTON BAY HURRICANE SURGE STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
N. J. Brogdon.
Army Corps of Engineers Waterways Experiment Station Technical Report H-69-12 (No 1 of 3 Reports), September 1969. 167 p, 5 fig, 118 plate, 6 tab.

Descriptors: *Barriers, *Hurricanes, *Surges, *Bays, *Texas, *Flood protection, Gulf of Mexico, Model studies, Tides, Salinity, Distribution patterns, Structures, Navigation, Inland waterways, Discharge (Water), Flooding, Hydraulic models, Model studies, Flood control.
Identifiers: *Galveston Bay (Tex).

Design of barriers for protection of all or portions of Galveston Bay against inundation by hurricane surges required the use of hydraulic model studies of the Galveston Bay complex to verify the results of surge routings by analytical methods and to determine the effects of all proposed structures on normal tides and hurricane surge heights upstream and downstream from barrier sites. The model reproduced the coast from Freeport on the south to High Island on Bolivar Peninsula on the east and included an average width of the Gulf of Mexico of about 25 miles, measured normal to the gulf. Hurricane surges were reproduced by a horizontal-displacement type surge generator. Either of the two major hurricane protection plans tested would provide protection for the area inland from the barrier when the navigation openings were closed. The Alpha plan, located on the coastline of the Gulf of Mexico, would provide protection for a greater area since it shelters practically the entire area inland from the coastline. The Gamma plan leaves unprotected a major portion of West Bay, the entire city of Galveston, and all of East Bay. The Texas City, LaMarque-Hitchcock system, when completed, will provide protection for these towns from surges of 15 ft msl. (See also W71-02244 and W71-02245). (Woodard-USGS)
W71-02243

EFFECTS OF PROPOSED BARRIERS ON TIDES, CURRENTS, SALINITIES, AND DYE DISPERSION FOR NORMAL TIDE CONDITIONS - REPORT 2 OF GALVESTON BAY HURRICANE SURGE STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
W. H. Bobb, and R. A. Boland, Jr.
Army Corps of Engineers Waterways Experiment Station Technical Report H-69-12 (No 2 of 3 Reports), July 1970. 140 p, 2 fig, 73 plate, 9 photo, 12 tab.

Descriptors: *Barriers, *Hurricanes, *Surges, *Bays, *Texas, *Flood protection, Gulf of Mexico, Model studies, Tides, Salinity, Distribution patterns, Structures, Navigation, Discharge (Water), Flooding, Hydraulic models, Model studies, Flood control.
Identifiers: *Galveston Bay (Tex).

Migration from cities to suburban areas combined with industrial growth justifies hurricane protection for the Galveston Bay area. Models indicated two barrier schemes would protect upstream areas. Alpha barrier was located just behind the gulf beaches and Gamma barrier crossed Galveston Bay 9 miles upstream. Both schemes provided gated navigation openings across channels and gated tidal passages of sufficient capacity, located to maintain existing conditions with respect to tides, currents, salinities, and dispersion patterns. Diversion of Trinity River flow to Houston, which would increase fresh water to Buffalo Bayou and decrease fresh water to Trinity Bay, is proposed. A power station will pump up to 3500 cfs of cooling water from Houston Ship Channel and Tabbs Bay via Cedar Bayou to the plant and discharge into Trinity Bay. Tests for normal tides were made in a 1:600-, 1:60-scale model. Important conclusions were: (a) diversions from Trinity River to Houston will have no significant effects; (b) Cedar Bayou Power Station will transport water which is more saline and of poorer quality from Houston Ship Channel and Tabbs Bay to upper Trinity Bay; (c) plan 1 Alpha barrier would have no significant effects on tides, currents, salinities, or dye dispersion patterns and the area of tidal passages could be reduced 20% without adversely affecting navigation; and (d) plan 1 Gamma barrier would cause slight reductions in tidal prism and salinities. (See also W71-02243 and W71-02245). (Woodard-USGS)
W71-02244

EFFECTS OF PLAN 2 ALPHA AND PLAN 2 GAMMA BARRIERS ON TIDES, CURRENTS, SALINITIES, AND DYE DISPERSION FOR NORMAL TIDE CONDITIONS - REPORT 3 OF GALVESTON BAY HURRICANE SURGE STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
W. H. Bobb, and R. A. Boland, Jr.
Army Corps of Engineers Waterways Experiment Station Technical Report H-69-12 (No 3 of 3 Reports), July 1970. 106 p, 61 plate, 7 photo, 10 tab.

Descriptors: *Barriers, *Hurricanes, *Surges, *Bays, *Texas, *Flood protection, Gulf of Mexico, Model studies, Tides, Salinity, Distribution patterns, Structures, Navigation, Fishing, Recreation facilities, Discharge (Water), Flooding, Hydraulic models, Model studies, Flood control.
Identifiers: *Galveston Bay (Tex).

Hurricane protection barriers are proposed for the Galveston Bay area. A separate model indicated that two barrier schemes would protect upstream areas: the plan 2 Alpha barrier was located just behind the gulf beaches and the plan 2 Gamma barrier crossed Galveston Bay 9 miles upstream. Both schemes provide gated navigation openings across channels and gated tidal passages of sufficient capacity, located to maintain existing conditions with respect to tides, currents, salinities, and dispersion patterns. Gated tidal passages are expensive and should be held to a minimum. Tests for normal tides were made in a 1:600-, 1:60-scale model for pre- and post-barrier conditions, and tides, currents, salinities, and dispersion patterns were observed. Important conclusions were: (a) the plan 2 Alpha barrier would have no significant effects on tides, currents, salinities, or dye dispersion patterns; (b) maximum current velocities in the navigation opening of the plan 2 Alpha barrier would be about 5.2 fps for normal tide; (c) the plan 2 Gamma barrier would cause slight reductions in the tidal prism and salinities upstream of the barrier. (See also W71-02243 and W71-02244). (Woodard-USGS)
W71-02245

VELOCITY AND SURFACE SLOPE RELATIONSHIPS IN UNSTEADY LAMINAR FLOW,
Cincinnati Univ., Ohio. Dept. of Civil Engineering.
Louis M. Laushey.
French summary. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 441-449, 1969. 9 p, 7 fig, 1 tab, 2 ref.

Descriptors: *Groundwater movement, *Unsteady flow, *Laminar flow, Slopes, Velocity, Water table, Darcys law, Mathematical studies, Equations, Flow characteristics, Viscosity, Density, Aquifer characteristics, Permeability.
Identifiers: Darcy law modification.

The Darcy law of proportionality of water table slope and velocity is shown to be incorrect for unsteady laminar flow. When the water surface is falling, the horizontal flow velocity will be greater than that predicted by the product of the permeability and the instantaneous surface slope. An equation is proposed for the velocity if the water surface is falling. The cosine of the slope angle of the path

of surface particles is a significant slope needed to correct the Darcy law for unsteady laminar flow. (Woodard-USGS)

THE STUDY OF COLLECTOR WELLS BY MEANS OF VISCOUS FLOW ANALOGY,
Technical Univ. of Istanbul (Turkey). Dept. of Hydraulics and Water Power.
Kazim Cecen, Eren Omay, and Aydeniz Siginer.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 367-376, 1969. 10 p, 5 fig, 1 tab, 7 ref.

Descriptors: *Groundwater movement, *Model studies, *Viscous flow, *Aquifer characteristics, Mathematical studies, Equations, Hydraulic conductivity, Soil profiles, Laminar flow, Diffusion, Boundaries (Surface), Laboratory tests, Velocity.
Identifiers: *Collector wells, *Analogy.

The hydraulics of horizontal collector wells completely penetrating the horizontal impervious base of an isotropic, homogeneous medium is studied by means of viscous flow analogy. The basic idea is to consider a well with an infinite number of collectors in an isotropic medium and an unconfined aquifer. The radial flow towards a horizontal well has been simulated by an apparatus, in which the distance between the plates varies exponentially, thus insuring similarity between the differential equations of the flow in the apparatus and in nature. The apparatus is checked by considering the problem of the gravity well. The free surface and the discharge are determined for the case of a vertical well, which has an infinite number of symmetrically distrubuted collectors and completely penetrates the horizontal impervious base of an unconfined aquifer. (Woodard-USGS)

NON-DARCY FLOW SOLVED BY FINITE ELEMENT ANALYSIS,
Windsor Univ., Ontario. Dept. of Civil Engineering.
J. A. McCorquodale, and H. C. Ng.
French resume. In: Proceedings 13th Congress of the International Association for Hydraulic Research, Kyoto, Japan, August 31-September 5, 1969, Vol 4 (Subject D), Science Council of Japan, Kyoto, p 347-355, 1969. 9 p, 2 fig, 4 ref.

Descriptors: *Groundwater movement, *Free surfaces, *Hydraulic conductivity, *Structural analysis, *Methodology, Mathematical studies, Equations, Flow, Seepage, Boundaries (Surfaces).
Identifiers: *Non-Darcy flow.

The finite element method is applied to the solution of non-Darcy flow with a free surface. An effective hydraulic conductivity for each element is defined in terms of the best available solution of the system. The introduction of the effective conductivity linearizes the system of simultaneous equations thus making it possible to obtain a better solution. A theoretical solution is compared with experimental results for flow through a rectangular section. (Woodard-USGS)

FOUR-POINT METHOD OF CHARACTERISTICS,
Technische Hogeschool, Delft (Netherlands).
Michael B. Abbott, and Adrianus Verwey.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY12, Paper 7763, p 2549-2564, December 1970. 16 p, 11 fig, 1 tab, 5 ref, 2 append.

Descriptors: *Computer programs, *Analog computers, *Open channel flow, Channel morphology, Numerical analysis, Unsteady flow, Waves (Water), Computer models, Mathematical models.
Identifiers: *Method of characteristics, Computer plotting.

Conservation laws in two independent variables have a four-point symmetry when expressed in normal or characteristic form. For nearly horizontal flows, this symmetry is notated and translated into easily programmed numerical operators. Simple starting and boundary subroutines are described. The output is especially well adapted to digital-analog plotting techniques, with an accuracy superior to any current difference scheme. Bed slopes and resistance terms can be easily introduced, but the method becomes less viable for general streamflows, with changes of channel section. (Knapp-USGS)

PERIODIC PERMANENT ROLL WAVES,
California Univ., Irvine. Dept. of Civil Engineering.
Richard R. Brock.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 96, No HY12, Paper 7764, p 2565-2580, December 1970. 16 p, 9 fig, 1 tab, 8 ref, append.

Descriptors: *Open channel flow, *Waves (Water), *Unsteady flow, *Supercritical flow, Sand waves, Bores, Surges, Model studies, Hydraulic models, Hydraulic jump.
Identifiers: *Open-channel shocks.

Two theories for periodic permanent roll waves are based on the shallow-water wave equations for the gradually varied portion of the wave profile, and the shock conditions for the rapidly varied portion. In the first theory the channel slope, S, is assumed to be sufficiently small that the weight of the shock can be neglected in the shock condition. Comparison of results from this theory for small S with experimental results reveals good agreement for S equals 0.019, but rather large discrepancies for S equals 0.050, 0.084, and 0.12. In the second theory the shock weight is included in the shock condition. Using the measured shock profiles to evaluate the weight of the shock yields theoretical predictions which are in substantial agreement with the experimental results. (Knapp-USGS)

P. H. Burgi.
Available from NTIS as PB-194 001, $3.00 in paper copy, $0.95 in microfiche. Report No REC-OCE-70-12, March 1970. 12 p, 9 fig, 4 tab.

Descriptors: Idaho.
Identifiers: *Sluice gates, Bafles, *Dams, Sluice gates, Hydraulic models, Sluices (Hydraulic engineering), Deterioration, Abrasion, Diverters, Flow distribution, Eddies, Jackson Lake (Wyoming), Jackson Lake dam.

Model studies of the Jackson Lake Dam sluice outlets were conducted to determine the effectiveness of the existing baffle blocks. Tests were run without baffle blocks with baffle blocks and with an end sill. Evaluation of the various configurations was based on scour patterns resulting from each test. Tests without baffle blocks resulted in a prohibitive scour pattern. The end sill yielded a slight improvement in the scour pattern over that of the existing baffle blocks. Sluice operating arrangements were suggested.

DETERMINING VOLUME AND PRESSURE OF ENTRAPPED AIR IN CONCRETE AND POROUS ROCK MATERIALS SATURATED WITH WATER,
Bureau of Reclamation, Denver, Colo.
M. Z. Simonov.
Available from NTIS as PB-193 659T, $3.00 in paper copy, $0.95 in microfiche. Translated from: Betonizhelezoleton No 5, p 35-36, 1969. Bur of Reclamation, Translation No 824, December 1969. 11 p.
Identifiers: *Concrete, Porosity, *Construction materials, Test methods, *Rock (Geology), Air, Water, Volume, Test equipment, USSR, Translations, Pore pressure, Aggregates (Materials).

Properties of lightweight concretes depend on the conditions for interaction between 2 capillary systems, one in the cement paste and the other in

the porous aggregate. Air is entrapped in concrete capillaries during movement of water in the aggregate capillaries from the periphery to the center or during unilateral contact of porous materials with water due to nonuniform water movement in capillaries of different diameters. A pressure gradient depending on the density increase in the cement paste develops in the contact between the cement paste and the aggregate. This phenomenon explains why lightweight concrete can have greater compressive strength and impermeability than ordinary concrete made under exactly comparable conditions. Pressure of entrapped air can significantly exceed 1 atm. This pressure is determined by computations based on experimental data. Apparatus and methods used to make the necessary measurements are described and then the computations given to convert them to values for the volume and pressure of entrapped air. This method can also be used to determine the actual total volume of interconnected (open) and closed pores and capillaries and the rate of water absorption for negative and atmospheric pressures.

FIRST PROGRESS REPORT ON EVALUATION OF REINFORCED PLASTIC MORTAR PIPE,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Carl E. Selander, Fred E. Causey, Amster K. Howard, Jr. and Kenneth B. Hickey.
Available from NTIS as PB-194 492, $3.00 in paper copy, $0.95 in microfiche. Report No REC-OCE-70-34, August 1970. 66 p, 13 tab, 36 fig, 7 ref.

Descriptors: Plastics, Elastomers, Polymers, *Pipes, Mortars, *Plastic pipes, Creep, Durability, Crushing, Fatigue (Mechanics), Laboratory tests, *Performance tests, Scale, Environmental tests, Field tests, Environmental effects, Resins, Strength, Deflection, Properties, Strain, Specifications.
Identifiers: *Pipe tests, Scale effect, Buried pipes, Glass reinforced plastics, *Reinforced plastic mortar pipe, Polyesters, Loading tests.

The report of the study comprises laboratory and field programs, and preparation of specifications and design. The laboratory program consists of (1) Series A - Basin Properties: (2) Series B - Scaling Factors; (3) Series C - Stiffness Correlations; and (4) Load tests on pipe buried in soil. The basic properties are being determined through fatigue, crush, burst, creep, and stiffness studies after exposure in environments of sulfuric acid, pH5; sodium hydroxide, pH9; synthetic soil extract pH7.4 to 8.2 tap water; and distrilled water. Controls and air specimens arae also being tested. Scaling factors are to computed from 12-, 24-, 36-, and 48-in. (30.48-, 60.96-, 91.44, and 121.92-cm) Class 60 irrigation pipe. Conclusions at this point are: (1) RPM pipe appears to follow the stress agin curve for plastics, (2) good stiffness correlation is shown between classes of irrigation pipe, (3) the Iowa Formula for flexible pipe design may require reevaluation for use with RPM pipe, and (4) changes in properties caused by the different environmental exposures appear to be similar, with good chemical resistance apparent.

GLASS-FIBER REINFORCED POLYESTER LINING,
Bureau of Reclamation, Denver, Colo. Office of Chief Engineer.
Michael E. Hickey.
Available from NTIS as PB-194 527, $3.00 in paper copy, $0.95 in microfiche. Report No REC-OCE-70-36, August 1, 1970. 12 p, 3 tab, 7 fig.

Descriptors:
Identifiers: *Canal linings, Reinforced plastics, *Polyester resins, Canal linings, Casting, Tensile strength, Leakage, Puncture resistance, Field tests, On site construction, *Glass fibers.

Information from an experimental field installation of onsite manufactured (cast-in-place) glass-fiber-reinforced polyester resin canal lining indicated that the lining as installed was not satisfactory. However, the process with further development has definite possibilities for canal lining. Laboratory tests of field test sections of cast-in-place and precast glass-fiber-reinforced polyester lining indicated that the material contained flaw areas of resin not saturating the glass mats, resulting in structural weakness and high water permeation. Test samples of flow-free areas showed that the lining was watertight, tough, strong, and similar to reinforced plastic structural panels used in roofing and skylight construction. Durability of the lining will be determined by periodic examinations of field test sections.

The objective of the International Summer Higher Hydrological Courses in Moscow is to familiarize the participants with the latest achievements of Soviet and foreign hydrology, with trends and ways of further development of a number of hydrological problems. Lectures will be delivered in the Russian language with simultaneous interpretation into English. Practical and laboratory studies will be conducted in Russian with interpretation into English. Curriculum for each academic year provides study of one of the most important problems in hydrology on the basis of the latest scientific achievements as well as consideration of further development of research. The most important hydrological subjects to be considered are the following: calculations of streamflow, hydrological forecasting, modern technique and measuring instruments used in hydrology, control of streamflow, and hydrophysical research into thermal conditions, evaporation, and phenomena and processes related to ice. Hydrological education in Czechoslovakia is briefly described. While undergraduate university education in hydrology is available, students have no interest in it. An undergraduate university education is also offered in Czechoslovakia in hydrogeology jointly with engineering geology. In this last field of specialization, the interest of students, and their prospects of employment, are considerably larger. On the other hand, a postgraduate and highly specialized education is considered as most important for the advancement of Czechoslovak hydrology. Thus, in addition to a regular postgraduate study leading to a doctor's degree, postgraduate courses of a duration of six months are being organized to help the training of highly qualified hydrologists. A Center of Applied Hydrology was set up at the Hydraulics Research Institute of the Federal University at Rio Grande do Sul, Brazil. This Institute is the largest Hydraulics laboratory in Brazil. The facilities include: a Coastal-Research Hall; a River Research Hall; a hall housing the large-scale canal for basic research in river morphology; a sedimentation laboratory; and the central building, which accommodates the administration, offices, library, lecture rooms, the teaching laboratory, two shops, etc. Undergraduate students in Civil Engineering, Mechanical Engineering, Chemical Engineering, Geology and Agricultural Sciences of the Federal University of Rio Grande do Sul do laboratory work in Fluid Mechanics and Hydraulics. The sub-professional training will prepare people for hydrological activities in general and for both field and office activities. The Center of Applied Hydrology will grant a diploma of Master of Science in Applied Hydrology. (Knapp-USGS)

HYDROLOGY IN COLOMBIA,
Universidad de los Andes, Bogota (Columbia). Center of Technical Studies and Investigations in Hydraulics.
Carlos Angulo.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1219-1224, published by Univ of Illinois, 1969. 6 p.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Planning, Projects, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *Colombia.

Columbia is in northern South America with coasts on both the Atlantic and the Pacific Oceans. Different climatic areas range from a tropical desert in the northeast with an annual precipitation of 4 inches to a tropical rainy zone along the Pacific Coast with an annual precipitation of 450 inches. The country is clearly divided in two zones: the mountainous western zone where 95% of Colombians live, and the completely undeveloped plains of the east. The Colombian Meteorologic and Hydrologic Service is at present studying the location of the existing Hydrometric Stations and will develop a national network. There are about ten universities offering the equivalent of a Bachelor's degree in Engineering in a five year course and two universities offering a Master's Degree in an additional year. Hydrology enters into the Civil Engineering Program as no university has a Department of Hydrology. Hydrology is taken as a compulsory course in most universities and includes a rainfall and streamflow data, evaporation and transpiration, groundwater, the unit hydrograph method, flood frequency analysis and reservoir planning. Urban Hydrology is usually included in a compulsory Sanitary Engineering course. (Knapp-USGS)

EDUCATION IN HYDROLOGY IN JAPAN,
Kyushu Univ., Fukuoka (Japan).
Masatugu Murakami.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1209-1218, published by Univ of Illinois, 1969. 10 p.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Planning, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *Japan.

Hydrology or related sciences are taught in Japan's Departments of Civil Engineering, Technical Engineering, Agricultural Civil Engineering, Forestry Engineering, Agriculture, Geophysics, Geography, Earth Science, Oceanography, and Biology. In some universities hydrological science is taught as a part in courses of water resources engineering, river engineering or water works engineering in the Department of Civil Engineering. In some Departments of Biology topics on water purification are included in applied freshwater biology. A group training course in groundwater resources development for groundwater technicians from Asian developing countries is held every year in Tokyo. Lectures are on hydrogeology, groundwater hydrology, well hydrology, physical prospecting, photo-geology and water quality. (Knapp-USGS)

HYDROLOGIC EDUCATION IN THE FEDERAL REPUBLIC OF GERMANY,
Technische Hochschule, Hanover (West Germany).
K. Lecher.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1191-1194, published by Univ of Illinois, 1969. 4 p.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Planning, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *Federal Republic of Germany.

In the universities of the Federal Republic of Germany hydrology does not exist as an independent course of studies. Lectures in hydrology are given within the frame of more general studies, such as in hydraulic constructions in the education of civil engineers, in the sciences of agriculture and forestry, in geography, in geophysics and via hydrogeology in the education of geologists; the hydrologic education is mainly aiming at the practical use, the so-called 'Applied Hydrology.' The consequence is that hydrologists come from all these special fields and that their hydrologic work is strongly characterized by their respective basic studies. (Knapp-USGS)

HYDROLOGIC EDUCATION IN AUSTRALIA AND NEW ZEALAND,
Lincoln Coll., Canterbury (New Zealand). Dept. of Agricultural Engineering.
J. R. Burton.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1156-1177, published by Univ of Illinois, 1969. 22 p, 7 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *Australia, *New Zealand.

Education in hydrology in Australia and New Zealand is summarized. Hydrology in Australia is largely the function of the civil engineer, and hydrologic teaching is almost entirely restricted to the engineering schools. Applied hydrology is first taught in undergraduate courses, and two schools in particular (the School of Civil Engineering of the University of New South Wales and the School of Agricultural Engineering of the University of Melbourne) provide more extensive teaching in the final undergraduate year, but serious specialization in hydrology and water resources technology is only available in postgraduate courses. The only significant postgraduate programs currently available in Australia are offered by the School of Civil Engineering of the University of New South Wales. The major university research effort in hydrology is centered at the University of New South Wales and its associated Water Research Laboratory. The major center for university research in water resources is the Agricultural Engineering Department of Lincoln College with the associated New Zealand Agricultural Engineering Institute. (Knapp-USGS)

HYDROLOGICAL EDUCATION IN THE UNITED KINGDOM,
Imperial Coll. of Science and Technology, London (England).
M. J. Hall.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1136-1155, published by Univ of Illinois, 1969. 20 p, 1 tab, 8 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *United Kingdom.

Although selected aspects of the subject are contained within the scope of most undergraduate courses in both civil engineering and geography, the teaching of hydrology in British universities is concentrated at postgraduate level. No university in the United Kingdom offers an undergraduate course leading to a degree in hydrology, but there are at present seven full-time postgraduate courses of from 9 to 12 months' duration devoted to water resources technology. Five of the seven courses are based in departments of civil engineering. No British university has a department of hydrology. An analysis of the numbers of students attending the above-mentioned courses during the four years 1965-69 has shown that three out of every five were from outside the United Kingdom. (Knapp-USGS)

HYDROLOGIC EDUCATION IN CANADA,
Saskatchewan Univ., Saskatoon. Dept. of Agricultural Engineering; and Saskatchewan Univ., Saskatoon. Div. of Hydrology.
Don M. Gray.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1125-1135, published by Univ of Illinois, 1969. 11 p, 2 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *Canada.

While training in specific areas of hydrology is offered at many Canadian Universities, this training is primarily at the graduate level and oriented consistent with the 'classic' Departmental Structure. Under this system, the primary responsibility of the student is to satisfy Departmental requirements for the degree more than to develop competence in his broad field of study. Excellent programs can be found at: University of British Columbia--Oceanography and Forest Hydrology, University of Alberta (Edmonton)--River Engineering, Queen's University and Ecole Polytechnique--Hydraulics, Guelph--Surface Hydrology. Different approaches being used within Canadian Universities to develop interdisciplinary scope in Hydrologic Education are summarized. (Knapp-USGS)

EDUCATION AND RESEARCH IN HYDROLOGY IN FRANCE,
National School of Bridges and Roads, Paris (France).
Jean J. Fried.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1109-1124, published by Univ of Illinois, 1969. 16 p, 1 fig.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *France.

Hydrological education in France is briefly summarized. Hydrology is taught the second or the third year in professional schools. It comprises basic hydrology and is developed according to the general trend of each school: for instance the 'Ecole des Ponts et Chaussees' (Bridges and roads) specializes in open-channel flow and urban hydrology. Students who enter the University take basic geology courses and have almost no theoretical courses such as mathematics; they are immediately specialized in geology and related fields, and after three or four years sit for the 'maitrise de geologie' (which is in between B.Sc. and M.Sc.). Most hydrological studies are taken after the 'maitrise', in the 'third cycle' and lead to doctorate theses. The third cycle courses are taught in the four main Universities; Paris, Bordeaux, Montpellier and Toulouse. Education in hydrology is still lagging far behind research; it is very academic without much field work and is somewhat neglected by the great engineering schools which provide the core of French scientists and engineers. These schools are, however, able to educate hydrologists with a sound base in theoretical topics, so that they can define and apply new theories and do rigorous experimental work. (Knapp-USGS)

HYDROLOGIC EDUCATION IN ISRAEL,
Technion - Israel Inst. of Technology, Haifa. Water Resources Research Center.
Jacob Bear.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1086-1108, published by Univ of Illinois, 1969. 23 p, 2 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Universities, *Training, Research and development, Manpower, Schools (Education), Geology, Water resources, Water resources development, Forecasting, Hydrology, Hydraulics, Engineering, Professional personnel, Scientific personnel, Planning, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education, *Israel.

The syllabi of courses in hydrology and some related subjects at the Technion - Israel Institute of Technology and at the Hebrew University of Jerusalem are listed. Courses are also offered at the Graduate School of the Weizmann Institute of Science especially in the field of geochemistry, isotope geology and the use of isotopes in hydrology. At the Technion, courses are given at the Departments of Civil Engineering and Agriculture Engineering. Both at the Technion and at the Hebrew University, the syllabi are dictated to a large extent by the courtry's present, and especially future needs. These needs also include training of hydrologists who will go and help develop water resources in developing countries, a task which Israel undertakes now in various parts of the world. Field trips which acquaint the student with actual problems are part of the educational programs, as are examples and exercises taken from the practice in Israel. Research in hydrology at the Technion and other Institutions of Higher Education has always been oriented towards solving pressing problems posed by the hydrologist and water resources planner in the field. Close cooperation exists between the staff at these institutions and the practicing engineers. (Knapp-USGS)

AN INTRODUCTION TO TERRESTRIAL HYDROLOGY - A GAP IN TRAINING,
National Academy of Sciences-National Research Council.
L. A. Heindl.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1079-1085, published by Univ of Illinois, 1969. 7 p.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Training, *Universities, Manpower, Research and development, Human resources, Schools (Education), Geology, Water resources, Water resources development, Hydrology, Hydraulics, Engineering, Planning, Research facilities, Laboratories, Technology, Computers.
Identifiers: *Water resources research, *Water resources education.

The need for and the possible content of a course in hydrology that would present the scientific and practical aspects of water studies at an early stage in the university curriculum are discussed. The purposes of the course would be to provide an introduction to hydrology and to its interrelationships with man's concern for his welfare and environment and to interest young students in careers in hydrology. The base for such a course would be the broad concept of hydrology as accepted by the University Council on Water Resources and the International Hydrological Decade, whose definitions of hydrology, in turn, are based on one offered by the Federal Council for Science and Technology. Under this concept hydrology is the science that treats of the waters of the earth, their occurrence, circulation and distribution, their chemical and physical properties, and their reaction with the environment including their relation to living things. This broad concept would be stressed. However, the main thrust of the course should be on the hydrology of land areas. (Knapp-USGS)

TEACHING AIDS AND HYDROLOGY,
Texas Univ., Austin. Dept. of Civil Engineering.
Walter L. Moore.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1044-1078, published by Univ of Illinois, 1969. 35 p, 1 fig, 2 append.

Descriptors: *International Hydrological Decade, *Conferences, *Bibliographies, *Education, *Reviews, Libraries, Research and development, Publications, Universities, Schools (Education), Water resources development, Hydrology, Hydraulics, Training, Laboratories, Computers, Research facilities.
Identifiers: *Water resources research, *Water resources education, *Textbooks.

The nature of teaching aids is reviewed in relation to the teaching and learning process; some particular forms of teaching aids are demonstrated, and potential uses of various aids for some subdivisions in hydrology are discussed. A list of current books available in the United States includes general books on hydrology which either include a treatment of the entire subject matter of hydrology or

some major portion of the topic. A much longer list giving information on books in other fields which include treatments of some specific and usually rather limited topics of hydrology and a list of books on physical oceanography is included. The number of motion pictures dealing specifically with hydrological subjects is quite limited. The role of the laboratory in teaching hydrology is yet to be developed. Equipment in conventional hydraulic laboratories are applicable to the teaching of some aspects of hydrology. (Knapp-USGS)

CURRICULUM DEVELOPMENT IN HYDROLOGY,
Arizona Univ., Tucson. Office of Hydrology and Water Resources.
Daniel D. Evans, and John W. Harshbarger.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1024-1043, published by Univ of Illinois, 1969. 20 p, 1 fig, 1 tab.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Training, *Manpower, Research and development, Human resources, Schools (Education), Universities, Water resources development, Hydrology, Hydraulics, Geology, Hydrogeology, Water resources, Engineering, Planning, Research facilities, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education.

Knowledge required for understanding and solving complex water problems may be considered as a continuum extending from the basic physical and biological sciences, through the applied natural sciences, and a thrust into the behavioral sciences. The breadth of knowledge encompassed is greater than in any other field of study. A complete educational program in hydrology and water resources needs to provide the opportunity for students to specialize in any segment of the continuum as well as the opportunity for others to obtain a general education across the continuum. In order to attempt to fully understand the manifold phases of the hydrologic cycle, the hydrologist must draw upon the knowledge of meteorology, geology, soil science, biology, and engineering, and make constant use of the fundamentals of chemistry, physics, mathematics and statistics. In the solution of everday water problems he needs to collaborate with engineers, economists and other scientists. To analyze problems in water resources involving man and society a scientist must have a basic understanding of hydrology, economics, social sciences, political science, water law, statistics, and operations research. Suggestions are offered for forming university curricula to meet those requirements at undergraduate and graduate levels. (Knapp-USGS)

COMMENTS ON SOME RECENT TRENDS IN HYDROLOGY RESEARCH,
Office of Water Resources Research, Washington, D.C.
E. D. Eaton.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1 st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 974-993, published by Univ of Illinois, 1969. 20 p, 14 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Research and development, *Education, *Research factilities, Water resources development, Forecasting, Hydrology, Hydraulics, Groundwater movement, Snow, Ice, Permafrost, Precipitation (Atmospheric), Planning, Projects, Soil water, Lakes, Soil-water-plant relationships, Laboratories, Model studies, Technology, Computers, Instrumentation, Mathematical studies, Systems analysis.
Identifiers: *Water resources research.

Some of the trends in current hydrology research are discussed including some of the research subjects likely to receive increasing attention in the coming years. All seem to relate to developing better understanding of, and better competence to deal with extensive, complex, multivariate systems; the research design and technology generally utilized are well suited to subjects so characterized. Scientific advances are providing powerful predictive tools. Two aspects of system-analysis type research especially require strengthening. One of these is improvement of the design of hydrology research on problems that are strongly influenced by biological and social factors which have the effect of making problem boundary conditions obscure and instable. A second aspect of system-analysis hydrology research that needs strengthening is the processes of appraising risk in situations affecting human life and well-being. (Knapp-USGS)

HYDROLOGIC TRAINING FOR WATER RESOURCES DEVELOPMENT,
Georgia Inst. of Tech., Atlanta. Water Resources Center.
Carl E. Kindsvater, and Willard M. Snyder.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 962-973, published by Univ of Illinois, 1969. 12 p, 1 tab, 2 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Manpower, *Professional personnel, Governments, Universities, Human resources, Hydrology, Scientific personnel, Planning, Projects, Research facilities, Laboratories.
Identifiers: *Water resources research, *Water resources education.

New university programs in hydrology are predominantly at the graduate level and they tend to attract an inordinately large number of mature students with a variety of job experiences. The result is an exceptionally responsive feed-back relationship between job requirements and educational programs. Training the hydrologist for water resources development implies training for technological, not scientific endeavor. The hydrologist is, however, a full-fledged professional, springing generally from a bachelor's-degree education in a field such as civil engineering, geology, or soil physics. Breadth in the hydrologist's training implies sufficient knowledge of the natural and social sciences to communicate effectively in an interdisciplinary environment. The hydrologist should have a solid foundation in modern operational mathematics, and he should have basic training in operations research, systems analysis, statistics and probability, and computer technology. The hydrologist must also be educated in considerable depth in all of the allied disciplines, including the auxiliary hybrids known as hydrometeorology and hydrogeology. (Knapp-USGS)

MANPOWER NEEDS IN HYDROLOGY,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
Arno T. Lenz.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 954-961, published by Univ of Illinois, 1969. 8 p, 1 tab.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Manpower, Universities, Governments, Engineering, Employment, Human resources, Hydrology, Professional personnel, Scientific personnel, Planning, Projects, Research facilities, Laboratories.
Identifiers: *Water resources research, *Water resources education.

The present manpower situation is reviewed with regard to needs in hydrologic education. Competence in hydrology requires at least minimal competence in one or more of the other earth sciences and the application of hydrology frequency involves the application of civil, hydraulic and sanitary engineering because water is such an important part of man's environment. Hydrologists have entered into broader fields, or scientists from broader fields now consider themselves hydrologists. Greater depth of concentration is also of increasing importance. The professional manpower needs of government agencies, universities, consulting firms, and other employers of hydrologists are briefly summarized. (Knapp-USGS)

INTERNATIONAL COOPERATION IN HYDROLOGIC EDUCATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
Maurice L. Albertson.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 938-953, published by Univ of Illinois, 1969. 16 p, 6 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Human resources, *Education, *Manpower, Training, Water resources development, Forecasting, Hydrology, Hydraulics, Planning, Projects, Research facilities, Exploration, Economics, Laboratories, Technology.
Identifiers: *Water resources research, *Water resources education.

International cooperation in education in general, and such cooperation in water resources or hydrologic education in particular are discussed, treating the concept of human resources development as more important than physical resources to developing countries. The sub-category of manpower resources must, of course, consider both quantity and quality of the manpower resource. The information resource is the body of knowledge available for all mankind, and the cultural resources include the over-all cultural background, as well as the institutional structure which is necessary for the manpower resource to be effective. Basically, the necessary human resources can be provided either from indigenous personnel or from human resources outside the country in question. Both sources of human resources must be drawn upon very heavily. (Knapp-USGS)

INTERNATIONAL HYDROLOGIC EDUCATION THROUGH FELLOWSHIPS AND ASSISTANTSHIPS,
Nevada Univ., Reno. Desert Research Inst.
William S. Butcher.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1011-1023, published by Univ of Illinois, 1969. 13 p, 4 ref.

Descriptors: *International Hydrological Decade, *Conferences, *Education, *Grants, Research and development, Schools (Education), Universities, Training, Governments, Water resources development, Hydrology, Hydraulics, Planning, Projects, Research facilities, Laboratories, Technology.

Identifiers: *Water resources research, *Water resources education.

The education and training program in the International Hydrological Decade occurs at national and international levels. At the international level, it has been possible to set up regional training centers, as well as training courses for hydrological technicians in some of the less developed countries, by working in cooperation with various other international organizations. Many countries, working through their own National Committees, have been able to achieve substantial progress in the education and training area. From the outset, education and training has been an important part of the concern of the US/IHD National Committee. Sources of support for foreign and U. S. students in hydrology are summarized. (Knapp-USGS)

HYDROLOGY IN TAIWAN,
National Taiwan Univ., Taipei. Dept. of Civil Engineering.
Yen-Chi Lu.
In: The Progress of Hydrology, Vol 3 - Hydrologic Education and Discussions, Proceedings 1st International Seminar for Hydrology Professors, Illinois University, Urbana, July 13-25, 1969, p 1195-1208, published by Univ of Illinois, 1969. 14 p, 1 fig, 3 tab.

Descriptors: *International Hydrological Decade, *Hydrogeology, *Conferences, *Water resources development, Climates, Topography, Research and development, Forecasting, Hydrology, Hydraulics, Precipitation (Atmospheric), Soil conservation, Land management, Planning, Projects, Research facilities, Exploration, Economics, Rainfall-runoff relationships, Education, Training, Laboratories, Technology.
Identifiers: *Water resources research, *Taiwan.

The physiography and hydrology of Taiwan are briefly summarized and the education in hydrology available there is outlined. The whole island is very mountainous, and only its western coastal plain is comparatively flat. Mountain slopes are steep. Rivers are short and rapid. The top soil containing gravel is shallow and easily eroded. In addition to natural factors which contribute to soil erosion, population pressure and the lack of knowledge of soil conservation among farmers make the situation even more serious. Research in recent years by hydrologists, meteorologists and hydraulic engineers in various organizations such as Taiwan Provincial Weather Bureau (TPWB); Water Resources Planning Commission (WRPC); Taiwan Power Company (TPC); Taiwan Provincial Water Conservancy Bureau (TPWCB); and Shihmen Reservoir Promotion Committee (SRPC) are described. One semester course of hydrology in the junior year is required of all civil engineering students. Several courses related to hydrology, such as water resources engineering, water supply, and sewerage engineering are available in the senior year. A two year graduate program in civil engineering was established in 1960 at the National Taiwan University, leading to a M.S. degree. There have been few students interested in specializing in hydrology. (Knapp-USGS)

Manpower considerations are most significant in determining the nature and extent of university educational programs. In all nations, whether developed or developing, and in certain disciplines, the educational effort often requires that emphasis be placed on mass production of 'how-to-do-it' graduates. As initial needs are met, the educational programs can devote appreciably more emphasis to scientific advancement via research and graduate instruction. University-government relations must be responsive to these changing conditions. There can be no fixed formula for appraising the adequacy of university relations with government agencies. Adequate communications and forthright appraisal of relative strengths and weaknesses are fundamental to the maintenance of satisfactory relations. Some general guidelines are suggested, but their application to specific cases must recognize the evolutionary processes that are ever present. (Knapp-USGS)

FISCAL 1970 ANNUAL REPORT.
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.

Institute for Research on Land and Water Resources, Information Report No 64, University Park, Pa., July 1970. 247 p, 2 append.

Descriptors: *Training, *Universities, *Education, Allotments, Grants, Acid streams, *Pennsylvania, Eutrophication, Water pollution, Waste water treatment, Carbonates, Hydrogeology, Watershed management, Phosphates, Water pollution sources, E. coli, Sewage effluents, Aquatic microbiology, Demand, Supply, Recreation, Social impact, Public lands, Zoning, Planning, Land use.
Identifiers: Highway economic impact, New land uses, Acquisition practices, Tourism, Soil productivity, Roadside ecology, Economic data systems.

This publication serves the dual purposes of being an annual report of the Institute and of satisfying the reporting requirements to the Office of the Water Resources Research under P.L. 88-379. Separate sections within the publication are devoted to the activities and research projects of

the Land Resources Center, Water Resources Center, and Regional Analysis Center. Indicating the interdisciplinary nature of the Institute are the 158 Institute personnel who represented 9 colleges and 27 academic departments at Penn State. Numerous broad lines of research are reported with concentrations in such areas as: pollution control; pollutant identification; renovation of waste water; management of watersheds to increase water yields; control of plant growth in streams; hydrologic and hydrogeologic studies; development of water supply and waste water systems to meet community and regional needs; highway economic impact; land use planning and zoning procedures; identification of new land uses for rural areas; development of equitable public land acquisition practices; social impact of water reservoir development; potentials of tourism and recreation; the development of computer programs for analyzing the growth potentials of economic regions; biological and engineering studies of land and water resources; economic efficiency studies; acid water neutralization; land suitability for septic tank disposal systems; soil productivity; roadside ecology; economic data systems; and costs of pollution in terms of recreation. Contains 2 appendices. (Sink-Penn State)

ANNUAL REPORT OF ACTIVITIES FOR FISCAL YEAR 1970,
Illinois Univ., Urbana. Water Resources Center.
Ben B. Ewing.
Annual Report No 6, July 11, 1970. 199 p.

Descriptors: Water resources, *Illinois, Training, *Universities, *Education, Allotments, Grants.
Identifiers: Water resources research, *Annual report.

The University of Illinois Water Resources Center was established in 1963 to 'encourage and coordinate university-wide planning and implementation of interdisciplinary programs for research and graduate education in water resources'. Since designation as the Title 1 OWRR 'Institute' for Illinois, the Center's activities have become statewide. This report describes research accomplishments and other activities of the Center during fiscal year 1970 and also describes plans for the remainder of the calendar year. The Center's programs are sponsored both under Title 1 of P.L. 88-379 and from other sources such as state funds. The Center's fiscal year 1970 research program included a total of 32 projects of which 13 were included in the annual allotment from OWRR, 14 were partially sponsored by matching grants from OWRR and 5 were completely sponsored with state funds. A progress report for each project is presented. (Ewing-Illinois)

TECHNICAL, INTELLIGENCE, AND PROJECT INFORMATION SYSTEM FOR THE ENVIRONMENTAL HEALTH SERVICE, VOLUME I. MANAGEMENT ASSISTANCE AND PLANNING,
Environmental Health Service, Rockville, Md.
D. L. Morrison, D. B. Menzel, K. L. Nielsen, A. A. Levin, and C. W. Hamilton.
Available from NTIS as PB-194 410, $3.00 in paper copy, $0.95 in microfiche. Final Report to Consumer Protection and Environmental Health Service, June 29, 1970. 83 p, 10 tab, 5 fig, 5 ref. HEW Contract CPS-69-005.
Identifiers: *Research management, Public health, *Project planning, *Public health, *Environments, Management, Management analysis, Management methods, Management planning, Pollution, Mathematical models, Forecasting, Information systems, Hazards, Hazardous materials, Monitoring, *Environmental health.

The concepts embodied in the development and implementation of a comprehensive R and D and program planning capability for EHS were examined. Environmental stressors were selected as the basis for planning rather than categorical approaches. For the mix of complex problems encountered by EHS, s system to establish priorities is required. The integrated planning system which was recommended utilizes mathematical models to assess the impacts of technology upon man and his environment and the assignment of priorities based upon quality of life indices. Specific elements of the management-assistance system which was defined include an overview environmental health planning function to provide coordinated and comprehensive planning in the man-centered ecosystem context; an impact assessment capability based upon a hierarchy of mathematical models; a threat identification function to identify and evaluate potential threats to man and the environment through intensification or extension of current use patterns of products and services or through introduction of new stressors; and an environmental health information network to provide a well-organized information base. A hierarchical approach to the development of mathematical models for prediction of the impacts of stressors upon man and the environment was described and specific examples are presented for lead in the environment. TECHNICAL INTELLIGENCE, AND PROJECT INFORMATION SYSTEM FOR THE ENVIRONMENTAL HEALTH SERVICE. VOLUME II. EHS INFORMATION NETWORK ANALYSIS,
Environmental Health Service, Rockville, Md.
Ralph L. Darby, Robert S. Kohn, Thomas E. Carroll, W. David Penniman, and David L. Morrison.
Available from NTIS as PB-194 411, $3.00 in paper copy, $0.95 in microfiche. Final Report to Consumer Protection and Environmental Health Service, June 29, 1970. 128 p, 23 tab, 15 fig, 38 ref. HEW Contract CPS-69-005.
Identifiers: *Information systems, *Environmental surveys, *Research management, Public health, *Project planning, *Public health, *Environments, Environmental engineering, Information retrieval, Surveillance, Monitors, Libraries, Resources, Thesauri, Data storage, Documentation, Computer programs, *Environmental health.

The study for the Environmental Health Service is an investigation of the problems being faced in protecting man's environment from threats created by man. This study included the following major efforts: (1) research and development planning in the perspective of man in his total environment, (2) information network analysis, and (3) model case studies. This volume of the report concerns itself with Information Network Analysis. An investigation was made of the existing EHS information resources including the monitoring and surveillance activities. A survey was conducted of the documentation systems and libraries in order to determine their operational characteristics as related to an information network. (See also W71-02290)
W71-02289

TECHNICAL, INTELLIGENCE, AND PROJECT INFORMATION SYSTEM FOR THE ENVIRONMENTAL HEALTH SERVICE. VOLUME III. LEAD MODEL CASE STUDY,
Environmental Health Service, Rockville, Md.
Garson A. Lutz, Arthur A. Levin, Sanford G. Bloom, Kaj L. Nielsen, and Jack L. Cross.
Available from NTIS as PB-194 412, $3.00 in paper copy, $0.95 in microfiche. Final Report to Consumer Protection and Environmental Health Service, June 29, 1970. 129 p, 26 tab, 17 fig, 500 ref. HEW Contract CPS-69-005.
Identifiers: *Air pollution, Lead (Metal), *Lead (Metal), *Pollution, *Public health, *Project planning, Public health, Toxicity, Ecology, Mathematical models, Hazards, Diseases, Economic analysis, Fuels, Sources, Air pollution, Environments, Research management, Children, Hazardous materials, *Environmental health.

The lead model case study was undertaken to serve as a working example and to evaluate the technical, intelligence, and project information system under consideration for EHS. Occurrence and use patterns for lead within the U. S. were examined. The major categories of uses in decreasing order were production of storage batteries and accessories, gasoline antinock additives, pigments, ammunition, solder, cable covering, and caulking lead. Leaded fuels are the major source of environmental lead. Pediatric plumbism, the most significant acute health problem, arises from lead used as a pigment. The economic aspect of this problem area were investigated. While lead is very slowly absorbed from environmental sources, its gradual accumulation in the body is the basis for progressive toxicity. Additional research is required to determine the chronic effects of lead in the environment on health, and better diagnostic and therapeutic techniques are needed in support of this research. A mathematical model was developed to represent the environmental transport of the stressor lead from several sources with the subsequent intake of lead by man. This model can be used to assess the impact of contemplated actions on lead body burdens, to define R and D requirements, and to identify the needs and locations for monitoring and surveillance. A categorized bibliography for lead is included. (See also W71-02291)
W71-02290

TECHNICAL, INTELLIGENCE, AND PROJECT INFORMATION SYSTEM FOR THE ENVIRONMENTAL HEALTH SERVICE. VOLUME IV. PESTICIDES MODEL CASE STUDY,
Environmental Health Service, Rockville, Md.
J. K. Yoss, J. W. Blaylock, M. J. Schneider, L. C. Schwendiman, and C. J. Touhill, Jr.
Available from NTIS as PB-194 413, $3.00 in paper copy, $0.95 in microfiche. Final Report to Consumer Protection and Environmental Health Service, June 29, 1970. 53 p, 16 tab, 9 fig, 91 ref. HEW Contract CPS-69-005.
Identifiers: *Air pollution, DDT, *Water pollution, *Pesticides, Pollution, *Public health, *DDT, *Project planning, Public health, Ecology, Hazards, Hazardous materials, Models, Chlorohydrocarbons, Sources, Air pollution, Water pollution, Environments, Toxicity, Environmental health.

DDT was selected as the compound for this study due to paucity of data regarding environmental effects of other classes of pesticides. Human exposure to pesticides was examined from two major pathways; the direct pathway which deals with direct uptake from primary sources of pesticide release, and the indirect pathway which involves human exposure by translocation through air, water, or food. Reductions in accidential poisonings could be made by limiting the total toxicant contents of home packages of pesticides, and means to reduce deaths from aerial applications warrant further study of this method of application. The control of human burden of pesticides by control of food residues is only partially effective since evidence on pesticide distribution in the environment suggests that about half of the intake is from inhalation of insecticide aerosols or dust laden with insecticides. There is presently no evidence that pesticide exposure directly shortens human life. Fish and birds are more sensitive to pesticides in the environment. Fish lack the basic microsomal oxidase enzyme systems which detoxify pesticides and birds appear to be very sensitive to the sterodal hormone mimicking effects of the chlorinated hydrocarbons. (See also W71-02292)

TECHNICAL, INTELLIGENCE, AND PROJECT INFORMATION SYSTEM FOR THE ENVIRONMENTAL HEALTH SERVICE. VOLUME V. DIRECTORY OF EHS INFORMATION FACILITIES WITH SELECTED SUPPLEMENTARY RESOURCES,
Environmental Health Service, Rockville, Md.
Ralph L. Darby, Robert S. Kohn, Thomas E. Carroll, W. David Penniman, and David L. Morrison.
Available from NTIS as PB-194 414, $3.00 in paper copy, $0.95 in microfiche. Final Report to Consumer Protection and Environmental Health Service, June 29, 1970. 62 p. HEW Contract CPS-69-005.
Identifiers: *Research management, Public health, *Project planning, Public health, *Public health, *Environments, *Information systems, Environmental surveys, Management methods, Management planning, Management environmental engineering, Information retrieval, Libraries, Resources, Surveillance, Monitors, *Environmental health.

This study is a multifaceted and intensive investigation of the problems facing the EHS in protecting man's environment from the threats created by man. This study included the following major efforts: (1) research and development planning in the perspective of man in his total environment, (2) information network analysis, and (3) model case studies. This directory represents an inventory of information and data resources useful to the personnel of the Environmental Health Service. It is divided into three principal categories: (1) EHS-sponsored resources, (2) non-EHS resources, and (3) monitoring and surveillance activities of both the National Air Pollution Control Administration. A subject-index, an index of information facilities, and an index of the parent or sponsoring organization are provided. (See also W71-02288)

BIBLIOGRAPHY OF MONTANA WATER RESOURCES AND RELATED PUBLICATIONS.
Montana Water Resources Board, Helena.

Montana Water Resources Board Inventory Series Report No 10, 1969. 91 p, 2 index, append.

Descriptors: *Bibliographies, *Water resources, *Montana, Documentation, Surface waters, Groundwater, Water supply, Water quality, Consumptive use, Water measurement.
Identifiers: Literature search.

This bibliography lists all of the known printed information, both published and unpublished, available to the Montana Water Resources Board as of December, 1968. It has been compiled as a part of the Inventory phase of the State Comprehensive Water and Related Land Resources Plan (State Water Plan). The bibliography is arranged in two sections and the material is coded so that it may be useful to researchers seeking references in any of a number of ways. The coding system is based upon the Descriptor Groups presented in the Water Resources Thesaurus published by the Office of Water Resources Research, U.S. Department of the Interior in November, 1966. Section 1, the author index, lists the complete reference alphabetically according to author. Also included are the complete code numbers for each reference. In Section 2, the code numbers are listed in sequence opposite the names of authors. With this list the researcher may locate all materials pertaining to a particular subject as listed in the Descriptor Groups in Appendix I. The list in section 2 also allows the researcher to easily segregate material on a specific river basin or county by examining the code in the second column. (Woodard-USGS)

SCHOOLS(EDUCATION)
INTERNATIONAL HIGHER SUMMER COURSES FOR INSTRUCTORS AND SPECIALISTS IN HYDROLOGY,
W71-02220 09A

SEA WATER
THE DISTRIBUTION OF PB, AG, SN, TL, AND ZN IN SEDIMENTS ON ACTIVE OCEANIC RIDGES,
W71-02436 02K

A DISPERSION MODEL FOR HEATED EFFLUENT FROM AN OCEAN OUTFALL,
W71-02605 05B

FAST-RESPONSE OXYGEN SENSOR TESTED.
W71-02676 05A

SEALERS
POLYSULFIDE CANAL CONTRACTION JOINT SEALER, LABORATORY TESTS TO DETERMINE THE EFFECT OF EARLY IMMERSION ON COAL-TAR EXTENDED POLYSULFIDE SEALER PLACED IN FRESH CONCRETE,

W71-02296 08G

SEASONAL PRICING
SOME PROBLEMS OF PRICING UNDER STOCHASTIC SUPPLY CONDITIONS THE CASE OF SEASONAL PRICING FOR WATER SUPPLY,
W71-02647 06C

SEDIMENT CONTROL
URBAN SOIL EROSION AND SEDIMENT CONTROL,
W71-02276 04D

SEDIMENT TRANSPORT
MOTION OF SINGLE PARTICLES IN ALLUVIAL CHANNELS,
W71-02208 02J

MUD VOLCANO CLAY, TRINIDAD, WEST INDIES,
W71-02213 02J

DISTRIBUTION AND TRANSPORTATION OF SUSPENDED SEDIMENT IN UPPER CHESAPEAKE BAY,
W71-02258 02L

SEDIMENTARY STRUCTURES
GROWTH PATTERNS OF DEEP-SEA FANS,
W71-02210 02L

MUD VOLCANO CLAY, TRINIDAD, WEST INDIES,
W71-02213 02J

SEDIMENTATION
SEDIMENTS AND SEDIMENTARY PROCESSES OF EASTERN MISSISSIPPI CONE, GULF OF MEXICO,
W71-02209 02J

GROWTH PATTERNS OF DEEP-SEA FANS,
W71-02210 02L

EFFECT OF DIAPIRISM ON SEDIMENTATION IN GULF OF MEXICO,
W71-02212 02L

BOTTOM STABILITY AND SEDIMENTARY PROCESSES AT LITTLE LAKE HARBOR, LAKE SUPERIOR,
W71-02293 02H

PROCEEDINGS OF THE NATIONAL CONFERENCE ON SEDIMENT CONTROL.
W71-02425 04D

STREAM SEDIMENT AN ENVIRONMENTAL PROBLEM,
W71-02443 04C

SEDIMENTATION MANUAL(ASCE)
SEDIMENT MEASUREMENT TECHNIQUES RESERVOIR DEPOSITS,
W71-02205 02J

SEDIMENTATION TANKS
AEROBIC DIGESTION OF DILUTED ANIMAL MANURE IN CLOSED SYSTEMS - TEMPORARY EXPEDIENT OR LONG RANGE SOLUTION,
W71-02712 05D

SEDIMENTOLOGY
SEDIMENT MEASUREMENT TECHNIQUES RESERVOIR DEPOSITS,
W71-02205 02J

SEDIMENTS
THE DISTRIBUTION OF PB, AG, SN, TL, AND ZN IN SEDIMENTS ON ACTIVE OCEANIC RIDGES,
W71-02436 02K

PHOSPHATE EXCHANGE WITH SEDIMENTS ITS ROLE IN THE PRODUCTIVITY OF SURFACE WATERS,
W71-02520 02H

SEEDLINGS
ANALYSIS OF THE DUAL ACTION OF WHITE LIGHT ON GERMINATION OF ATRIPLEX DIMORPHOSTEGIA (CHENOPODIACEAE),
W71-02500 02I

THE EFFECT OF WATER STRESS ON THE POLYSOME POPULATION AND THE ABILITY TO INCORPORATE AMINO ACIDS IN MAIZE ROOT TIPS,
W71-02512 02I

SEEPAGE
WYNN V WILSON (SEEPAGE FROM IMPROPERLY CAPPED OIL WELL ALLEGED TO HAVE DAMAGED SPRING AND LAND).
W71-02372 06E

LOCATING AND TRACING SEEPAGE WATER IN UNSTABLE SLOPES,
W71-02522 04A

SEISMIC STUDIES
EFFECT OF DIAPIRISM ON SEDIMENTATION IN GULF OF MEXICO,
W71-02212 02L

SOME LIMITATIONS OF SEISMIC REFRACTION METHODS IN GEOHYDROLOGICAL SURVEYS OF DEEP ALLUVIAL BASINS,
W71-02446 02F

SEMIARID CLIMATES
WATER-RESOURCES INVENTORY SPRING 1968 TO SPRING 1969--ANTELOPE VALLEY-EAST KERN WATER AGENCY AREA, CALIFORNIA,
W71-02455 02E

SEMINOLE COUNTY(FLA)
FLOOD PLAIN INFORMATION, LITTLE WEKIVA RIVER, SEMINOLE COUNTY, FLORIDA.
W71-02457 04A

SEPARATION TECHNIQUES
SEPARATION OF PHENOLIC COMPOUNDS FROM CARBON CHLOROFORM EXTRACT FOR INDIVIDUAL CHROMATOGRAPHIC IDENTIFICATION AND MEASUREMENT,
W71-02680 05A

SERVITUDES
PRUYN V NELSON BROS (BATTURE LAND SUBJECT TO PUBLIC SERVITUDE FOR USE IN CONSTRUCTING AND REPAIRING LEVEES).
W71-02362 06E

CALDWELL V GORE (INTERSTATE SURFACE RUNOFF LOWER SERVITUDE).
W71-02403 06E

BEECHLEY V HARMS (INJUNCTION AGAINST INTERFERENCE WITH NATURAL DRAINAGE).
W71-02416 06E

SETTLING TANK
FARM WASTE DISPOSAL FIELD STUDIES UTILIZING A MODIFIED PASVEE OXIDATION DITCH, SETTLING TANK, LAGOON SYSTEM,
W71-02724 05D

SETTLING VELOCITY
A COMPUTER PROGRAM FOR THE CALCULATION OF HYDROMETER SIZE ANALYSIS,
W71-02215 07C

SEWAGE
REGIONAL WATER AND SEWERAGE FACILITIES PLAN 1990.
W71-02611 05D

WISCONSIN V ILLINOIS (INJUNCTION STAYING DIVERSION OF WATER FROM LAKE MICHIGAN).
W71-02613 06E

SEWAGE EFFLUENTS
NUTRIENT REMOVAL FROM ENRICHED WASTE EFFLUENT BY THE HYDROPONIC CULTURE OF COOL SEASON GRASSES,
W71-02277 05D

THE DETERMINATION OF CYANIDE IONS IN WATERS AND EFFLUENTS BY AN AUTO-ANALYZER PROCEDURE,
W71-02674 05A

SEWAGE SEEDING
TYPICAL VARIATIONS ENCOUNTERED IN THE MEASUREMENT OF OXYGEN DEMAND OF ANIMAL WASTES,
W71-02738 05A

SEWAGE TREATMENT
SHERIFF V CITY OF EASLEY (RIGHT TO FLOW OF UNCONTAMINATED STREAM THROUGH PRIVATE PROPERTY).
W71-02273 06E

METROPOLITAN PLANNING GUIDELINES, SEWAGE TREATMENT (FACILITIES).
W71-02284 05D

SHEATH NEMATODE
INFLUENCE OF SOIL TEMPERATURE, IRRIGATION AND AERATION ON HEMICYCLIOPHORA ARENARIA,
W71-02517 02I

SHEEP
GRAZING STUDIES IN THE ARID AND SEMI-ARID ZONES OF RAJASTHAN. VII UTILIZATION OF VEGETATION COVER, GRAZING BEHAVIOUR OF SHEEP AND SEASONAL VARIATION OF CRUDE PROTEIN CONTENT OF PLANTS IN DIFFERENT PASTURES,
W71-02501 03F

SHELLFISH
HYDROCARBON POLLUTION OF EDIBLE SHELLFISH BY AN OIL SPILL,
W71-02475 05C

SHERMAN COUNTY(KAN)
DIGITAL SIMULATION OF THE OGALLALA AQUIFER IN SHERMAN COUNTY, KANSAS,
W71-02454 02F

SHIPS
ANGOLA TRANSFER CO V TEXAS AND P RY (LIABILITY FOR DAMAGES FOR SHIP SUNK BY RAILROAD BRIDGE PROJECTION).
W71-02576 06E

SIEROZEMS
BROWN STEPPE SOIL IN THE UPPER PART OF WADI EATEL (NORTHWEST TRIPOLITANIA),
W71-02502 02G

SLATTED FLOOR
STUDY OF THE USE OF THE OXIDATION DITCH TO STABILIZE BEEF ANIMAL MANURES IN COLD CLIMATE,
W71-02722 05D

SLOPE STABILITY
MECHANICS OF DEBRIS AVALANCHING IN SHALLOW TILL SOILS OF SOUTHEAST ALASKA,
W71-02306 02J

SLUICE GATES
HYDRAULIC MODEL STUDIES OF JACKSON LAKE DAM BAFFLE BLOCKS,
W71-02626 08B

SLURRIES
SPECIFICATIONS FOR EQUIPMENT FOR LIQUID MANURE DISPOSAL BY THE PLOW-FURROW-COVER METHOD,
W71-02716 05E

SNOW COVER
SNOWFALL, SNOWFALL FREQUENCIES, AND SNOW COVER DATA FOR NEW ENGLAND,
W71-02303 02B

NOWFALL
SNOWFALL, SNOWFALL FREQUENCIES, AND SNOW COVER DATA FOR NEW ENGLAND,
W71-02303 02B

NOWPACKS
SNOW COVER ON THE TERRITORY OF THE USSR AS A WATER BALANCE ELEMENT,
W71-02253 02A

OCIAL ASPECTS
BENEFIT-COST ANALYSIS AND DEMAND CURVES FOR PUBLIC GOODS,
W71-02636 06B

THE SALT RIVER PROJECT OF ARIZONA ITS ORGANIZATION AND INTEGRATION WITH THE COMMUNITY,
W71-02667 06B

OCIAL WELFARE
THE WELFARE EFFECTS OF ZERO PRICING ON PUBLIC GOODS,
W71-02635 06C

ODIUM
THE CATIONS OF THE COTTON PLANT IN SODIUM SUBSTITUTED POTASSIUM DEFICIENCY,
W71-02504 02I

EFFECT OF TEMPERATURE AND PH ON SODIUM TRANSLOCATION AND SODIUM EXCHANGE REACTIONS IN BUSH BEANS,
W71-02506 02G

ODIUM EXCHANGE REACTIONS
EFFECT OF TEMPERATURE AND PH ON SODIUM TRANSLOCATION AND SODIUM EXCHANGE REACTIONS IN BUSH BEANS,
W71-02506 02G

ODIUM SUBSTITUTION
THE CATIONS OF THE COTTON PLANT IN SODIUM SUBSTITUTED POTASSIUM DEFICIENCY,
W71-02504 02I

OIL CHEMISTRY
A STUDY OF THE HAMRA SOIL ASSOCIATION OF ISRAEL,
W71-02519 02G

OIL CLASSIFICATIONS
SOIL CATENA CONCEPT FOR HYDROLOGIC INTERPRETATIONS,
W71-02442 02G

OIL DENSITY
PROBLEMS OF DETERMINATION OF SOIL DENSITY AND MOISTURE PROPERTIES FROM NATURAL CLODS,
W71-02507 02G

OIL DISPOSAL FIELDS
HYDROLOGY OF SPRAY-RUNOFF WASTE WATER TREATMENT,
W71-02437 05D

OIL EROSION
URBAN SOIL EROSION AND SEDIMENT CONTROL,
W71-02276 04D

STUDY OF EROSION IN ROADSIDE DRAINAGE CHANNELS IN NORTH CAROLINA,
W71-02525 04A

OIL FILTER
CHEMICAL ASPECTS OF ODOR REMOVAL IN SOIL SYSTEMS,
W71-02735 05D

OIL FORMATION
SOIL GEOGRAPHY AND FACTORS OF SOIL FORMATION IN AFGHANISTAN,
W71-02503 02G

OIL GEOGRAPHY
SOIL GEOGRAPHY AND FACTORS OF SOIL FORMATION IN AFGHANISTAN,
W71-02503 02G

OIL MICROMORPHOLOGY
GILGAI IN THE QUATERNARY,
W71-02505 02G

OIL MOISTURE
PROBLEMS OF DETERMINATION OF SOIL DENSITY AND MOISTURE PROPERTIES FROM NATURAL CLODS,
W71-02507 02G

DETERMINING WATER CONTENT OF DIFFERENT SOILS BY THE NEUTRON METHOD,
W71-02515 02G

OIL MOISTURE METERS
DETERMINING WATER CONTENT OF DIFFERENT SOILS BY THE NEUTRON METHOD,
W71-02515 02G

OIL PHYSICAL PROPERTIES
SOIL CATENA CONCEPT FOR HYDROLOGIC INTERPRETATIONS,
W71-02442 02G

BROWN STEPPE SOIL IN THE UPPER PART OF WADI EATEL (NORTHWEST TRIPOLITANIA),
W71-02502 02G

GILGAI IN THE QUATERNARY,
W71-02505 02G

OIL PHYSICS
GILGAI IN THE QUATERNARY,
W71-02505 02G

AVERAGE ENTITIES IN KINEMATICS AND THERMODYNAMICS OF POROUS MATERIALS,
W71-02518 02F

A STUDY OF THE HAMRA SOIL ASSOCIATION OF ISRAEL,
W71-02519 02G

SOIL PRESSURE
PROBLEMS OF DETERMINATION OF SOIL DENSITY AND MOISTURE PROPERTIES FROM NATURAL CLODS,
W71-02507 02G

SOIL PROFILES
SOIL GEOGRAPHY AND FACTORS OF SOIL FORMATION IN AFGHANISTAN,
W71-02503 02G

SOIL SUCTION
PROBLEMS OF DETERMINATION OF SOIL DENSITY AND MOISTURE PROPERTIES FROM NATURAL CLODS,
W71-02507 02G

INFLUENCE OF SOIL TEMPERATURE, IRRIGATION AND AERATION ON HEMICYCLIOPHORA ARENARIA,
W71-02517 02I

SOIL SURVEYS
BROWN STEPPE SOIL IN THE UPPER PART OF WADI EATEL (NORTHWEST TRIPOLITANIA),
W71-02502 02G

SOIL TEMPERATURE
INFLUENCE OF SOIL TEMPERATURE, IRRIGATION AND AERATION ON HEMICYCLIOPHORA ARENARIA,
W71-02517 02I

SOIL TYPES
SPECIALIZATION OF AGRICULTURE IN RELATIVELY SIMILAR NATURAL ENVIRONMENTS OF THE USSR AND THE UNITED STATES,
W71-02510 03F

SOIL WATER MOVEMENT
FILTRATION CALCULATIONS OF HORIZONTAL AND VERTICAL DRAINAGES IN NON-UNIFORM STRATIFIED SOILS,
W71-02270 02G

SOIL CATENA CONCEPT FOR HYDROLOGIC INTERPRETATIONS,
W71-02442 02G

NUMERICAL SOLUTIONS FOR THE RADICAL SUBSURFACE FLOW PROBLEM,
W71-02444 02G

SOIL-PLANT-WATER RELATIONSHIPS
THE CATIONS OF THE COTTON PLANT IN SODIUM SUBSTITUTED POTASSIUM DEFICIENCY,
W71-02504 02I

SOIL-WATER RELATIONSHIPS
DETERMINING WATER CONTENT OF DIFFERENT SOILS BY THE NEUTRON METHOD,
W71-02515 02G

AVERAGE ENTITIES IN KINEMATICS AND THERMODYNAMICS OF POROUS MATERIALS,
W71-02518 02F

A STUDY OF THE HAMRA SOIL ASSOCIATION OF ISRAEL,
W71-02519 02G

SOIL-WATER-PLANT RELATIONSHIPS
ANALYSIS OF THE DUAL ACTION OF WHITE LIGHT ON GERMINATION OF ATRIPLEX DIMORPHOSTEGIA (CHENOPODIACEAE),
W71-02500 02I

SOIL GEOGRAPHY AND FACTORS OF SOIL FORMATION IN AFGHANISTAN,
W71-02503 02G

EFFECT OF TEMPERATURE AND PH ON SODIUM TRANSLOCATION AND SODIUM EXCHANGE REACTIONS IN BUSH BEANS,
W71-02506 02G

ATMOSPHERIC-AND SOIL-INDUCED WATER STRESSES IN PLANTS AND THEIR EFFECTS ON TRANSPIRATION AND PHOTOSYNTHESIS,
W71-02508 02D

SOLUBILITY
POLYCHLORINATED BIPHENYLS (PCB) SOLUBILIZED IN WATER BY NONIONIC SURFACTANTS FOR STUDIES OF TOXITY TO AQUATIC ANIMALS,
W71-02682 05C

SOUNDING
ABOVE-BOTTOM ACOUSTIC REFLECTIONS, MISSISSIPPI RIVER DELTA,
W71-02211 02L

THE ROCK AND BONG TECHNIQUES OF MEASURING WATER LEVELS IN WELLS,
W71-02445 07B

SOUTH CAROLINA
SHERIFF V CITY OF EASLEY (RIGHT TO FLOW OF UNCONTAMINATED STREAM THROUGH PRIVATE PROPERTY).
W71-02273 06E

PORT UTIL COMM'N V MARINE OIL CO (LIABILITY FOR RENT WHERE WATER DEPTH NOT MAINTAINED).
W71-02323 06E

HAYS V HOFFMAN (OBSTRUCTION OF DRAINAGE DITCH ALLEGED TO HAVE CAUSED OVERFLOW).
W71-02380 06E

TAYLOR V LEXINGTON WATER POWER CO (NEGLIGENT RELEASE OF FLOODWATERS FROM DAM).
W71-02381 06E

FAIREY V SOUTHERN RY (RAILROAD EMBANKMENT ALLEGED TO HAVE DAMMED SURFACE RUNOFF).
W71-02382 06E

HUGGINS V ATLANTIC COAST LINE RR (RAILROAD FILL ALLEGED TO HAVE CAUSED FLOODWATER DAMAGE).
W71-02385 06E

SOUTH DAKOTA
SEEK DATA IN FEEDLOT RESEARCH.
W71-02694 05A

SPAIN
HYDROLOGIC EDUCATION IN SPAIN,
W71-02222 09A

SPECTROPHOTOMETRY
AUTOMATE KJELDAHL ANALYSES OF NITROGENOUS MATERIALS IN AQUEOUS SOLUTIONS,
W71-02439 02K

A RAPID, NONDESTRUCTIVE TECHNIQUE FOR INFRARED IDENTIFICATION OF CRUDE OILS BY INTERNAL REFLECTION SPECTROMETRY,
W71-02673 05A

POLYCHLORINATED BIPHENYLS (PCB) SOLUBILIZED IN WATER BY NONIONIC SURFACTANTS FOR STUDIES OF TOXITY TO AQUATIC ANIMALS,
W71-02682 05C

SPRINGS
WILLARD V STONE (EASEMENT FOR WATER SUPPLY MEANS REASONABLE USE OF ALL WATER ON SERVIENT PROPERTY).
W71-02329 06E

WYNN V WILSON (SEEPAGE FROM IMPROPERLY CAPPED OIL WELL ALLEGED TO HAVE DAMAGED SPRING AND LAND).
W71-02372 06E

HORNICK V BETHLEHEM MINES CORP (LIABILITY FOR DRYING UP OF SPRINGS RESULTING FROM UNDERGROUND MINING).
W71-02417 06E

CITY OF SCOTTSVILLE V HEWITT (COVENANT TO PROVIDE WATER NOT EXTINGUISHED BY ACT OF GOD).
W71-02659 06E

SPRINKLER IRRIGATION
HYDROLOGY OF SPRAY-RUNOFF WASTE WATER TREATMENT,
W71-02437 05D

DISPOSAL OF DAIRY CATTLE WASTES BY AERATED LAGOONS AND IRRIGATION,
W71-02720 05D

STAGE-DISCHARGE RELATIONS
ERROR CRITERIA IN WATER SURFACE PROFILE COMPUTATIONS,
W71-02201 02E

STANDARDS
ENGINEERING ASPECTS OF THERMAL POLLUTION.
W71-02478 05C

WATER QUALITY STANDARDS FOR TEMPERATURE,
W71-02480 05A

STANDARDS FOR PLANNING WATER AND LAND RESOURCES.
W71-02665 06B

STARFISH
A PREDATOR-PREY RELATIONSHIP. SEA STARS-BIVALVES. THE CHEMICAL BASIS OF THE RESPONSE OF ASTERIAS VULGARIS TO CRASSOSTREA VIRGINICA. A BIOASSAY, ITS APPLICATIONS AND THE PARTIAL PURIFICATION OF AN ACTIVE EXTRACT,
W71-02477 05C

STATE GOVERNMENTS
LEITCH V CITY OF CHICAGO (FEDERAL JURISDICTION OF CASES INVOLVING NAVIGABLE STREAMS).
W71-02387 06E

MACRUM V BOARD OF SUP'RS (AUTHORITY OF LOCAL GOVERNMENTS TO BRIDGE NAVIGABLE WATERS).
W71-02476 06E

CITY OF MADISON V SCHOTT (TITLE TO BED OF NAVIGABLE LAKE).
W71-02557 06E

PEOPLE V FOOTE (STATE OWNERSHIP OF BEDS).
W71-02565 06E

STATE JURISDICITION
LIPSCOMB V GALOURAKIS (STATE AND COUNTY JURISDICTION TO REGULATE THE TAKING OF SPONGES IN GULF WATERS).
W71-02350 06E

STATE JURISDICTION
MACRUM V HAWKINS (REGULATION OF BRIDGE CONSTRUCTION).
W71-02473 06E

ERBSLAND V VECCHIOLLA (JURISDICTION OF CITY TO ENFORCE ZONING ORDINANCE IN NAVIGABLE HARBOR).
W71-02533 06E

NIAGARA FALLS POWER CO V WATER POWER AND CONTROL COMM'N (POWER OF STATE TO REGULATE DIVERSION OF NAVIGABLE WATERS).
W71-02591 06E

STATISTICAL MODELS
GENERAL SCHEME FOR CALCULATING THE WATER BALANCE OF CLOSED INLAND SEAS AND LAKES BY THE METHOD OF STATISTICAL MODELLING,
W71-02461 02H

STIRRING
UNDER-CAGE MANURE DRYING SYSTEM SOLVES ODOR PROBLEMS,
W71-02696 05D

STOCHASTIC PROCESSES
SOME PROBLEMS OF PRICING UNDER STOCHASTIC SUPPLY CONDITIONS THE CASE OF SEASONAL PRICING FOR WATER SUPPLY,
W71-02647 06C

STOKES LAW
A COMPUTER PROGRAM FOR THE CALCULATION OF HYDROMETER SIZE ANALYSIS,
W71-02215 07C

STORAGE
REPORT ON FOURMILE RUN FLOODING, ALEXANDRIA, VIRGINIA.
W71-02286 08A

PROBLEMS AND PRACTICES IN SOME SYSTEMS OF MANURE HANDLING IN NORTHERN EUROPE,
W71-02732 05D

STORM DRAINS
CHELTENHAM AND ABINGTON SEWERAGE CO V PUBLIC SERVICE COMM'N (OWNERSHIP OF STORM DRAINAGE SYSTEM).
W71-02309 06E

STORM RUNOFF
FLOOD PLAIN INFORMATION, CITY OF ALEXANDRIA AND ARLINGTON COUNTY, VIRGINIA, FOURMILE RUN.
W71-02285 04A

REPORT ON FOURMILE RUN FLOODING, ALEXANDRIA, VIRGINIA.
W71-02286 08A

STRATIFICATION
MECHANICS OF CONDENSER WATER DISCHARGE FROM THERMAL POWERPLANTS,
W71-02482 05D

STRATIFIED FLOW
SEAWATER INTRUSION LENGTH IN STRATIFIED ESTUARIES,
W71-02435 02L

STREAMFLOW
ERROR CRITERIA IN WATER SURFACE PROFILE COMPUTATIONS,
W71-02201 02E

WATER RESOURCES DATA FOR COLORADO 1969 PART 1. SURFACE WATER RECORDS.
W71-02246 07C

STREAMS
TRITIUM IN STREAMS IN THE UNITED STATES, 1961-1968,
W71-02434 05B

CLARK V PIGEON IMPROVEMENT SLIDE AND BOOM CO (FREE AND OPEN COMMERCE OF CANADA-UNITED STATES BOUNDARY STREAMS REQUIRED BY TREATY).
W71-02675 06E

STREET DEICING
LAKE STRATIFICATION CAUSED BY RUNOFF FROM STREET DEICING,
W71-02441 05B

STREET SALTING
LAKE STRATIFICATION CAUSED BY RUNOFF FROM STREET DEICING,
W71-02441 05B

STRIP MINES
INVESTIGATIVE MINE SURVEY OF A SMALL WATERSHED, A FIELD INVESTIGATION TO LOCATE AND DEFINE UNKNOWN OR HIDDEN DRIFT MINE OPENINGS IN THE BROWNS CREEK WATERSHED OF THE WEST FORK RIVER IN WEST VIRGINIA.
W71-02275 05G

STRUCTURAL ANALYSIS
NON-DARCY FLOW SOLVED BY FINITE ELEMENT ANALYSIS,
W71-02267 08B

STRUCTURAL DEMAND
RECREATION DEMAND FUNCTIONS AND THE IDENTIFICATION PROBLEM,
W71-02643 06B

STRUCTURAL GEOLOGY
EFFECT OF DIAPIRISM ON SEDIMENTATION IN GULF OF MEXICO,
W71-02212 02L

MUD VOLCANO CLAY, TRINIDAD, WEST INDIES,
W71-02213 02J

STRUCTURES
ROSITZKY V BURNES (FLOOD DAMAGE TO ADJACENT BUILDING CAUSED BY OVERFLOW FROM ROOF).
W71-02401 06E

SUBSURFACE DRAINAGE
PERFORMANCE OF AN ASPHALT TREATED DRAINAGE BLANKET IN A FLEXIBLE PAVEMENT SECTION,
W71-02523 04A

SUBSURFACE STRUCTURES
TUNNEL BORING TECHNOLOGY, DISK CUTTER EXPERIMENTS IN

SEDIMENTARY AND METAMORPHIC ROCKS,
W71-02627 08A

ETROPIC
COMMENTS ON WATER BUDGET INVESTIGATIONS, ESPECIALLY IN TROPICAL AND SUBTROPICAL MOUNTAIN REGIONS,
W71-02465 02A

PERCRITICAL FLOW
PERIODIC PERMANENT ROLL WAVES,
W71-02432 08B

COMPUTATION OF OPEN-CHANNEL SURGES AND SHOCKS,
W71-02433 02E

PERVISORY CONTROL(POWER)
MACRUM V BOARD OF SUP'RS (AUTHORITY OF LOCAL GOVERNMENTS TO BRIDGE NAVIGABLE WATERS).
W71-02476 06E

SEWELL V ARUNDEL CORP (TAXPAYERS DO NOT HAVE STANDING TO INTERFERE WITH SUCH WORKS AS CONGRESS HAS AUTHORIZED TO IMPROVE NAVIGABLE WATERS).
W71-02539 06E

PPLY CONTRACTS
CITY OF SCOTTSVILLE V HEWITT (COVENANT TO PROVIDE WATER NOT EXTINGUISHED BY ACT OF GOD).
W71-02659 06E

RFACE DRAINAGE
CENTRAL OF GEORGIA RY V FAULKNER (LIABILITY FOR CHANGE IN EXISTING DRAINAGE PATTERN).
W71-02337 06E

CALDWELL V GORE (DUTY OF LOWER ESTATE TO ACCEPT NATURAL DRAINAGE FROM UPPER ESTATE).
W71-02349 06E

FORKNER V CHESAPEAKE AND O RY (RESTORATION OF NATURAL DRAINAGE COURSE BY CULVERT).
W71-02396 06E

FRANK V DIERSON (LIABILITY FOR ALTERATION OF NATURAL DRAINAGE DIRECTION).
W71-02398 06E

BUSH V CITY OF ROCHESTER (LIABILITY FOR EXPULSION OF SURFACE WATERS UPON LAND OF ANOTHER BY CONSTRUCTION OF A ROAD).
W71-02412 06E

STUDY OF EROSION IN ROADSIDE DRAINAGE CHANNELS IN NORTH CAROLINA,
W71-02525 04A

WINCHESTER V BYERS (LIABILITY FOR ALTERING NATURAL FLOW OF SURFACE DRAINAGE).
W71-02527 06E

MARKLE V GROTHE (COLLECTION AND DISCHARGE OF SURFACE WATER).
W71-02529 06E

RHINES V COMMISSIONERS OF CHATHAM COUNTY (COUNTY'S LIABILITY FOR OVERFLOWING LAND).
W71-02546 06E

HENRY V CHICAGO, B AND O RR (PROXIMATE CAUSE OF FLOOD DAMAGE).
W71-02553 06F

COLUMBUS AND GREENVILLE RY V TAYLOR (RIGHT OF RAILROAD TO OBSTRUCT SURFACE DRAINAGE).
W71-02560 06E

CITY OF MOBILE V LARTIGUE (SERVIENT LAND MUST ACCEPT ONLY WATER FLOWING NATURALLY THERETO FROM DOMINENT ESTATE).
W71-02564 06E

URFACE ENERGY
COMMENTS ON WATER BUDGET INVESTIGATIONS, ESPECIALLY IN TROPICAL AND SUBTROPICAL MOUNTAIN REGIONS,
W71-02465 02A

URFACE INFLOW
METHODS FOR THE COMPUTATION OF WATER BALANCE OF RESERVOIRS,
W71-02460 07C

URFACE RUNOFF
CHELTENHAM AND ABINGTON SEWERAGE CO V PUBLIC SERVICE COMM'N (OWNERSHIP OF STORM DRAINAGE SYSTEM).
W71-02309 06E

ZOOK V CITY OF LOUISIANA (BLOCKAGE OF DRAIN CAUSED BY CITY'S PAVING OF STREET).
W71-02369 06E

FRANK V DIERSON (LIABILITY FOR ALTERATION OF NATURAL DRAINAGE DIRECTION).
W71-02398 06E

WALTER V WAGNER (FLOOD DAMAGE CAUSED BY LANDFILL).
W71-02399 06E

KIGER V SANKO (DAMAGE CAUSED BY EXCESSIVE SURFACE RUNOFF).
W71-02400 06E

BEECHLEY V HARMS (INJUNCTION AGAINST INTERFERENCE WITH NATURAL DRAINAGE).
W71-02416 06E

HARRIS MOTOR CO V PULASKI FURNITURE CO (LIABILITY FOR DAMAGE CAUSED BY REPULSION OF SURFACE WATER BY CONSTRUCTION OF BUILDING).
W71-02543 06E

CITY OF MOBILE V LARTIGUE (SERVIENT LAND MUST ACCEPT ONLY WATER FLOWING NATURALLY THERETO FROM DOMINENT ESTATE).
W71-02564 06E

SURFACE WATERS
WATER RESOURCES DATA FOR COLORADO 1969 PART 1. SURFACE WATER RECORDS.
W71-02246 07C

BUSH V CITY OF ROCHESTER (LIABILITY FOR EXPULSION OF SURFACE WATERS UPON LAND OF ANOTHER BY CONSTRUCTION OF A ROAD).
W71-02412 06E

WATER RESOURCES DATA FOR COLORADO-1968 PART 2. WATER QUALITY RECORDS.
W71-02470 02K

SURFACE-GROUNDWATER RELATIONSHIPS
THE ROLE OF UNDERGROUND FLOW IN THE WATER BALANCE OF THE USSR,
W71-02255 02A

WATER MOTION IN EARTH STRUCTURES AT VARYING WATER LEVELS IN A REACH,
W71-02269 02G

SURFACTANTS
POLYCHLORINATED BIPHENYLS (PCB) SOLUBILIZED IN WATER BY NONIONIC SURFACTANTS FOR STUDIES OF TOXITY TO AQUATIC ANIMALS,
W71-02682 05C

SURGES
EFFECTS OF PROPOSED BARRIERS ON HURRICAN SURGE HEIGHTS - REPORT 1 OF GALVESTON BAY HURRICANE SURGE STUDY,
W71-02243 08B

EFFECTS OF PROPOSED BARRIERS ON TIDES, CURRENTS, SALINITIES, AND DYE DISPERSION FOR NORMAL TIDE CONDITIONS - REPORT 2 OF GALVESTON BAY HURRICANE SURGE STUDY,
W71-02244 08B

EFFECTS OF PLAN 2 ALPHA AND PLAN 2 GAMMA BARRIERS ON TIDES, CURRENTS, SALINITIES, AND DYE DISPERSION FOR NORMAL TIDE CONDITIONS - REPORT 3 OF GALVESTON BAY HURRICANE SURGE STUDY,
W71-02245 08B

COMPUTATION OF OPEN-CHANNEL SURGES AND SHOCKS,
W71-02433 02E

SURVEYS
SEDIMENT MEASUREMENT TECHNIQUES RESERVOIR DEPOSITS,
W71-02205 02J

SNOW COVER ON THE TERRITORY OF THE USSR AS A WATER BALANCE ELEMENT,
W71-02253 02A

KITCHING V BEACHLAND DEV CO (OWNERSHIP OF LAND BETWEEN SURVEY LINE AND NAVIGABLE RIVER).
W71-02346 06E

SWAMP LANDS ACT
DUPUE ROD AND GUN CLUB V MARLIERE (VALIDITY OF TITLE TO LAKE BED OBTAINED THROUGH SWAMP LANDS ACT).
W71-02588 06E

SWAMPS
STATE V SWEET LAKE LAND AND OIL CO (TITLE TO NON-NAVIGABLE LAKE).
W71-02559 06E

DUPUE ROD AND GUN CLUB V MARLIERE (VALIDITY OF TITLE TO LAKE BED OBTAINED THROUGH SWAMP LANDS ACT).
W71-02588 06E

SWELLING PROFILE
GILGAI IN THE QUATERNARY,
W71-02505 02G

SYNERGISTIC ACTION
THE CATIONS OF THE COTTON PLANT IN SODIUM SUBSTITUTED POTASSIUM DEFICIENCY,
W71-02504 02I

SYNOPTIC ANALYSIS
THE SCALE OF OCEANIC INFLUENCE ON CONTINENTAL PRECIPITATION,
W71-02250 02A

WATER BALANCE - INDIAN OCEAN,
W71-02251 02A

A SURVEY OF WATER BALANCE PROBLEMS, PROJECTS AND PROGRESS IN ALBERTA,
W71-02458 02A

SYSTEM
FARMYARD MANURE HANDLING.
W71-02749 05D

TAIWAN
HYDROLOGY IN TAIWAN,
W71-02242 09A

W71-02283 04B

PUBLIC PROBLEMS AND NON-DECISION MAKING--A STUDY OF THE TUCSON WATER SYSTEM,
W71-02644 06E

WATER MEASUREMENT
ESSEX CO V GIBSON (MEASUREMENT OF WATER RIGHTS FOR MILL USE).
W71-02528 06E

WATER POLICY
A COMPARATIVE ANALYSIS OF AMERICAN AND CANADIAN GOVERNMENTAL ARRANGEMENTS FOR THE DEVELOPMENT OF REGIONAL WATER POLICY IN THE COLUMBIA RIVER BASIN,
W71-02499 06E

WATER POLLUTION
TECHNICAL, INTELLIGENCE, AND PROJECT INFORMATION SYSTEM FOR THE ENVIRONMENTAL HEALTH SERVICE. VOLUME IV. PESTICIDES MODEL CASE STUDY,
W71-02291 10

HARVEY REALTY CO V BOROUGH OF WALLINGFORD (RIPARIAN RIGHTS AND PROTECTION OF PUBLIC WATER SUPPLY).
W71-02314 06E

COLLINS MFG CO V WICKWIRE SPENCER STEEL CO (UPPER RIPARIAN PROPRIETOR MAY NOT POLLUTE WATER TO THE INJURY OF LOWER RIPARIAN PROPRIETOR).
W71-02324 06E

SMITH V STASO MILLING CO (DOCTRINE OF COMPARATIVE HARDSHIP NOT APPLICABLE WHERE POLLUTER FOREWARNED OF POLLUTION DANGER).
W71-02336 06E

LAUMA V BUNKER HILL AND SULLIVAN MINING AND CONCENTRATING CO (EASEMENT TO DUMP WASTES).
W71-02386 06E

CARETTI V BRORING BLDG CO (LIABILITY FOR POLLUTION OF STREAM).
W71-02424 06E

THE REMOTE SENSING OF OIL SLICKS BY RADAR,
W71-02615 05A

ANIMAL WASTE MANAGEMENT.
W71-02701 05D

REFLECTIONS ON POLLUTION CONTROL,
W71-02702 05G

WATER POLLUTION CONTROL
A HYDROLOGICAL APPROACH TO CONTROL ACID MINE POLLUTION FOR LAKE HOPE,
W71-02427 05G

STATUS REPORT ON WATER POLLUTION CONTROL FACILITIES FOR FARM ANIMAL WASTES IN THE PROVINCE OF ONTARIO,
W71-02719 05D

FEEDLOT POLLUTION CONTROL - A PROFILE FOR ACTION,
W71-02725 05G

WATER POLLUTION EFFECTS
NATIONAL ESTUARY STUDY --- VOLUME 1. MAIN REPORT.
W71-02217 02L

OIL POLLUTION OF THE OCEAN,
W71-02474 05C

HYDROCARBON POLLUTION OF EDIBLE SHELLFISH BY AN OIL SPILL,
W71-02475 05C

WATER POLLUTION SOURCES
OZARK PIPE LINE CORP V DECKER (LIABILITY FOR STREAM CONTAMINATION BY OIL).
W71-02326 06E

A HYDROLOGICAL APPROACH TO CONTROL ACID MINE POLLUTION FOR LAKE HOPE,
W71-02427 05G

OIL POLLUTION OF THE OCEAN,
W71-02474 05C

SINCLAIR REFINING CO V KEISTER (LIABILITY FOR POLLUTION OF WATER SUPPLY BY LEAKAGE OF GASOLINE TANK).
W71-02534 06E

ENGINEERING ANALYSIS OF CATTLE FEEDLOTS TO REDUCE WATER POLLUTION,
W71-02685 05D

IMPACT OF AGRICULTURAL POLLUTANTS ON WATER USES,
W71-02687 05A

WATER POTENTIAL
ATMOSPHERIC-AND SOIL-INDUCED WATER STRESSES IN PLANTS AND THEIR EFFECTS ON TRANSPIRATION AND PHOTOSYNTHESIS,
W71-02508 02D

WATER QUALITY
HYDROGEOLOGIC DATA FOR THE SOUTHWESTERN COASTAL RIVER BASINS, CONNECTICUT,
W71-02259 02E

A MODEL RELATING WATER QUALITY, VEGETATIONAL STRUCTURE AND URBANIZATION IN THE SAN JACINTO RIVER BASIN,
W71-02271 05G

COMBATTING SALT-WATER ENCROACHMENT INTO THE BISCAYE AQUIFIER -MIAMI, FLORIDA AREA,
W71-02283 04B

WATER RESOURCES DATA FOR COLORADO-1968 PART 2. WATER QUALITY RECORDS.
W71-02470 02K

REFLECTIONS ON POLLUTION CONTROL,
W71-02702 05G

CATTLE FEEDLOT WATER QUALITY HYDROLOGY,
W71-02726 05G

WATER QUALITY ACT
EFFECTS OF WATER QUALITY STANDARDS ON THE REQUIREMENTS FOR TREATMENT OF ANIMAL WASTES,
W71-02704 05G

WATER QUALITY STANDARDS
EFFECTS OF WATER QUALITY STANDARDS ON THE REQUIREMENTS FOR TREATMENT OF ANIMAL WASTES,
W71-02704 05G

WATER RATES
RATE MAKING POLICIES AND PRACTICES OF PUBLICLY OWNED WATER UTILITIES,
W71-02629 06C

WATER RESOURCE DEVELOPMENT
THE GENERAL RELATION OF TECHNOLOGIC CHANGE TO EFFICIENCY IN WATER DEVELOPMENT AND WATER MANAGEMENT,
W71-02638 06B

WATER RESOURCES
POTOMAC-SHENANDOAH RIVER BASIN COMPREHENSIVE WATER RESOURCES PLAN VOLUME 5-ENGINEERING DEVELOPMENT ALTERNATIVES.
W71-02216 06B

HYDROGEOLOGIC DATA FOR THE SOUTHWESTERN COASTAL RIVER BASINS, CONNECTICUT,
W71-02259 02E

GROUNDWATER AVAILABILITY IN FORD COUNTY,
W71-02449 02F

GEOLOGY AND GROUNDWATER RESOURCES OF LINN COUNTY, IOWA,
W71-02450 02F

DIGITAL SIMULATION OF THE OGALLALA AQUIFER IN SHERMAN COUNTY, KANSAS,
W71-02454 02F

WATER-RESOURCES INVENTORY SPRING 1968 TO SPRING 1969--ANTELOPE VALLEY-EAST KERN WATER AGENCY AREA, CALIFORNIA,
W71-02455 02E

GROUNDWATER IN MONTANA,
W71-02468 02F

BIBLIOGRAPHY OF MONTANA WATER RESOURCES AND RELATED PUBLICATIONS.
W71-02469 10

PRELIMINARY INVENTORY OF THE WATER RESOURCES OF IDAHO.
W71-02471 07C

STANDARDS FOR PLANNING WATER AND LAND RESOURCES.
W71-02665 06B

WATER RESOURCES DEVELOPMENT
GOVERNMENTAL ADMINISTRATION OF WATER RESOURCES IN THE CHICAGO METROPOLITAN AREA.
W71-02204 06E

HYDROLOGY IN TAIWAN,
W71-02242 09A

PRINCIPAL PROBLEMS OF MODERN HYDROLOGY,
W71-02248 02A

A COMPARATIVE ANALYSIS OF AMERICAN AND CANADIAN GOVERNMENTAL ARRANGEMENTS FOR THE DEVELOPMENT OF REGIONAL WATER POLICY IN THE COLUMBIA RIVER BASIN,
W71-02499 06E

A COMPREHENSIVE APPROACH FOR INDIA'S WATER RESOURCES DEVELOPMENT,
W71-02511 06B

A SUMMARY ANALYSIS OF NINETEEN TESTS OF PROPOSED EVALUATION PROCEDURES ON SELECTED WATER AND LAND RESOURCE PROJECTS.
W71-02664 06B

PRINCIPLES FOR PLANNING WATER AND LAND RESOURCES.
W71-02666 06B

WATER RESOURCES EDUCATION
INTERNATIONAL HIGHER SUMMER COURSES FOR INSTRUCTORS AND SPECIALISTS IN HYDROLOGY,
W71-02220 09A

HYDROLOGICAL EDUCATION IN CZECHOSLOVAKIA AND EASTERN EUROPE,
W71-02221 09A

HYDROLOGIC EDUCATION IN SPAIN,
W71-02222 09A

CENTRE OF APPLIED HYDROLOGY, HYDRAULICS RESEARCH INSTITUTE, FEDERAL UNIVERSITY OF RIO GRANDE DO SUL,
W71-02223 09A

HYDROLOGY IN COLOMBIA,
W71-02224 09A

EDUCATION IN HYDROLOGY IN JAPAN,
W71-02225 09A
